SELECTED WATER RESOURCES ABSTRACTS

VOLUME 9, NUMBER 13
JULY 1, 1976

The Library of the
AUG 2 1976
University of Illinois
at Urbana-Champaign

W76-06151 -- W76-06800
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates are: SWRA Journal only, $75 ($95 foreign); Journal and Annual Indexes, $100 ($125 foreign); Indexes only, $50 ($65 foreign).

Some documents abstracted in this journal can be purchased from NTIS at prices shown in the entry; prices subject to change. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 9, NUMBER 13
JULY 1, 1976

W76-06151 -- W76-06800

he Secretary of the U.S. Department of the Interior has determined that the publication of this periodical is necessary in the ransaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

THERMODYNAMIC PROPERTIES OF BULK AND OCCLUDED SUPER-COOLED WATER AND IONIC SOLUTIONS,
Purdue Univ., Lafayette, Ind. Water Resources Research Center.
C. A. Angell.
Available from the National Technical Information Service, Springfield Va 22161, as PB-251 543, $4.00 in paper $2.25 in microfiche. OWRT BI051-IND (7). Techincal Report No. 75, January 1976. 29 p, 11 fig, 20 ref.

Descriptors: *Thermodynamic behavior, *Supercooling, *Thermal capacity, *Nucleation, Crystallization, Freezing, *Physiochemical properties, Thermal properties, *Compressibilty, Infrared spectra, Emulsions, *Aqueous solution, *Water properties, Ions, Water structure, *Electrolytes, Water types, Water analysis, Analytical techniques, Infrared radiation, Measurement, Expansivity, Infrared spectra.

Techniques have been developed for performing quantitative determinations, of the heat capacity, compressibility, and near infrared spectra, of pure water, D20, and their electrolyte solutions under conditions of supercooling amounting to as much as 38C in the case of pure water and > 120C for certain concentrated electolyte solutions. In the latter cases glasses form, and some of their properties have been determined. In the case of pure water, which has been the focus of this study, remarkable anomalies are encountered in the supercooled regime. The heat capacity, compressibility, and negative expansivity are increasing exponentially with decreasing temperature according to a function which suggests the existence of a thermodynamic singularity at -45C. This phenomenon is dependent on extended water-water interactions since it is rapidly eliminated by addition of elctrolytes such as LiC1. Alternative interpretations of these phenomena are discussed, with focus on the possible existence of internal liquid phase lambda transitions associated with open hydrogen bonded networks or the existence a low temperature limit on the mechanical stability of water as a liquid phase. A concentrated aqueous electrolyte solution, 5.5 m lithium acetate, is found to form a glass for which the glass transition temperature pressure dependence is negative, the first such example on record.

2. WATER CYCLE

2A. General

LEVEL OF CLOSED BODIES OF WATER AS ONE OF THE CRITERIA OF GLOBAL WATER EXCHANGE,
Akademiya Nauk SSSR, Moscow. Institut Vodnykh Problem.
G. P. Kalinin, and R. K. Klige.
Soviet Hydrology, Selected Papers, No. 6, p 534-538, 1973. 6 fig, 7 ref. Translated from (Water Resources) Vodnyye resursy, No. 6, p 3-8, 1973.

Descriptors: *Water level fluctuations, *Lakes, *Oceans, *Humidity, Precipitation(Atmospheric), Runoff, Evaporation, Surface waters, Volume, Sea level, Water levels.
Identifiers: *Closed lakes, *USSR.

The total volume of water contained in the lakes of the earth is about 750,000 cu km and the total area of the lakes is about 2.7 million sq km. The life of these bodies of water is very closely related to the total hydrologic budget of our planet. It is natural, therefore, that the volume of lakes, their surface area, and the water level in them depend on the total humidity of the continents. This relation is most pronounced for closed lakes whose surface area is fairly large. These lakes are unique indicators of climatic variations. When the humidity of continents increases, so does the volume of closed lakes, their level rises, and their surface area increases. Conversely, the area of closed lakes decreases markedly during dry periods. An analysis of fluctuations in the level of the world's largest closed lakes showed a definite tendency toward a drop in the last century. There is a definite relation between the change in the level and volumes of the largest closed lakes and that of the World Ocean. For the ocean level regime it is practicaly immaterial whether the land water will be supplied by river or atmospheric runoff while water exchange is changing i.e., a change in runoff may have no effect on the ocean level. The situation is essentially different for lakes, since most of the moisture evaporated from the lake surface is carried beyond the limits of the lake's drainage basin. Therefore, a change in river runoff leads to a direct change in the equilibrium level of a lake. (Sims - ISWS)

METHOD FOR DETERMINATION OF DESIGN STORMS WITH LOCALLY NONUNIFORM DISTRIBUTION (VERFAHREN ZUR ERMITTLUNG EINES 'BERECHNUNGSREGENS' MIT ORTLICH UNGLEICHMAESSIGER VERTEILUNG),
F. Sieker.
Wasserwirtschaft, Vol. 65, No. 11, p 293-296, 1975. 4 fig, 1 tab, 5 ref.

Descriptors: *Design storm, *Precipitation(Atmospheric), *Statistical methods, *Rainfall, *Storm water, Mathematical models, Analytical techniques, Distribution.

Applying multi-variable statistical variance analysis design storms with locally nonuniform distribution patterns can be developed. This analysis approach takes into account the stationary nonuniform rainfall-distribution due to orographic and topographic irregularities, the ratio between longitudinal and lateral expansion of rainfall areas as well as directional effects, the rainfall-occurrence-probability related to the average intensity of that rainfall, and causally nonattachable irregularities. The method is illustrated in this article by an example using daily precipitation curves. (Loustau-FIRL)

DISTRIBUTION FUNCTIONS LIMITED AT THE ORIGIN (IM URSPRUNG BEGRENZTE VERTEILUNGSFUNKTIONEN),
P. H. Mueller, W. Traus, and H. Vahl.
Wasserwirtschaft, Vol. 65, No. 11, p 296-301, 1975. 2 fig, 7 tab, 14 ref.

Descriptors: *Statistical methods, *Mathematical studies, *Hydrology, *Time series analysis, Synthetic hydrology, Distribution.
Identifiers: *Hydrological time series.

In order to better adapt a hydrological time-series to the actual physical conditions, it is desirable to transform left limited distribution functions in such a way that they begin in the origin. A method for performing this transformation was applied to the Pearson-Type-3-Distribution and to the Extremal-Type-3-Distribution. The K-values of the distribution functions gained in this way have been computed. For the simple application of the chi squared test, the tables for the standardized density functions have also been added. (Orr-FIRL)

Descriptors: *Surface-groundwater relationships, Streamflow, *Aquifer systems, *Aquifer characteristics, *Groundwater movement, *Simulation analysis, *Model studies, Aquifers, Pumping, Flood stages, Flood flow, Return flow, Hydrology, Hydraulics, Momentum equation.
Identifiers: Pumping rates, Aquifer interaction, Kernels, Muskingum routing, Gaussian algorithm, Mathematical simulation.

An integral equation was derived which completely characterizes the interaction between a stream and the alluvial aquifer. Expressed in finite difference form, the equation was of great practical utility in solving flooding problems (i.e., negligible effect of pumping on river flows) as it relates river stages to return flows. It was also useful to solve pure conjunctive use of surface water and groundwater problems (i.e., negligible river stage fluctuations) as it relates return flows to pumping rates, or to solve composite problems. The numerical procedures to calculate the response function coefficients in terms of the physical characteristics of the system were given in detail. (Terstriep-ISWS)

HYDROLOGICAL FORECASTING PRACTICES.
World Meteorological Organization, Geneva (Switzerland). Working Group on Hydrological Forecasting.
Operational Hydrology Report No. 6, WMO - No. 425, 1975. 122 p, 35 fig, 1 tab, 158 ref.

Descriptors: *Hydrology, *Forecasting, Floods, Water resources, Flood stages, Flood forecasting, Snowmelt, Human population, Discharge(Water), Rainfall, Rivers, River flow, Rainfall-runoff relationships, Water supply, Ice, Reservoirs, Navigation, Reach(Streams), Freezing.
Identifiers: *Hydrological forecasting, Human lives, Snowmelt floods, Rainfall-induced floods, Ice break-up, River navigation.

Basic principles of, and approaches to, hydrological forecasting were summarized for readers with little previous exposure to the subject. The first three chapters included introductory material placing hydrological forecasting in the broader perspective of hydrology separate from water resources. The term was defined as a prediction of the occurrence of a hydrological event specified both with respect to its quantitative measure and its actual time of occurrence, as opposed to a statistical prediction. The data needed for forecasting were listed as raw material. The most important specific types of hydrological data were described in chapters 4 to 9. Flood forecasting was described as well as possibilities of predicting water supply within long periods of time. There was a chapter on low flows in rivers, that is, the rate at which the water supplies of a basin vanish when there is no water input. Ice phenomena on rivers and reservoirs were discussed from the river navigation standpoint. The report ended with an evaluation of the effectiveness of forecasting methods and the degree of success of operational hydrological forecasts. (Roberts - ISWS)

A GENERALIZED STREAMFLOW SIMULATION SYSTEM, CONCEPTUAL MODELING FOR DIGITAL COMPUTERS,
National Weather Service, Sacramento, Calif. River Forecast Center.
R. J. C. Burnash, R. L. Ferral, and R. A. McGuire.
Joint Report, National Weather Service and California Department of Water Resources, March 1973, 204 p, 28 fig, 12 ref, 2 append.

Descriptors: *Rainfall-runoff relationships, *Hydrologic systems, *Hydrology, *Simulation analysis, *Streamflow, *Computer models, Infiltration, Evapotranspiration, Percolation, Hydrologic cycle, Subsurface runoff, Storage, Drainage, Soil moisture, Precipitation(Atmospheric).
Identifiers: Conceptual models, *Streamflow simulation, Upper zone storage, Lower zone storage.

The hydrologic simulation model described is a conceptual system for modeling the headwater portion of the hydrologic cycle. It was based on a system of percolation, soil-moisture storage, drainage, and evapotranspiration characteristics representing significant hydrologic processes. The definition of model parameters was achieved by establishing a soil-moisture computation which allows the determination of basin stream flow from basin precipitation. Simulation was normally done using a 24-hour time increment, although a shorter increment can be used. Model parameters are physically based and can be estimated from rainfall-runoff data. The program has gone through several generations of development and has been tested on eight geographically diverse basins totaling 70 station-years of data. (Terstriep-ISWS)

SYNTHESIS OF BASIN RESPONSE WITH INADEQUATE DATA,
Osmania Univ., Warangal (India). Regional Engineering Coll.
R. Raghavendran, and P. Javarami Reddy.
Nordic Hydrology, Vol. 6, No. 1, p 14-27, 1975. 10 fig, 2 tab, 15 ref.

Descriptors: *Synthetic hydrology, *Hydrologic data, *Runoff, *Parametric hydrology, Streamflow, Model studies, Analytical techniques, Simulation analysis, Basins, Watersheds(Basins).
Identifiers: Basin response function, Inadequate data, *Hydrological analysis, Developing region, *India, Correlated basin characteristics, Discretized basin response.

The study focused on the problem of developing a basin response function with inadequate data. The case of a catchment with some measurements of output and with input data either totally absent or unemployable was specifically taken for analysis. A method proposed earlier was extended to natural catchments from 25 sq mi to 750 sq mi. It was shown that the synthesis is subjected to uncertainties and errors when the method is applied to larger catchments, though reasonably good results are obtained for smaller catchments. An alternate method applicable for all size of catchments, assuming that linearity and time are invariable and that the parameters of the model are correlated with catchment characteristics, was suggested. THE STREAM AND ITS VALLEY,
H. B. N. Hynes.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part I, p. 1-15, 1975. 4 fig., 2 tab., 72 ref.

Descriptors: *Ecosystems, *Running waters, *Watersheds(Basins), Lotic environments, Water sources, Hydrology, Transpiration, Organic matter, Litter, Vegetation, Precipitation(Atmospheric), Ions, Nutrients, Geochemistry, Productivity, Fulvic acids, Biodegradation, Leachate, Detritus.

The ecological concept of a stream and its watershed is substantiated by the latest scientific research and an overview of the interrelations between the valley and the lotic environment is presented. Among the concepts discussed is that the stream derives most of its energy from the uplands; that the source of organic matter is only indirectly dependent on vegetation litterfall, and its availability to benthic invertebrates and the biodegradation process depend on the vegetation type; and that the biotic energy that derives the stream communities begins in the form of dead material. There is evidence that decaying litter, or probably it biodegradation, take up a great deal of ionic nitrogen from the water and convert it to protein. The various inputs, sources, and transformations of organic matter are delineated. The sources of water in streams are not as generally supposed overland flow, but rather it is the soil of the valley which yields water over extend periods of time. Recent research propounds that transpiration can control stream discharge even during the non-growing season. The origin of nutrients and movement through the ecosystem, the reactions between ions and humic and fulvic acids, the temperature and climatic differences and how they affect productivity are also discussed. (Auen-Wisconsin)

THE INTERPRETATION OF THE CRYSTALLINE AND AIR BUBBLE STRUCTURES OF HAIL STONES,
Western Australia Univ., Nedlands. Dept. of Physics.
W. C. Macklin, J. N. Carras, and P. J. Rye.
Quarterly Journal of the Royal Meteorological Society, Vol. 102, No. 431, p 25-44, January 1976. 13 fig, 3 tab, 32 ref.

Descriptors: *Hail, *Cloud physics, Crystals, Bubbles, Ice, Analysis, Thunderstorms, Temperature, Meteorology.
Identifiers: *Hailstones, *Hailstone growth, Updrafts.

It is now possible to ascertain the growth histories of hailstones of approximately spherical symmetry from studies of their internal structure. Six large hailstones 4 to 6.5 cm maximum dimension, two from each of three severe storms, were analyzed. The orientation distributions and sizes of the crystals in the hailstone layers indicated that most of the growth of the hailstones took place at ambient temperatures between about -20 and -25 C, i.e., between 2.7 and 3.7 km above the freezing level. The air bubble concentrations and size distributions showed that all the hailstones grew with surface temperatures ranging from -1C for the clear layers to about -11 C for the opaque layers comprised of very small crystals. On the assumption that the median volume radius of the cloud droplet distribution was 10 micrometers, the growth of most of the hailstones took place in liquid water concentrations of about the adiabatic values. However, fluctuations in the liquid water concentration of up to some 30% were required to explain the observed air bubble and crystal structures. The fact that the hailstones grew largely between the -20 and -25 C levels indicated that they were balanced in the updraft for most of their history. (Sims-ISWS)
W76-06167

PRODUCTION OF SECONDARY ICE PARTICLES DURING THE GROWTH OF GRAUPEL BY RIMING,
Commonwealth Scientific and Industrial Research Organization, Epping (Australia), Div. of Cloud Physics.
S. C. Mossop.
Quarterly Journal of the Royal Meteorological Society, Vol. 102, No. 431, p 45-57, January 1976. 8 fig, 1 tab, 20 ref.

Descriptors: *Cloud physics, Graupel, *Rime, Laboratory tests, Particle size, Ice, Crystals, Drops(Fluids), Raindrops, Temperature, Meteorology.
Identifiers: *Ice particles, *Graupel growth, Cloud chamber, Drop size spectrum, Collection efficiency.

Experiments indicated that secondary ice crystals are produced when rime grows in a supercooled cloud containing drops greater than or equal to 24 micrometer in diameter. This occurs between temperatures of -3 and -8 C, the production rate being greatest at -5 C. These temperatures are constant to about + or -0.5 deg C for velocities of the riming body ranging from 1.4 to 3.0 m/s. On the average one ice splinter is thrown off for every 250 drops of diameter greater than or equal to 24 micrometer accreted, at cloud temperature -5 C, and this value does not change much with target velocity. Various possible splintering mechanisms were discussed. (Sims-ISWS)

Technical Note No. 138, WMO-No. 392, 1975. 127 p, 16 fig, 22 tab, 370 ref, 2 append.

Descriptors: *Droughts, *Arid lands, *Agriculture, *Meteorology, *Analytical techniques, *Land management, Water balance, Water requirements, Bibliographies, Crop response, Drought resistance, Moisture stress, Plant physiology, Weather modification, Precipitation(Atmospheric), Plant growth, Air temperature, Humidity, Soil moisture, Pest control, Diseases, Livestock.

The many meteorological facets of drought are discussed including its definition and early recognition, its effect on plants, animals, and diseases, as well as its amelioration and methods for surviving under its influence. Definitions of drought are examined according to whether they are based on rainfall only, on combinations of rainfall with temperature, humidity, wind or evaporation, on soil moisture, or on plant condition. Special attention is given to various interpretations of the water-balance equation such as the Palmer model. Agricultural practices under drought conditions are discussed including the drought resistance of plants and seeds, the use of fallow as a management technique under dry conditions, the danger of erosion of drought-affected soils, and the effects of drought on pastures and livestock. Water requirements under drought conditions are also described, and it is shown that management practices and hydrologic structures can be used to lessen the impact of drought. Although drought is generally detrimental to agriculture, it may greatly reduce economic losses from some pests and diseases. Certain agricultural practices such as wind barriers, fallowing, weather modification, evaporation suppression, and cloud seeding can influence meteorological conditions in the plant/soil environment, and may be used to advantage under drought conditions. Application of standard statistical techniques which have already been used with some success in drought studies is discussed, and some examples are given. (Robinett-Arizona)

SODIUM, POTASSIUM, CALCIUM AND MAGNESIUM CONTENT OF NORTHWEST ARKANSAS RAIN WATER IN 1973,
Arkansas Univ., Fayetteville. Dept. of Geology.
G. H. Wagner, and R. W. Holloway.
Journal of Applied Meteorology, Vol. 14, No. 4, p 578-584, June 1975. 9 fig, 5 tab, 8 ref. OWRT A-025-ARK(4).

Descriptors: *Rain water, *Chemistry of precipitation, *Arkansas, Chemistry, Rainfall, Precipitation(Atmospheric), Sodium, Potassium, Calcium, Magnesium, On-site data collections, Sampling, Meteorology.

Individual rains falling on Fayetteville, Arkansas, in 1973 were analyzed for sodium, potassium, calcium, and magnesium. Compared to a drier year, 1955-1956, the average concentrations of these elements were lower in 1973 but the fluxes higher, except calcium. Each element had a peak flux in the spring and fall, corresponding to the peaks in the amount of rainfall. Calcium concentration relative to the other elements was uniquely high during late winter and early fall suggesting more wind dependence for calcium. The elemental ratios were near those for crustal rocks, not seawater. The monthly fluxes of sodium, potassium, and magnesium were nearly constant with increasing rainfall up to six inches per month, then they increased more steeply. Calcium monthly flux increased linearly with increasing rainfall. Extrapolation of the monthly flux to zero rainfall gives a measure of the dry fallout contributed to the fluxes obtained with open collectors. Dry fallout and wet fallout (rain) were about equal. DETERMINATION OF R-Z RELATIONSHIPS FOR WEATHER RADAR USING COMPUTER OPTIMIZATION TECHNIQUES,
South Dakota School of Mines and Technology, Rapid City. Inst. of Atmospheric Sciences.
P. L. Smith, Jr., D. E. Cain, A. S. Dennis, and J. R. Miller, Jr.
Report 75-3, April 1975. 14-06-D-6660

Descriptors: *Cloud seeding, *Computer models, *Optimization, Hail, Hydrology, Precipitation, Radar, Reflectivity, Rainfall, *Weather modification, *North Dakota, Data collections.
Identifiers: R-Z relationship.

Quantitative radar data were collected from a 10-cm radar data set in western North Dakota during the summer of 1972 in connection with a randomized pilot project of cloud seeding. The radar data were recorded on magnetic tape for subsequent computer reduction and analysis. The computed radar reflectivity factors have been compared with rain gage observations collected by a network of 22 recording rain gages to obtain a relationship between hourly rainfall accumulation and the observations of the radar reflectivity factor Z. The relationship was obtained by applying a computer optimization technique resulting in the formula $Z = 155R1.88$. Comparison of point and area rainfall estimates obtained by applying this formula to estimates based on a network of 80 conventional rain gages in the area leads to the following conclusions: (1) The absolute radar calibration was maintained to within +1 dB during the summer. (2) With such accurate calibration, radar can lead to estimates of areal rainfall over the season within 10% to 15% of the rain gage estimates even using a standard R-Z relationship. (3) Some further improvement can be obtained by using an optimized R-Z relationship appropriate to the area, such that very close agreement can be obtained in terms of total rainfall accumulation over a season. (4) For operational measurement of areal rainfall by radar, corrections for evaporation and other meteorological variables will be necessary. (Bureau of Reclamation)

DEVELOPMENT OF AN EXPERIMENTAL HYDROMETEOROLOGICAL DATA COLLECTION NETWORK,
Western Scientific Services, Inc., Fort Collins, Colo.
J. H. Wagner.
Report FR-807-40, February 11, 1975. 14-06-D-7551

Descriptors: *Data collections, *Precipitation gages, *Precipitation(Atmospheric), Satellites(Artificial), Telemetry, Digital systems, Hydrometeorological station, *Remote sensing, *Networks.
Identifiers: Remote data stations, ERTS.

Two techniques for automatic collection of data from remote precipitation gages are described. Both techniques utilize a digital precipitation gage developed as a part of this program. The ERTS-RAIN concept is designed for a network of gages operating within a 12 mile radius of an ERTS Data Central. The Airborne-RAIN concept is designed for data collection from a network of gages operating over an area of several thousand square miles. Experimental systems were developed and tested in order to demonstrate the feasibility of both concepts. Recommendations for implementation of prototype networks for evaluating the operational aspects of the network are included. (Bureau of Reclamation)

EVALUATION OF AIRBORNE RAINDROP SIZE-DISTRIBUTIONS MEASUREMENTS FOR IMPROVING RADAR RAINFALL ESTIMATES,
Meteorology Research, Inc., Altadena, Calif.
T. B. Smith, D. T. Takeuchi, R. L. Peace, and S. M. Howard.
(1975), 407 p. 14-06-D-7536

Descriptors: *Weather modification, Equipment, Raindrops, Measuring instruments, Rain gages, Spectometers, Rainfall intensity, *Oklahoma, *Instrumentation, *Networks, Estimating.
Identifiers: Raindrop spectometers, Washita River watershed(Okla).

In May of 1974, an experiment was performed to evaluate the potential contribution of airborne measurements and/or surface raingages, for improving the accuracy and reliability of radar measurements of rainfall for evaluation of weather modification experiments. The aircraft was equipped with a PMS (Knollenberg) Precipitation Spectrometer Probe, a Metrodata Rain Rate Meter, and an MRI Hydrometeor Sampler for measurements of raindrop size-distributions. The principal radar used was the WSR-57 radar located at the National Severe Storms Laboratory in Norman, Okla. The raingages were those in the Agriculture Research Service Washita River watershed raingage network located southwest of Norman. The accuracy of the airborne measurements was evaluated by comparing the derived reflectivity values with the WSR-57 measurements and by comparing the computed rainfall intensity values with the surface raingage readings. (Bureau of Reclamation)

OPTIMAL SAMPLING AND OBJECTIVE ANALYSIS,
Eddy (Amos), Inc., Norman, Okla.
A. Eddy, and J. Brady.
June 27, 1975, 70 p. 14-060-D-7633

Descriptors: *Computer programs, *Rainfall, *Data processing, Climatic data, Optimization, Sampling, Instrumentation, *Model studies.
Identifiers: *Data analysis(Rainfall).

Described are three main projects, each of which centered around providing tested computer programs to the AWRM program of the Bureau of Reclamation operational on the Denver CYBER 70 computer system. Tests were conducted using Illinois State Water Survey rainfall data. (1) Optimal rainfall accumulation time and station density concepts were derived under decision constraints and observation sets input by the user. (2) Optimal interpolation objective analysis routines were implemented. These use either modelled signal and noise covariance functions or data derived covariance functions at the option of the user. (3) Sensor placement routines were provided and tested using as input simply configured shower rainfall patterns the descriptions of which are input by the user in meteorologically familiar erms. (4) A proposed sampling and analysis model is offered. This would effect an optimal combined use of radar reflectivities and surface rain gage measurements. (Bureau of Reclamation).

ICE PARTICLE MULTIPLICATION IN CUMULUS CLOUDS,
Manchester Univ. (England). Dept. of Mathematics.
R. F. Chisnell, and J. Latham.
Quarterly Journal of the Royal Meteorological Society, Vol. 102, No. 431, p 133-156, January 1976. 1 fig, 6 tab, 17 ref, 1 append.

Descriptors: *Model studies, *Cloud physics, *Ice, *Rime, Mathematical models, Drops(Fluids), Raindrops, Particle size, Crystals, Precipitation(Atmospheric), Freezing, Graupel, Stochastic processes, Mathematics, Meteorology.
Identifiers: *Ice particles, Ice splinters, Graupel growth, Drop growth.

Ice particle multiplication in shallow supercooled clouds was described by a stochastic process, which depends on collisions between ice particles and supercooled water droplets and drops. The multiplication is a consequence of the riming and drop splintering processes, or possibly just one of them. In the riming process, a large ice particle collects water droplets which eject splinters on freezing. In the drop splintering process, a supercooled drop which collides with a splinter, freezes and may eject splinters. The probability of collision between an ice splinter and a water drop was estimated by considering their fall velocities and assuming a collection efficiency of unity. As a consequence of the small and large water drop division, the ice splinters are also divided; small ice splinters collide with all water drops, but large splinters having fall velocities comparable with those of small water drops collide only with large water drops. The growth of all ice particles by diffusion of water vapor or accretion of water droplets is taken into account, splinters not captured by water drops grow to rimer status after an appropriate time. Rimers are removed from the system at the time they fall through the OC isotherm. A rimer may also be formed as a result of the freezing of a large supercooled water drop, following its collision with an ice splinter. (Sims-ISWS)

AGRICULTURAL DROUGHT OF 1972 KHARIF SEASON,
Meteorological Office, Poona (India).
C. J. George, and K. S. Ramasastri.
Indian Journal of Meteorology, Hydrology and Geophysics, Vol. 26, No. 1, p 89-96, January 1975. 8 fig, 5 ref.

Descriptors: *Droughts, *Water balance, *Indian Ocean, Climates, Networks, Crop response, Recession curves, Monsoons, Rainfall, Storms, Regional analysis.
Identifiers: *Agricultural droughts, *Kharif season, *India, Aridity index, Crop reports, Drought areas, Southwest monsoons.

The agricultural drought of the 1972 Kharif season was studied by computing weekly water balance of a selected network of stations. Weekly aridity index values above the climatic aridity index was used to identify drought incidence. The study showed that a prolonged drought spell, abating only for short periods, prevailed in the season over large areas of Madhya Maharashtra, Marathwada, Gujaret, Rajasthan, Interior Mysore and Andhra Pradesh. The findings were substantiated by reports in newspapers and crop reports of that period. (Roberts-ISWS)
W76-06681

THE MEASUREMENT AND RECORDING OF RAINFALL INTENSITIES,
J. Drabbe.
Weather, Vol. 30, No. 8, p242-247, August 1975. 3 fig.

Descriptors: *Rain gages, *Precipitation gages, *Instrumentation, Equipment, Measurement, Rainfall, Precipitation(Atmospheric), Precipitation intensity, Rainfall intensity, Meteorology.

Rainfall intensity research is useful in recording average as well as phenomenal falls, and correlating them with damage done to roads, pastures, and the general environment. To give a more detailed picture of the intensities it is better to measure the rainfall in small increments of, say, tenths of a millimeter rather than in large increments of, say, a millimeter. With these aims in mind, a completely new type of gage was designed, and built. As small amounts are difficult to measure on a bucket-type instrument, it was decided to pass the water into measuring tubes where they are automatically discharged when the meniscus touches a sensitive probe situated in the top of the tube. Two tubes are then required so as not to impede the flow of water through the system. While one tube is being filled up to its mark, the other is either discharging or has been emptied. The maximum handling capacity of the gage is 200 millimeters of rain per hour when it is measuring in tenths of one millimeter. While greater falls than 200 millimeters per hour are possible in some parts of the world, prolonged falls such as this are rare. (Sims - ISWS)
W76-06692

PRECIPITATION IN VALLEYS,
R. W. Longley.
Weather, Vol. 30, No. 9, p 294-300, September 1975. 5 fig, 5 tab, 3 ref.

Descriptors: *Rainfall disposition, *Topography, *Valleys, *Canada, Precipitation(Atmospheric), Orography, Distribution patterns, Climatology, Meteorology.

The effects of hills and mountains on the spatial distribution of rainfall have long been studied, but very little has been written on the effect of a valley on the distribution of rainfall. From the monthly records the monthly totals were abstracted for stations in the prairie provinces of Canada. Ratios were calculated for the precipitation at valley stations as compared to other nearby stations on the plains above the valley. The average ratio was 1.17 for all months and stations c ombined. For all months, the valley precipitation was always less. The ratio was minimum in July at 1.12, and maximum in December when the ratio was 1.25. (Sims - ISWS)
W76-06693

A SIMPLE RAIN-GAUGE FOR DENSE NETWORK RESEARCH,
Newport Grammar School, Essex (England).
I. J. Roper.
Weather, Vol. 30, No. 10, p329-336, October 1975. 1 fig, 2 tab, 18 ref.

Descriptors: *Rain gages, *Precipitation gages, *Instrumentation, Equipment, Rainfall, Measurement, Precipitation(Atmospheric), Winds, Correlation analysis, Regression analysis, Meteorology.

Standard Meteorological Office rain-gages are expensive, and often a cheaper acceptable substitute would be desirable, especially for dense network studies and where theft and wanton damage at sites in open agricultural land may have to be met. Such was the case when a dense network of over twenty gages was installed in the 15.4 sq km catchment of the Catchwater Drain, in East Yorkshire. As a substitute for conventional gages, plastic funnels with a 126.6 sq cm orifice (i.e. five-inch diameter), sharpened to a knife edge, were

used in conjunction with ordinary wine bottles. No attempt was made to reproduce the cylindrical shape of the Meteorological Office gage. The M.O. pattern gages have a vertical rim 11.5 cm high to stop outsplash, whereas the plastic funnels had a rim only 2.4 cm high; despite this, the latter still caught more rain. The main effect difference in design was the lower wind resistance offered by the plastic funnel gages. Although there was a variation of + or minus 4% in the daily catch, comparing the plastic gages with the standard M.O. gage, such a result could occur purely because of local chance eddies and turbulence. Thus simple plastic funnel gages would appear to offer a reliable substitute for a M.O. gage if cost represents an important consideration when deciding on the number of gages that might be used. MAXIMUM WATER EQUIVALENTS OF SNOW IN THE NORTHWESTERN REGIONS OF THE EUROPEAN USSR,
L. K. Vershinina, and V. N. Volchenko.
Soviet Hydrology, Selected Papers, No. 1, p 1-11, 1974. 5 fig, 6 tab, 12 ref. Translated from Trudy Gossudarstvennogo Gidrologicheskogo Instituta, No. 214, p 37-53, 1974.

Descriptors: *Snow, *Water equivalent, *Melt water, *Europe, Precipitation(Atmospheric), Snowfall, Snow surveys, Runoff, Runoff forecasting, Forests, Snowmelt, Snow cover, Soil moisture, Watersheds(Basins), Temporal distribution.
Identifiers: *USSR.

The water equivalent of snow accumulated over the winter is the main factor determining the magnitude of the spring flood runoff in regions deficient in moisture, since soil moisture varies little from year to year. For this reason, it is particularly important to compute the maximum water equivalents and their variations in these regions. Maps were constructed of the distribution of 22-year mean maximum water equivalent and of its variation for the field from data at 146 points. The temporal variations of maximum water equivalent were practically the same in the field and forest. This made it possible to compute the maximum water equivalent of varying probability for entire river basins, using the parameters of the distribution curves obtained for any given type of landscape, i.e., field or forest. Average snow accumulation was 10-20% higher in mixed and deciduous forests than in the field, regardless of the location of the forests in the region under study, while it was lower by 5-10% in predominantly coniferous forests because of the interception of snow by the tree crowns and its subsequent evaporation. The spacial variations of maximum water equivalent in fields and forests in the extreme west (Latvian SSR) and in the northwest (Luga River basin) were determined by the snowiness of the winter. (Sims-ISWS)

EXPERIMENT IN APPLYING CORRELATION ANALYSIS TO THE DESCRIPTION OF THE TEMPORAL VARIATIONS OF SNOW MELTING INTENSITY IN THE DON RIVER BASIN,
M. S. Dcleur, and V. A. Rumayntsev.
Soviet Hydrology, Selected Papers, No. 1, p 12-16, 1974. 2 fig, 2 ref. Translated from Trudy Gossudarstvennogo Gidrologicheskogo Instituta, No. 214, p 54-60, 1974.

Descriptors: *Snowmelt, *Snow, Melting, *Temporal distribution, *Correlation analysis, Statistical methods, Snowfall, Melt water, Thawing, Runoff, Timing.
Identifiers: *USSR, *Melting rates, *Don River Basin(USSR).

It is important to know the space-time variations of various hydrometeorological characteristics to solve some practical problems and for forecasting purposes. Of particular interest is the snow melting rate, whose behavior in time and space is usually disordered and largely random. For this reason, the variations in melting rate can be described only statistically. Results were reported of a correlation analysis of the temporal variations of the snow melting rate in the Don River basin. A fairly high time correlation between the daily snow melting rates with a shift of 1-2 days was established. The correlation functions were shown to be inhomogeneous for different years. A relation was obtained between the terms of time correlation functions and elevation. It is suggested that a discrete first-order autoregression process be used as a model of the generating process for the snow melting rate. It was found from the model of the autoregression process for the years under study that a linear forecast of the snow melting rate is unsatisfactory, even for a forecast one day in advance. (Sims-ISWS)
W76-06173

DETERMINATION OF THE DATES OF SNOW DISAPPEARANCE IN THE FOREST,
S. B. Deribizova.
Soviet Hydrology, Selected Papers, No. 1, p 17-22, 1974. 1 fig, 3 tab, 13 ref. Translated from Trudy Gossudarstvennogo Gidrologicheskogo Instituta, No. 214, p 61-69, 1974.

Descriptors: *Snow, *Melting, *Forests, Timing, Temperature, Water equivalent, Precipitation(Atmospheric), Snowfall, Snowmelt, Deciduous forests, Coniferous forests.
Identifiers: *USSR.

The dates of the disappearance of the main mass of snow from fields and forests in drainage basins must be known to analyze the conditions of spring flood runoff formation. This makes it possible to estimate the part played by precipitation before and after the disappearance of snow, as well as that of evaporation and other factors in the formation of flood runoff. The station network observes the disappearance of snow only in fields within the visible range of the station surroundings. For this reason, the data on snow disappearance in forests must be determined by computation. The dates of snow disappearance in forests can be reliably computed from snow melting coefficients (mm per degree of positive air temperature) that are constant for each spring and from a typical areal snow distribution curve. In mass computations, the dates of snow disappearance in forests can be determined from the date of occurence of maximum discharges for rivers with a basin area of 2-10,000 sq km that are more than 60% wooded. The computed dates of snow disappearance make it possible to analyze the conditions of spring flood runoff formation during the melting period and the snowless part of the flood. (Sims-ISWS)

MEASUREMENT OF SMALL STRAIN-RATES OVER SHORT TIME PERIODS,
Department of the Environment, Ottawa (Ontario). Inland Waters Directorate; and Department of the Environment, Ottawa (Ontario). Glaciology Div.
G. Holdsworth.
Journal of Glaciology, Vol. 14, No. 71, p 317-324, 1975. 7fig, 3 ref.

Descriptors: *Instrumentation, *Strain measurement, *Ice, Strain, Strain gages, Glaciers, Measurement, Physical properties, Equipment, On-site investigations, Glaciology.
Identifiers: *Laser interferometers.

A laser interferometer has been used to measure small relative displacements between two reference points spaced up to 99.76 m apart and fixed in an ice surface. Strain-rates of order 10 to the minus 11th power/s can be detected easily within a 24 h period and possibly within an 8 h period. Application of this system could be extended to sea or lake ice provided the mounting posts are redesigned. The laser unit operates successfully at air temperatures below 0 C. Under enclosed conditions or in stable air without precipitation, the maximum practical distance between the interferometer and the reflector is about 100 m, with the laser output gain at the highest level. (Sims - ISWS)

ORIENTATION OF SOIL STRIPES CAUSED BY NEEDLE ICE,
British Columbia Univ., Vancouver. Dept. of Geography; and British Columbia Univ., Dept. of Geological Sciences.
J. R. Mackay, and W. H. Mathews.
Journal of Glaciology, Vol. 14, No. 71, p 329-331, 1975. 1 fig, 9 ref.

Descriptors: *Ice, *Soils, Thawing, Melting, Solar radiation, Soil water, Soil moisture.
Identifiers: *Needle ice, Soil stripes.

Orientation of striping caused by needle ice has been ascribed in the past to (1) wind direction during soil freezing, and (2) azimuth of the sun during thawing. Recent evidence supported the latter concept. Needle-ice striped ground can be shown to result as a thaw phenomenon by direct observation, by controlled and natural shading which prevents stripe growth, and by experiments with a heat lamp to cause striping. SEDIMENTS EXPOSED ON THE SURFACE OF THE ROSS ICE SHELF, ANTARCTICA,
Nebraska Univ., Lincoln. Ross Ice Shelf Project.
D. R. Gaylord, and J. D. Robertson.
Journal of Glaciology, Vol. 14, No. 71, p 332-333, 1975. 1 fig, 1 ref. NSF GV-4073X, GV-39639.

Descriptors: *Sediments, *Ice cover, *Antarctic, Glaciers, Ice, Sedimentology, Glaciology.
Identifiers: *Ross Ice Shelf(Antarctica), Ice shelves.

A highly crevassed region near a grounded ice rise on the Ross Ice Shelf, Antarctica, was investigated and found to contain poorly sorted sediments. Preliminary analysis of a 27 g sample of sediments was undertaken using megascopic, microscopic, and X-ray diffraction methods. Igneous and metamorphic rock fragments, their constituent minerals, and micro-fossils were noted in the sample. Insufficient data have been collected at this time to denote a particular source area for the sediments. (Sims-ISWS)

SNOW AVALANCHE HAZARD IN THE UNITED STATES: A RESEARCH ASSESSMENT.
Colorado Univ., Boulder, Inst. of Behavioral Science.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-242 980, $5.50 in paper copy, $2.25 in microfiche. Monograph NSF-RA-E-75-017, 1975. 86 p, 13 fig, 10 tab, 54 ref. NSF GI-32942.

Descriptors: *Avalanches, *Snow, *Snow management, Snowpacks, Hazards, Safety, Control, Snow cover, Snow cornice, Winter sports, Skiing, Damages, Explosions, Forests, Mountains, Construction, Structures, *Research priorities, Evaluation.

In recent years, research to find effective ways of dealing with avalanche hazards has intensified. In spite of these efforts, the risk to population and property continues to increase in harmony with the movement of population to mountain recreation areas of the western United States. With greater risk should come increasing support to research aimed at aleviating the hazard to people and property. Construction of control works is limited by the availability of suitable sites and by environmental costs. Among the various adjustments, control and protection can be undertaken with the greatest confidence that the anticipated reduction in risk will be achieved either by more reliable techniques or by more efficient application. More reliable avalanche warning would have the obvious benefits of reduced risk and loss, especially in the case of short-term warnings of potential occurrences along highways and in ski areas. If avalanche risk zones can be adequately identified, land use regulations can be created which will require that development be commensurate with the level of risk. Such regulations should lead to loss reduction in the long run; for this risk mapping is essential. (Sims- ISWS)

DETERMINATION OF SNOW DEPTH AND SNOW EXTENT FROM NOAA 2 SATELLITE VERY HIGH RESOLUTION RADIOMETER DATA,
National Environmental Satellite Service, Washington, D.C.
D. F. McGinnis, Jr., J. A. Pritchard, and D. R. Wiesnet.
Water Resources Research, Vol. 11, No. 6, p 897-902, December 1975. 6 fig, 5 ref.

Descriptors: *Satellites(Artificial), *Snow, *Snow cover, *Remote sensing, Reflectance, Regression analysis, Precipitation(Atmospheric), Snowpacks, Data processing.
Identifiers: *Snow depth, Brightness, Very high resolution radiometer.

The NOAA 2 environmental satellite and subsequent environmental satellites provide daily coverage of the earth in the visible (0.6-0.7 micrometer) and thermal (10.5-12.5 micrometer) spectral bands. The ground resolution of the very high resolution radiometer is 1 km at nadir. This improved resolution in the visible spectral band permits more detailed observations of snow features than were possible with the previous operational satellites. A visible band image from February 11, 1973, depicted the heavy snow cover in considerable detail in areas from Alabama to North Carolina. Digitized reflectance data from the study area were compared with prestorm bare ground digitized reflectance data of February 6, 1973, to examine the relation of snow reflectivity to snow depths. A regression analysis of greatest brightness versus greatest snow depth for 201 data pairs produced a power correlation coefficient of 0.86. Reflectance values from snow deeper than 30 cm tended to be uniformly high; values from snow less than 30 cm tended to increase rapidly as snow depth increased. (Jones - ISWS)

A METHOD FOR ESTIMATING SNOWFALL AMOUNTS,
Oregon State Univ., Corvallis. Dept. of Forest Engineering.
R. L. Beschta.
Water Resources Bulletin, Vol. 11, No. 6, p 1209-1219, December 1975. 5 fig, 3 tab, 17 ref.

Descriptors: *Snowfall, *Estimating, *Snow, *Statistical methods, Temperature, Precipitation(Atmospheric), Climatic data, Regression analysis, Snow cover, Geomorphology.
Identifiers: *Snowfall index, Snow density, Snow load, Snow accumulation, Scatter diagrams.

Long-term climatic data from National Weather Service stations in six areas of the United States were utilized to develop regression equations relating a 'snowfall index' parameter and air temperature. Nearly 200 stations, representing a wide range in physiographic and climatic conditions, were selected for analysis. Snowfall index was defined as the ratio of snowfall depth to precipitation. Using annual data, regression analysis indicated snowfall index to be significantly (alpha=0.01) related to temperature for five of the six areas studied. Differences between equations were attributed to the effects of precipitation and temperature during non-snowfall periods. Mean monthly data were also considered and significant equations (alpha=0.01), representing a family of similarly shaped curves, were obtained. The illustrated equations can be used for estimating mean monthly and annual snowfall amounts for stations having only temperature and precipitation measurements. (Jones-ISWS)

Report INSTAAR-14-06-7155-3, December 1974, 141 p. 14-06-D-7155

Descriptors: *Avalanches, *Forecasting, Snow, Snowpacks, Precipitation(Atmospheric), Hazards, Precipitation rate, Monitoring, *Colorado, *Methodology.
Identifiers: Snow formation, *San Juan Mountains(Colo).

Avalanche initiation is under study by analyzing the complex relationships among terrain, climate, and snow stratigraphy. Air and snowpack temperatures, wind speed and direction, precipitation rate and amount, snow settlement rate, net all-wave radiation at the snow surface, and snow density and water equivalent values are measured at the prime study site at Red Mountain Pass (3400 m). Climatological data are also collected routinely in Silverton (2830 m) and at the Rainbow site (3490 m) adjacent to the starting zones of the Brooklyns avalanche paths. Avalanche events are monitored by direct observation and by trip wires on selected paths. During the third winter, emphasis was placed on the development of the snow stratigraphy; abundant snow pit data were acquired from standard level snow study sites, from test slopes similar to avalanche release zones, and from avalanche fracture lines. Avalanche hazard forecasts based on weather and snowpack conditions were made daily. In addition, work began on a statistical model to forecast avalanche occurrence. (Bureau of Reclamation)

Descriptors: *Ice, *Ice cover, *Climatology, Weather forecasting, Future planning(Projected), Meteorology, Hydrology, Meteorological data, Hydrologic data, Air temperature, Great Lakes Region, *Michigan, Forecasting.
Identifiers: *Ice forecast, *Forecast procedures, Little Rapids Cut(Mich), St. Mary's River(Mich).

An operational 5-day forecast procedure is presented for predicting the initial date of ice-related problems at the Little Rapids Cut and the continuing degree of difficulty the Sugar Island Ferry would experience in crossing the St. Marys River at that point. The forecast procedures were developed by use of meteorological and hydrological data, aerial photographs of ice cover, and time lapse films of the motion of jammed ice toward the Sugar Island ferry crossing. Ice problems had generally begun within 10 days after the water temperature in the river had reached 32F. Once ice problems began, the degree of difficulty in crossing the river, expressed in three probability categories, was forecast daily, based upon air temperatures, upstream ice cover, and shipping activity. Results of the operational-experimental forecast of the onset date of problems during the 1974-75 winter are presented. With the continuation of shipping and accumulation of over 850 freezing degree-days, the Sugar Island ferry was often not able to cross the river without ice-breaker assistance. (NOAA)

DEVELOPMENT OF SNOW WATER EQUIVALENT SURVEY METHODS USING AIRBORNE GAMMA MEASUREMENTS,
EG and G, Inc., Las Vegas, Nev.
A. Fritzsche, and C. Juniper.
Report No. EGG-1183-1677, 24 p, 3 fig, 2 tab, Nov 1975. EGG-1183-1677, No. E(29-11-1183).

Descriptors: *Surveys, *Snow surveys, *Hydrologic data, *Measurements, Hydrology, Snow, Snowmelt, Water equivalent, Soil moisture, *Remote sensing.
Identifiers: *Gamma measurements, *Airborne gamma measurements, Snow water, Snow water equivalent, Soil moisture surveys.

A summary is presented of the progress made during the period March 1975 through September 1975 on EG and G's support of NOAA for development of airborne techniques for measurement of the water equivalent of snow and soil moisture. The work included a series of snow and soil moisture surveys and development of a new detector and data acquisition system. Plans for the immediate future are reviewed. In addition, suggestions for other future work are discussed and recommendations made. (NOAA)

SNOW WATER EQUIVALENT SURVEYS OF THE SOURIS RIVER BASIN,
EG and G, Inc., Las Vegas, Nev.
A. E. Fritzsche, and E. L. Feimster.
Rpt. No. EGG-1183-1668, November 1975. 44 p, 1 fig, 10 tab, 8 ref, 4 append. E(29-11-1183),

Descriptors: *Water measurement, *Snow, *Snow surveys, *Water equivalent, Snowmelt, Hydrologic data, Hydrology, Canada, North Dakota.
Identifiers: Snow water, Snow water equivalent, *Snow water equivalent surveys, Gamma fluence, Bare ground surveys, *Souris River Basin(N Dak-Can).

Three airborne surveys, employing the measurement of the natural terrestrial gamma radiation to determine the water equivalent of snow cover, were conducted over the Souris River Basin in Saskatchewan, Canada, and North Dakota, in the fall and winter of 1974-75. This airborne survey method used the attenuation of the natural terrestrial gamma fluence rate (flux) to measure the water equivalent of snow on the earth's surface. Twenty-three survey lines (12 in North Dakota and 11 in Saskatchewan) were chosen as adequate coverage of the Souris River Basin. Snow water equivalent results are reported for each of the 23 sub-basins. (NOAA)

2D. Evaporation and Transpiration

EFFECTS OF WATER STRESS ON LEAF RESPIRATION, TRANSPIRATION RATES IN THE DARK AND CUTICULAR RESISTANCE TO WATER VAPOR DIFFUSION OF TWO CORN INBREDS,
Laval Univ., Dept. of Phytotechnie, Quebec.
P. A. Dube, K. R. Stevenson, G. W. Thurtell, and R. B. Hunter.
Canadian Journal of Plant Science, Vol. 55, p 565-572, April, 1975. 4 fig, 1 tab, 24 ref.

Descriptors: *Moisture stress, *Plant physiology, *Transpiration, *Respiration, *Corn(Field), Plant growth, Drought tolerence, Moisture tension, Osmotic pressure, Water requirements, Plant tissues, Leaves, Stomata, Water vapor, Crop production.
Identifiers: *Cuticular resistance, Water vapor diffusion, Zea mays L. Q188, Zea mays L. DR1, Dark transpiration.

Growth chamber studies on 2 lines of corn (Zea mays L.), a wilting inbred line (Q188) and an inbred line known to have at least some heat and drought tolerance (DR1), indicated differences in dark transpiration and the magnitude of cuticular resistances to water vapor diffusion. Q188 had greater dark transpiration than DR1 and both showed decreased transpiration as leaf water potentials decreased. Cuticular resistance to water vapor diffusion was initially higher in DR1 and increased at a faster rate than in Q188 as the drying cycle progressed. Incomplete recovery in leaf water potential was observed in both lines upon watering after severe desiccation. No differences were found in leaf respiration rates between the inbreds. CHANGES IN CLIMATE AND ESTIMATED EVAPORATION ACROSS A LARGE IRRIGATED AREA IN IDAHO,
Wyoming Univ., Laramie. Dept. of Agricultural Engineering.
R. D. Burman, J. L. Wright, and M. E. Jensen.
Transactions of the American Society of Agricultural Engineers, Vol. 18, No. 6, p 1089-1093, November-December 1975. 7 fig, 3 tab, 16 ref.

Descriptors: *Evaporation, *Irrigation, *Climates, *Idaho, Estimating, Advection, Crops, Irrigated land, Evapotranspiration, Temperature, Precipitation(Atmospheric), Sagebrush, Winds, Humidity, Diurnal, Vapor pressure, Wind velocity, Climatology.
Identifiers: *Climatic change, *Estimated evaporation, Irrigated crops, Climatological study, Hygrothermographs, Steppe climate.

Ground level climatic measurements were taken along a 50 km transect going from dry sagebrush land into the center of a large irrigated area in southern Idaho. Measurements in May, when the desert area was dry, indicated that climatic changes across the transect were minimal. In August, when the desert was obviously very dry, air temperatures decreased, vapor pressure increased, and windspeed was reduced about 40% within the irrigated area. The results demonstrated that any weather service agency or group must consider the distance from dry surroundings when selecting sites that are to be representative of climatic conditions over irrigated fields. (Roberts-ISWS)

METHOD FOR COMPUTING EVAPORATION DURING THE SNOW MELTING AND FLOOD PERIOD IN THE CENTRAL CHERNOZEM REGIONS OF THE EUROPEAN USSR,
A. N. Postnikov.
Soviet Hydrology, Selected Papers, No. 1, p 23-31, 1974. 2 fig, 9 tab, 8 ref. Translated from State Hydrologic Institute (Trudy GGI), No. 214, p 70-83, 1974.

Descriptors: *Evaporation, *Snowmelt, Soils, Flood peak, Moisture, Spring, Evaporimeters, Precipitation(Atmospheric), Soil horizons, Probability, Radiation, Grasslands, Forests.
Identifiers: *Central Chernozem regions, *Flood period, *European USSR, *USSR, Forest-steppe, Forest zone, Spring flood.

Evaporation is fairly high during the spring flood period in the forest-steppe and forest zones of European USSR. It amounts to 10-70% of the sum of water equivalent and precipitation in certain years. Evaporation from the surface of drainage basins must be taken into account in hydrologic budget studies and in the analysis and computation of spring flood runoff. Since it is difficult to measure evaporation directly in spring, and at only a few limited places, it becomes necessary to develop simple methods for computing evaporation from meteorological data. An attempt was made to establish a relation between evaporation during the spring flood period and the total air moisture deficit over this period. Observations were made with evaporimeters evenly distributed over the Don River basin. They were filled when snow started melting, weighed every 5 days, and refilled every 10 days. It was concluded that during the spring flood period, the upper soil layers had a moisture content close to or exceeding minimum moisture capacity after the disappearance of snow. It was also concluded that evaporation from basin surfaces during snow melting may be computed by the formula: E = 0.44 Sigma d, where d is the daily moisture deficit in mb. During the remainder of the spring flood period the formula is: E = 1.1(Sigma d) 0.82. (Roberts-ISWS)

FACTORS ALTERING THE MICROCLIMATE IN CARLSBAD CAVERNS, NEW MEXICO,
Geological Survey, Albuquerque, N. Mex.
J. S. McLean.
Open-file report 76-171, February 1976. 56 p, 33 fig, 4 tab, 10 ref.

Descriptors: *Evaporation, *Caves, *Karst Hydrology, *New Mexico, *Data collections, Monitoring, Temperature, Humidity, Carbon dioxide, Air, Evaporation pans, Water levels, Underground streams, Lighting, Least squares method, Equations, Evaluation.
Identifiers: *Carlsbad Caverns(N Mex).

In 1968, the U.S. Geological Survey began a cooperative program with the National Park Service to study the microclimate in Carlsbad Caverns, N. Mex., to determine ways of reducing excess evaporation from the cave pools and restoring the cave microclimate to more nearly natural conditions. Revolving doors installed during the summer of 1972 at the bottom of the elevator shaft reduced airflow up the elevator shaft which in turn reduced the net evaporation in the cave at least 10 percent. Evaporation pans near the elevator shaft showed a 34 percent average decrease in the annual evaporation rate. Annual evaporation at most locations remote from the elevator shaft increased an average of 23 percent. It is assumed that the increase in evaporation in remote areas of the cave is caused by the heat output resulting from energy consumption for lighting. An analysis using least-squares equations indicated that part of the evaporation at four of the nine evaporatiou pans can be correlated with energy consumption and may represent an average of 23 percent of total evaporation at these locations. (Woodard-USGS)

USING EVAPORATION VALUES FROM EVAPORATION PANS TO ESTIMATE THE WATER CONSUMPTION OF AGRICULTURAL PLANTS AS THE BASIS OF SPRINKLER IRRIGATION CONTROL, (IN GERMAN),
W. Schaefer, and R. Koitzsch.
Arch Ackerpflanzenbau Bodenkd 19(5); p 365-374, 1975.

Descriptors: *Evaporation, *Evapotranspiration, Water consumption, Sprinkler irrigation, Wheat, Potatoes, Sugar beets, Corn(Field), Transpiration.

Evaporation of a free water surface and evapotranspiration of a plant stand sufficiently supplied with water are governed by similar physical processes. The values of potential evaporation (evaporation in pans) may be used for controlling sprinkler irrigation. During the dry seasons of 1971 and 1973, early potatoes, green maize, spring wheat and sugar beet produced the same yield increase with sprinkling control on the basis of pan evaporation values and with control by the estimation method according to Klatt.--Copyright 1975, Biological Abstracts, Inc.

B. A. Fidman, A. S. Orlov, and V. S. Morozenkov.
Soviet Hydrology, Selected Papers, No. 6, p 551-560, 1973. 8 fig, 10 ref. Translated from (Water Resources) Vodnyye resursy, No. 6, p 107-117, 1973.

Descriptors: *Flow, *Streamflow, *Rivers, *Model studies, Mathematical models, Measurement, *Turbulence, Velocity, Instrumentation, Profiles, Flow profiles, Hydrology.
Identifiers: Velocity pulsations.

An analysis of the method of measuring river turbulence and the results obtained showed that the developed equipment is suitable for field investigations of flow characteristics, determined by the large-scale component of longitudinal velocity. The proposed relations permitted estimating the error and selecting optimum measurement conditions. The results of the measurements confirmed the presence of a standard deviation profile of longitudinal pulsations, referred to dynamic velocity, close to the universal profile, but gave no reason to believe that disturbances of a scale exceeding depth exist in the structure. Descriptors: *Periphyton, *Zoobenthos, Diatoms, Algae Chlorophyll, *Analysis, Fish populations, Trout, Brook trout, Europe.
Identifiers: Beskid Mts., Czechoslovakia.

Collections from trout brooks in the Beskid Mountains, Czechoslovakia included 29 spp. from the periphyton and 138 spp. from the zoobenthos. The species composition of natural and artificial substrata was similar and was predominantly of diatoms. Significant correlations between abundance of algae quantity of organic matter and quantity of chlorophyll A, were found. Average gross primary production of the artificial substratum was 60.3 mg O2/m2/h. Development of periphyton was influenced by discharge rates of water and local light conditions. Insect groups comprising the zoobenthos were assessed in terms of numbers, weight and production. Changes in discharge rates, speed of streaming, temperature and conversion from pools to torrential zones, influenced distribution of the fauna. Different fishstocks did not appear to affect composition of the zoobenthos. Furthermore, excessive fishstock did not substantially effect its quantity and composition.--Copyright 1975, Biological Abstracts, Inc.

FLOOD PLAIN MAPPING,
Hydrocomp, Inc., Palo Alto, Calif.
R. K. Linsley.
Simulation Network Newsletter, Vol. 7, No. 4, p 1-8, May 15, 1975. 5 fig, 1 tab, 10 ref.

Descriptors: *Simulation analysis, *Flood forecasting, *Hydrology, Rainfall, Data collections, Model studies, Watershed management, Streamflow forecasting, Computers.

In order to set premiums for flood insurance, continuous simulation computer models are specifying the various levels of probability of flooding. Conventional hydrology in flood plain mapping has the problems of limited data, inadequacy of the design rainfall approach, and limitations from assumptions and simplifications. Continuous simulation transforms a long series of rainfall data into streamflow by algorithm representing the hydrologic processes. With sufficient rainfall data, the output is continuous without assuming any specific design rainfall. Probability analysis of this data defines flood levels throughout the watershed without invoking the assumptions inherent in use of backwater methods. The Hydrocomp Simulation Program is adapted to a particular watershed by adjusting parameters such as overland flow slope and length, extent of vegetative cover, and stream pattern in the watershed and area. For ungaged watersheds the parameters are estimated from adjacent gaged watersheds. Where conditions within the watershed vary substantially, it is subdivided into segments with a separate set of parameters for each segment. The data analysis is obtained from the National Weather Service and the U.S. Geological Survey. (Loustau-FIRL)

THE BLACK HILLS (SOUTH DAKOTA) FLOOD OF JUNE 1972: IMPACTS AND IMPLICATIONS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
H. K. Orr.
General Technical Report RM-2, March 1973. 12 p. 17 fig, 4 tab, 4 ref.

Descriptors: *Historic flood, *Flood damage, *Hydrologic aspects, *Excessive precipitation, Flash floods, Flood disasters, *South Dakota.
Identifiers: *Black Hills(S Dak), Hydrologic conditions, Record rainfall.

Rains of 12 inches or more in 6 hours fell on the east slopes of the Black Hills the night of June 9, 1972. Resulting flash floods exacted a disastrous toll in human life and property. Rainfall and discharge so greatly exceeded previous records that recurrence intervals have been presented in terms of multiples of the estimated 50- or 100-year event. Quick runoff was produced in the heaviest rainfall areas regardless of hydrologic condition. Flood sources included all major geologic and soil types and practically all land uses in the Black Hills. The highest measured peak runoff per unit area came from a 7-square-mile drainage, all of sedimentary formations, the upper portion of which burned over in 1936, but which is now well vegetated, apparently stable, and in good hydrologic condition. Greatest damage occurred where man-origin debris piled up against bridges, highways, homes, and other improvements. (Forest Service)

Technical Bulletin No. 85, 1975, 49p, 33 fig, 18 ref, append.

Descriptors: *Floods, *Snow, *Precipitation(Atmospheric), Geology, Analysis, Investigations, Snowmelt, Washouts, *Alaska, Flow rates.
Identifiers: *Fort Nelson River, *Muskwa River, Alaska Highway.

On June 16, 1971, runoff from heavy precipitation, combined with river channels already bankfull from snowmelt runoff, produced floods in the Muskwa River and Fort Nelson River Valleys of northern British Columbia. The instantaneous maximum flow of the Fort Nelson River near the Town of Fort Nelson has been estimated at 234,000 cfs, the largest flow since records began in 1961. The instantaneous maximum flow of the Muskwa River near Fort Nelson has been estimated at 165,000 cfs, the largest flow since records began in 1944. (Environment Canada)

METHOD FOR REDUCING SINGLE DISCHARGE MEASUREMENTS TO THE AVERAGE DISCHARGE OF THE LOW-FLOW PERIOD,
B. L. Sokolov.
Soviet Hydrology, Selected Papers, No. 4, p 235-241, 1974. 5 fig, 1 tab, 6 ref. Translated from Transactions of the State Hydrologic Institute (Trudy GGI), No. 213, p 171-181, 1974.

Descriptors: *Discharge(Water), *Base flow, *Streamflow, Data processing, Hydrogeology, Groundwater movement, Flow, Rivers, Streams, Hydrology.

Using conversion factors, single discharge measurements were reduced to the average discharge over periods when a river is fed only by groundwaters. The values of the conversion factors K are computed from the data of permanent gaging stations of the Hydrometeorological Service as the quotient of the division of the average discharge (discharge rate) over the low-flow period by the measured discharge. Several permanent observation stations were used as analog gaging stations on the principle of similarity of physiographic conditions, i.e., hydrogeological structure, drainage area, woodedness, waterlogging, etc. The arithmetic mean of the factor K, determined from several analog gaging stations (usually 2-3), was used as the final value. This proposed method is more justified for the Onega-Northern Dvina interfluve than the available methods because it allows for the effect of physiographic conditions on the patterns of variation of conversion factors and also because this factor is assigned on the basis of virtually all information on the water regime dur-

ing the summer-autumn period. This makes it unnecessary to search in each specific case for suitable analogs, which are selected on the basis of qualitative considerations of similarity of natural conditions in the basins and frequently mechanically from the agreement between conversion factors. Identifiers: Water-air content, *Vertical column model, *Sand column model.

When both water and air movements are included in the formulation of infiltration or drainage problems, the problems of infiltration and drainage exhibit a natural symmetry. Methods of solution for one problem are applicable to the other type of problem. An equation of drainage was derived and it had precisely the same functional form as the equation derived for infiltration in a previous paper. (Prickett-ISWS)

Descriptors: *Isotope studies, *Surface waters, *Groundwater, *Radioactive dating, *Tracking techniques, Groundwater recharge, Dating, Age, Tracers, Analytical techniques, Oxygen isotopes, Carbon radioisotopes, Stable isotopes, Radioisotopes, Background radiation.
Identifiers: *Argentina, Water origin, Flow direction, Infiltration areas, Recharge areas, Carbon 14, Oxygen 18, Natural isotopes.

The naturally occurring isotopes radiocarbon, stable carbon-13 and oxygen-18 have been studied in surface and groundwater from six regions in Argentina. The 018 content of river and groundwater was used to trace the origin of the water, using its relation with altitude of the catchment area. The C14 ages obtained for groundwater range from recent to about 30,000 years and clearly indicate the direction of flow in some areas. Flow velocities of 3 to 10 m/year were found. (Prickett - ISWS)

Identifiers: *Southern Coastal Plain, *Atlantic Flatwoods, *Grid system.

Shallow Quaternary aquifers, which are underlaid by relatively tight materials, are especially important in the Southern Coastal Plain. These sandy materials cause a large percentage of the precipitation to infiltrate, move laterally, and run off as return flow to ponds, pits, and streams. Quantitative methods for computing and expressing shallow groundwater volume and distribution within a watershed were discussed and compared. A grid method to subdivide the watershed into subareas for computing groundwater storage was found suited to all groundwater conditions, whereas, other techniques tested required a constant area. A pond and watershed water balance was made for 13 periods to exercise the principles suggested. The pond water balance showed a groundwater loss eight of the 13 periods; however, there was a total net groundwater gain of 0.82 acre-foot. A watershed water balance was made for the same periods using the computed groundwater seepage. The residual for this water balance was soil water, which showed a net gain of 1.36 area-inches. These techniques and descriptions will permit the routing of both surface and subsurface water through a watershed and will assign quantitative values to the hydrologic processes. (Visocky-ISWS)

MODELING TECHNIQUES FOR GROUNDWATER EVALUATION,
Illinois State Water Survey, Urbana.
T. A. Prickett.
In: Advances in Hydroscience, Volume 10-1975. Academic Press, New York, New York, p 1-143, 1975. 69 fig, 6 tab, 332 ref.

Descriptors: *Groundwater, *Model studies, *Analog models, *Computer models, Mathematical models, Resistance networks, Hybrid computers, Finite element analysis, Computer programs, Numerical analysis, Analytical techniques, Simulation analysis, Aquifers, Groundwater movement.
Identifiers: *Groundwater basin management, *Groundwater reservoirs, *Sand tank models, Groundwater evaluation.

The most frequently cited differential equations governing the flow of groundwater were outlined. The presentation of these equations introduced common nomenclature. The modeling techniques were then outlined under the groups of analogs, analytical and numerical techniques, and sand tank models. Each section included the basic theory, a brief background of the available literature, derivation of formulas, scale factor definition when necessary, a case history when ap-

propriate, model verification procedures, and a discussion of advantages, disadvantages, and errors. References were grouped by subject matter at the end of the article and thus depart from the usual single alphabetical listing. The reference section has subject matter headings identical with those of the text. The reference list is extensive, containing papers not necessarily cited in the text. This was done so that the reader would have a more complete bibliography for further research if desired. Although studies of individual well hydraulics were mentioned, the emphasis was given to regional groundwater resource evaluation. Details have been purposely omitted since they can be found in the literature. (See also W76-06412) (Pricket-ISWS)

HYDROTHERMAL CONVECTION IN SATURATED POROUS MEDIA,
Bordeaux-1 Univ., Talence (France).
M. A. Combarnous, and S. A. Bories.
In: Advances in Hydroscience, Volume 10-1975, Academic Press, New York, New York, p 231-307, 1975. 60 fig, 1 tab, 86 ref.

Descriptors: *Porous media, *Aquifers, *Heat transfer, *Model studies, Theoretical analysis, Laboratory tests, Thermal water, Geothermal studies, Subsurface waters, Convection, Mixing, Temperature, Thermal properties, Snow cover, Aquifer characteristics, Boundaries(Surfaces), Boundary processes, Dimensional analysis, Mathematical studies, Numerical analysis, Saturated flow, Groundwater movement.
Identifiers: Hydrothermal convection, Thermohaline convection.

Generally speaking, convective movements in a porous layer have two main effects. They first tend to homogenize the whole fluid volume where they take place. They also help produce a nonuniform in situ temperature distribution characterized by hot and cold zones. Thermal convection in aquifers must be taken into account for: (1) the contribution of the 'homogenizing effects' of convective movements to the spreading of a pollutant, (2) the influence on the efficiency of industrial plants using hot deep-lying groundwater, and (3) the influence of a nonuniform temperature field resulting from convection in infrared photographic exploration. Subject areas presented were heat transfer in porous media, mathematical formulations for thermal convection, theoretical approaches, experimental results for free convection in horizontal layers, free convection in sloped areas, numerical computations for free convection, combined free and forced thermal convection, and free convection in more complex configurations. Some results obtained for complex configurations were given in an attempt to explain that, in the field of thermal convection in porous media, numerous problems still have to be solved. It was emphasized that, even in the classic case of natural convection in homogeneous media for a simple configuration, the solutions to some research problems have not been completely formulated. For instance, this is the case for the transition criteria between the various types of flow observed in sloping layers bounded by isothermal planes, or for possible improvements in the mathematical description of heat transfer. FINITE STATE MIXING-CELL MODELS,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
E. S. Simpson, and L. Duckstein.
Typescript, 1975. 19 p, 7 fig, 2 tab, 5 ref.

Descriptors: *Computer models, *Karst hydrology, *Simulation analysis, *Groundwater movement, *Mass transfer, Model studies, Groundwater, Synthetic hydrology, Flow, Groundwater resources, Energy transfer, Mathematical studies, Probability, Hydrogeology.
Identifiers: Finite State Mixing-Cell Models.

In this first paper of a two-part series a quasi-physical, finite-state model is developed for modeling karstic water resources in a systems framework. The model consists of a set of interconnected cells of any desired size through which the transport of water and dissolved matter is represented by a sequence of finite states governed by a set of recursive equations. Energy transport is represented by rules governing a changr of cell size from one iteration to the next. Each elementary cell may be either a pure mixing-cell or a cell that simulates partial or complete piston flow (no mixing). The proposed finite-state model responds to a real need created by the impossibility of solving the inverse problem with partial differential equations, and the lack of physical basis of black box models. In addition, the model can deal with mass transport data (many different tracers) and energy transport data (hydrograph and change in storage) and may lead to useful managerial applications such as estimates of the probability distribution function of storage volume. It is simple, flexible and inexpensive to operate, but much depends on the skill and intuition of the modeler in devising a model based on incomplete and scattered data. UNCERTAINTIES IN KARSTIC WATER RESOURCES SYSTEMS,
Arizona Univ., Tucson. Dept. of Systems and Industrial Engineering.
L. Duckstein, and E. S. Simpson.
Typescript, 1975. 17 p, 4 fig, 3 tab, 17 ref.

Descriptors: *Karst hydrology, *Groundwater movement, *Risks, *Systems analysis, *Computer models, Management, Simulation analysis, Model studies, Groundwater, Synthetic hydrology, Flow, Hydrogeology, Groundwater resources, Probability.
Identifiers: Finite State Mixing-Cell Model.

A framework to describe, analyze, an trade off uncertainties present in karstic water resources systems. Finite state model (See W76-06594) is presented to illustrate the effect of some of the physical uncertainties, particularly input upon decision making. A discrete system framework is used to establish a two-way classification of five system elements versus six types of uncertainties. Typical system elements include rainfall (input), cavity size (state), rainfall discharge relationships (state transition function), benefit-cost (output), and loss curves (output function). Uncertainty types may be natural, model, sample, economic, technological, or strategic. The finite state model is used to find how input uncertainty affects output, and a complete Bayesian analysis of input uncertainty leads to the evaluation of the value of perfect information and the worth of one more sample point. Information provided on the effect of various uncertainties make possible optimal allocation of resources, decreasing the overall uncertainty in the decision-making process. (Robinett-Arizona)

WEATHERING AND HYDROGEOLOGY OF THE BRUMUNDDAL SANDSTONE, SOUTHERN NORWAY,
Norges Landbrukshoegskole, Vollebekk. Geologisk Institutt.
J. O. Englund, and P. Jorgensen.
Nordic Hydrology, Vol. 6, No. 1, p 43-62, 1975. 10 fig, 5 tab, 20 ref.

Descriptors: *Groundwater, *Sandstones, *Hydrogeology, Europe, Wells, Montmorillonite, Porosity, Permeability, Cation exchange, Groundwater resources, Groundwater availability, *Weathering, *Water wells.
Identifiers: *Brumunddal sandstone, *Norway, Water-deposited sediments, Hematite pigment, Plagioclase, Groundwater composition.

During the last decades several wells giving yields up to 100,000 liter per hour have been drilled in the reddish Brumunddal Sandstone, which covers an area of approximately 10 sq km near lake Mjosa, Southern Norway. Most of these wells have yields below 10,000 liter per hour, and those with higher yields are situated along prominent fracture zones. Textural data strongly support the assumption of an eolian origin for this sandstone, but water-deposited sediments are found within the formation. Most of the grains are coated with a hematite pigment, which was probably epigenetically formed. Post-sedimentary but preglacial weathering processes have transformed plagioclase to montmorillonite. This has changed the porosity as well as the permeability and increased the cationic exchange capacity. A transformation of plagioclase is in agreement with the groundwater composition. (Lee-ISWS)

RAPID RECHARGE IN A LIMESTONE AQUIFER,
Birmingham Univ.,(England). Dept. of Civil Engineering.
I. A. Fox, and K. R. Rushton.
Ground Water, Vol. 14, No. 1, p 21-27, January-February 1976. 6 fig, 1 tab, 5 ref, 1 append.

Descriptors: *Groundwater, *Recharge, *Model studies, Computer models, Analog models, Infiltration rates, Soil water movement, Aquifer characteristics, Natural recharge, Mathematical models, Precipitation(Atmosphreic).
Identifiers: Limestone aquifers, Seasonal variations, Piezometric head.

The introduction of an infiltration mechanism called rapid recharge assists in the mathematical modeling of large seasonal variations in the response of the confined portion of a limestone aquifer. Such modeling employs the technique of using an interactive analogue-digital computer, together with a new method of utilizing standard hydrological input data. (Gibb-ISWS)

MELTWATER LOSSES THROUGH INFILTRATION INTO PODZOLIC SOILS AND CHERNOZEMS,
V. V. Romanov, K. K. Pavlova, and I. L. Kalyuzhnyy.
Soviet Hydrology, Selected Papers, No. 1, p 32-42, 1974. 3 fig, 5 tab, 8 ref, 1 append. Translated from Trudy Gossudarstvennogo Gidrologicheskogo Instituta, No. 214, p 106-122, 1974.

Descriptors: *Melt water, *Runoff, *Infiltration, *Soils, Podzols, Chernozems, Snow, Snowfall, Melting, Snowmelt, Forests, Forest soils, Frozen soils, Soil moisture.
Identifiers: *USSR.

Meltwater infiltration into frozen soil depends on the initial moisture and temperature of the soil and its thermophysical properties. The phase composition of water in freezing soil has the greatest effect. The phase transformations are intense in the temperature interval from 0 to -3.0 C in the loamy soils of the basins of the Don and Tosna rivers, and the content of unfrozen water changes little at temperatures from -5 to -20 C. At negative soil temperatures of about -10 to -20 C, the content of unfrozen water amounts to 10-16% in Chernozem loams and to 3-7% in Podzolic soils. The amount of unfrozen water depends on the specific surface of the soil and this relation differs for well structured and poorly structured soils. At temperatures from 0 to -10 C an impermeable layer forms in Chernozem loams and Podzolic soils at an initial moisture content equal to or greater than 0.3-0.4 of volume (50-60% of total pore volume). The volume of water lost through infiltration into frozen soils in the forest zone is apparently determined mainly by the water absorbing capacity of the soils. Therefore, the spring flood runoff coefficient in wooded drainage basins depends on the moisture deficit in the forest soils. (Sims - ISWS)

Identifiers: Trifolium-Repens.

The uptake of P and S from superphosphates in granular and powder fors by New Zealand white clover (Trifolium repens L. 'Grasslands Huia') on 2 soils and the movement of these nutrients into the drainage were studied. At the rate of fertilizers used and the range of particle sizes there were no significant differences between the powdered and granulated material in total herbage production. Similarly, there were no significant differences between ordinary superphosphate and the S-fortified materials in dry matter production. On soils with low S-retention capacity use of powdered fertilizers was likely to lead to large losses of S by leaching. For calcium sulfate fertilizers granulation greatly reduced leaching losses. Losseswith elemental S were also reduced bygranulation or by the use of coarser S. On S-deficient soils use of phosphates alone would give reduced yields, as would S alone on phosphate-deficiient soils. Use of S alone to correct S deficiency would run the risk of reduced yield in time due to insufficient P. The converse, namely the use of superphosphate, would apply on P-deficient soils, which would ultimatelybecome S deficient. Unlike S, there was no movement of P into leachates during the trial, which indicates little likelihood of P enrichment of naturl waters by this pathway.--Copyright 1975, Biological Abstracts, Inc.

Identifiers: Disturbances, *Unstable flow, Delta-function model, Wave number, Amplification, Fingering.

The stability analysis of the delta-function model of infiltration yields a maximum wave-number for unstable disturbances, Merit, and a wave-number for maximum amplification, M*. The 'column effect,' i.e. the suppression of instability in laboratory columns, depends on Mcrit; and the dimensions of fingers in unstable flows can be expected to depend on M*. When instability is induced by a sudden jump of G, the water pressure gradient behind the wetting front, Mcrit and M* may be evaluated simply and directly. When, on the other hand, instability emerges during gradual increase of G, it is necessary to study the amplification of disturbances during the whole course of increase of G through positive values. Such a study was made for one example of instability induced by air compression and for one where it was induced by increase of conductivity with depth. Both exhibited qualitatively similar patterns of amplification: disturbances of small M (wave-number) begin to be amplified sooner, but ultimately overtaken by some disturbances of larger M starting later. Definite values of M* were found, and the results discussed with special reference to fingering and to the column effect. (Visocky-ISWS)

Identifiers: Spodic horizons, *Spodosols, *Bh horizons, Pink Hill area(NC), Soluble organics, Humus accumulations.

Spodosols in North Carolina have thick, vertically continuous Bh horizons wherever the parent material is a sand or loamy sand texture that has a high water table and a downward flow of groundwater. These Bh horizons are 5-9 m thick, and their lower boundaries are always a few centimeters above a less permeable layer or a bed of green-gray sand. Pollen counts and the general morphology indicated that the thick Bh horizons are post depositional features. Percolating organics, monitored by shallow wells, move from the surface downward in quantities greater than necessary to account for the whole Bh horizon thickness. Descriptors: *Soil horizons, *Decomposing organic matter, *Chemical properties, *Physical properties, *Humic acids, *North Carolina, Atlantic Coastal Plain, Humus, Organic matter, Analytical techniques, Organic soils, Soil chemistry, Sediment transport, Chemistry, Chemical analysis, Mineralogy, *Path of pollutants.
Identifiers: *Spodic horizons, *Bh horizons, Mobile organic matter, Organic enrichment, Pink Hill area(NC), Mobile constituents, Exchangeable salts.

Thick Bh horizons in siliceous sands of the North Carolina Coastal Plain have essentially no extractable iron, and very small quantities of calcium, magnesium, and potassium. Aluminum is the dominant cation and the exchange properties of the Bh horizons are dominated by Al and organic carbon. One to two grams of total Ca, Mg, and Na/sq m per yr are being added to these soils by rainfall and recycling. From 3 to 40 g of carbon/sq m per yr is available to move into the solution below 10 cm. This is enough carbon to develop a Bh horizon 7 m thick in less than 30,000 years. The mechanism that immobilizes the carbon to form the Bh horizon is open to question. It was postulated that bases, pH changes, or other aspects of the chemical environment may have immobilized the carbon initially, but these causes have subsequently been removed or changed through leaching. Another alterna tive is organo-mineral bonding such as with silica on quartz surfaces that may be the major factor in the immobilization of carbon. (See also W76-06402) (Henley - ISWS)

A COMPARISON OF THE GREEN-AMPT AND PHILIP TWO-TERM INFILTRATION EQUATIONS,
Hawaii Univ., Honolulu. Dept. of Civil Engineering.
Y-S. Fok.
Transactions of the American Society of Agricultural Engineers, Vol. 18, No. 6, p 1073-1075, November-December 1975. 1 tab, 12 ref.

Descriptors: *Infiltration, *Equations, *Soil water movement, Darcys law, Seepage, Velocity, Hydraulic conductivity, Unsaturated flow, Percolation, Wetting, Soil surfaces, Head loss, Depth, Pore pressure, Porosity, Soil profiles, Soil moisture, Sorption.
Identifiers: *Green-Ampt equation, *Philip two-term equation.

The Green-Ampt equation is regaining popularity. The equation is a simple algebraic expression with a physical basis and utilizes parameters that can be evaluated from soil physical properties. The Philip two-term equation is also gaining popularity, because it has a theoretical basis and is adapted to fitting to observed infiltration data. The Philip two-term equation was shown to be derivable from the Green-Ampt equation, and the differences between these two equations were tabulated. The maximum difference is less than 17%. RECOVERY FROM SOIL COMPACTION ON BLUEGRASS LANGE IN THE BLACK HILLS,
Forest Service (USDA), Rapid City, S. D. Rocky Mountain Forest and Range Experiment Station.
H. K. Orr.
Transactions of the American Society of Agricultural Engineers, Vol. 18, No. 6, p 1076-1081, November-December 1975. 10 fig, 4 tab, 10 ref.

Descriptors: *Soil compaction, *Bluegrasses, *Ranges, *South Dakota, Soils, Soil mechanics, Compaction, Livestock, Climates, Overland flow, Infiltration, Percolation, Precipitation(Atmospheric), Bulk density, Vegetation, Compacted soils, Grazing, Range management, Runoff.
Identifiers: *Bluegrass range, *Black Hills(SD), Recovery, Soil core samples, Livestock grazing, Trampling, Overland runoff, Macropore volume, Fencing.

Intensive livestock grazing in bluegrass meadows and stream-bottoms in the Black Hills has resulted in compaction of the soil. Not until the second year after fencing did soils show significant increases in macropore volume. Infiltration capacities also increased and summer runoff decreased. One soil was a medium-textured silt loam and the other was a sandy loam. At a third site where soil was medium-textured but high in organic matter content and with a low bulk density, soil responses were uncertain. Infiltration increases started to appear at about the same time as improvements in soil structure. Protection from grazing and trampling resulted in less summer storm runoff in the first growing season and also in each of the following three years. After the first winter, snowmelt runoff far exceeded summer storm runoff at all three sites. Overall results clearly indicated that more than one season protection was necessary for significant soil recovery, and degree of recovery continued up to at least four years, the duration of this study. SOIL WATER POTENTIAL AND PLANT BEHAVIOR: A CASE MODELING STUDY WITH SUNFLOWERS,
Centre National de la Recherche Scientifique, Montpellier (France). Centre d'Etudes Phytosociologiques et Ecologiques.
C. H. M. Van Bavel.
Oecol Plant. 9(2), p 89-109, 1974.

Descriptors: *Soil water, Model studies, Soil-water-plant relationships, Crop response, Crops, Carbon dioxide, Energy, Behavior.
Identifiers: Potential, *Sunflowers.

A model to simulate the effect of soil water potential on the gas exchange by a plant leaf canopy is presented. The radiant energy distribution in the canopy is obtained by the Duncan method, as modified by Stewart, using leaf architecture and optics as inputs. The CO_2 and water vapor exchange for each leaf layer is found from a leaf gas and energy exchange submodel, previously described, in which the parameters of the aerial environment and the soil water potential are the inputs. The gas exchange of the entire canopy was calculated by the proposed model for a sunflower crop using the following assumed levels of soil

water potential: 0, -5, -10 and -15 bar. The calculated daily values of CO2 assimilation and transpiration were compared with actually measured values in the field. A reasonable agreement of well within 20% was obtained, and the hourly distribution also agreed with measured behavior. Detailed aspects of the model application showed that, in the sunflower crop, the soil water potential affects stomatal resistance so as to reduce both CO2 assimilation and transpiration when the soil becomes drier. A slight midday depression of the assimilation is also predicted for soil water potentials less than -5 bar. The results illustrate how environmental and plant physiological data, specifically regarding CO2 assimilation and water relations, can be combined to enable a reconstruction of the behavior of a crop-environment system under conditions of a limited water supply in the soil.--Copyright 1975, Biological Abstracts, Inc.

PORE WATER PRESSURE MEASURING DEVICE,
P. O. Jonell, and K. I. Elmgren.
U.S. Patent No. 3,935,745, 4 p, 6 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 943, No 1, p 129, February 3, 1976.

Descriptors: *Patents, *Pore water, *Pore pressure, *Water pressure, *Porous media, *Soil physical properties, Soil compaction, Measurement, Subsurface water, Instrumentation.

A pore water pressure meter of the kind used to measure the water pressure inside masses of earth or clay is described. The pore water pressure meter incorporates a pressure meter, the force or motion is dependent on the pore water pressure to be measured, and a force meter (e.g. an extensiometer) arranged to be actuated by the pressure meter. The meter incorporates a power member which is arranged to apply a force on the pressure meter of such magnitude as to override the force exerted by the meter so as to prevent the pressure meter from affecting the force meter, and to thereafter remove the force from the pressure meter and allow the latter to again transmit its force to the force meter. It is possible to read the measuring value of the pressure meter as soon as the force of the pore water pressure meter has been removed, and, after re-application of the force of the pressure meter, to read the measure value of the force meter caused by the prevailing water pressure. There is no need to pull the rod together with the pore water pressure meter out of the mass of earth in order to recalibrate it. Before forcing the pressing meter down into the mass of earth it is possible to establish various frequency curves in the neighborhood of the zero pressure frequency curve and then, after the change of the zero pressure frequency, use any one of these extra curves as a reference curve in the subsequent measuring operations. Descriptors: *Soil-water-plant relationships, *Soil moisture, *Arid lands, *Drainage engineering, *Irrigation effects, Moisture content, Fallowing, Infiltration, Groundwater, Permeability, Soil management, Soil physical properties, Zone of aeration, Alfalfa, Irrigated land, Water injury, Wheat, Agriculture, Orchards.
Identifiers: *Diyala River Basin(Iraq).

A study of soil-water relationships under different cropping patternswas carried out in the Fudhaliya Experimental Station located in the Diyala river basin, 8 km northeast of Baghdad, Iraq. The basic hydrophysical properties of the soil in the experimental area are described as well as the changes which resulted in the soil moisture regime of the unsaturated zone under different crops for the period 1969-1971. The soils are characterized by heavy texture, high water holding capacity, low permeability, low infiltration rate, and slow but steady groundwater recharge. Because of the steady recharge and lack of a drainage system, a steady rise in the water table and consequent salinization of the soil was noted. Results indicated that soil cracks play an important role in reducing the soil moisture content through evaporation, and further indicated the need for a drainage system and lining of irrigation canals. The average annual increase in the actual moisture content of the soil was 3.1 percent, 5.3 percent, and 11.2 percent in wheat, alfalfa, and orchard respectively in comparison to fallow land. The increase in the actual moisture content of the soil between August 1968 & August 1970 was 0.5 percent, 0.9 percent, 6.1 percent, and 11.5 percent in wheat, fallow, alfalfa and orchard plots respectively. Recommendations include better soil-water management using an improved irrigation system, improvement of soil structure by mulching and deep plowing, and suitable crop rotations. (Robinett-Arizona)

INVESTIGATION OF SOME PHYSICAL PROPERTIES OF THE SOILS IN THE DALMAJ PILOT PROJECT AREA,
Institute for Applied Research on Natural Resources, Baghdad (Iraq).
A. H. Al-Rawi, J. Z. Al-Rawi, H. J. Van der zel, and J. Vos.
Technical Bulletin 77, November, 1975. 45 p, 20 fig, 13 tab, 5 ref.

Descriptors: *Permeability, *Soil water movement, *Moisture content, Soil physical properties, *Irrigation effects, Infiltration, Soil analysis, Soil texture, Soil structure, Soil moisture, Field capacity, Retention, Bulk density, Soil investigations, Irrigated land, Correlation analysis.
Identifiers: *Dalmaj Pilot Project Area(Iraq).

Soil physical investigations at the Dalmaj Pilot Project Area situated in the northern part of Mazzaq Main Canal region in Iraq are described. Five experimental sites representing basin soils, silted river basin soils and irrigation levee soils were used for infiltration tests, soil moisture retention determinations and permeability measurements. Soil texture ranges from clay to loam with the total range in clay particles from 20 to 67 percent, the range in silt particles from 31 to 73 percent, and the range in sand particles from 2 to 20 percent. Average bulk density ranges from 1.4 to 1.6 g/cu cm, while permeability ranges from 50 to 110 cm/24 hours with 90 cm/24 hours as an overall average. Investigation of soil moisture showed that after irrigation the upper 30 cm of the soil profile was saturated with water, and at some sites the water did not penetrate below the 45 to 60 cm depth. Results indicated no sharp wetting front but a gradual decrease of the moisture content at each depth after irrigation. Results of the different soil physical determinations are presented in tables and graphs as are correlations between texture, available moisture and bulk density of the various soil units. (Robinett-Arizona)

CHARACTERISTICS AND CLASSIFICATION OF TWO SOILS IN DIYALA BASIN, IRAQ,
Institute for Applied Research on Natural Resources, Baghdad (Iraq).
J. S. Dougrameji.
Technical Bulletin 84, August, 1975. 20 p, 4 fig, 3 tab, 11 ref, append.

Descriptors: *Soil classification, *Soil chemical properties, *Soil physical properties, *Soil formation, *Soil-water-plant relationships, Soil horizons, Soil investigations, Soil profiles, River basins, Rivers, Alluvium, Flood plains, Deposition(Sediments), Soil texture, Calcium, Organic matter, Nitrogen, Phosphorus, Potassium, Salinity, Irrigation.
Identifiers: *Diyala Basin(Iraq).

Soil and hydrological studies were made in an area of about 125 hectares in the Diyala basin 8 kilometers northeast of Baghdad. The study revealed the presence of two distinct soil units which are representative of the Diyala-Tigris flood plain. The soils are alluvial, deposited by river and irrigation water of the Diyala and to a lesser extent Tigris rivers, and are part of a transition between high levee soils bordering the Diyala river and the heavy textured depression soils toward the west. The soils are characterized by weak to medium structure with distinct polygonal cracks, especially in the depression area. Soils are calcareous (over 19 percent lime), medium to fine textured (40-60 percent clay), low in organic matter, nitrogen and phosphorus, and medium to high in potassium. At the surface the soil is not saline, but salinity increases with depth. Without an artificial drainage system and special soil water management, the saline groundwater during flood season and under intensive cultivation constitutes a potential danger of salinization. In respect to general land use and soil irrigation capability, the two soil units are classified as class II and III for soils in the depression and high situated areas respectively. (Robinett-Arizona)

SURFACE RUNOFF AND ITS EFFECT ON DIFFUSE SALT PRODUCTION FROM MANCOS SHALE MEMBERS,
Utah State University, Logan, Dept. of Civil and Environmental Engineering.
S. L. Ponce, R. H. Hawkins, J. J. Jurinak, G. F. Gifford, and J. R. Riley.
In: Watershed Management, Proceedings, Irrigation and Drainage Division American Society of Civil Engineers, August 11-13, 1975, Logan, Utah, p. 140-168. n.d. 10 fig, 13 tab, 9 ref.

Descriptors: *Surface runoff, *Soil chemical properties, *Salinity, *Shales, *Geologic formations, Vegetation effects, Alkalinity, Water quality, Utah, Colorado River Basin, Alluvium, Soil types, Precipitation(Atmospheric), Rainfall-runoff relationships, Electrical conductance.
Identifiers: *Price River Basin(Utah).

A study was done within the Price River Basin, one of the major sources of salinity to the Colorado River, located in east-central Utah. Results indicated that alluvial deposits very near the channel of a perennial stream tend to yield runoff water of high salinity. The Blue Gate and Mancos undivided shale members are the prime salt producers in the basin. No simple relation was found between soil salinity and salinity of the runoff water over the soil. A slight correlation was noted between geologic type and the ratio of surface runoff to precipitation, while hydrologic soil-complex numbers showed no distinct separation between types. Strong linear relations exist

between electrical conductivity and Ca(++) and SO4 (r-) while poor correlations exist between the ratio of surface runoff to precipitation and surface runoff to total solids for runoff from the Mancos members. (Robinett-Arizona)

CORRELATION OF DUAL-CHANNEL AIRBORNE IR DATA WITH SOIL MOISTURE MEASUREMENTS,
Development and Resources Transportation Co., Silver Spring, Md.
L. A. LeSchack, N. K. Del Grande, S. I. Outcalt, J. Lewis , and C. Jenner.
Final Report, May 1975. 64 p, 11 fig, 11 tab, 29 ref, 4 append. Contr. 4-35308.

Descriptors: *Soils, *Soil moisture, *Soil temperature, Moisture, Temperature, *Infrared radiation, Statistics, Statistical methods, Statistical models, Regression analysis, Correlation analysis.
Identifiers: Soil radiant emittance, Soil moisture data, Infrared airborne data, Cluster analysis.

To show that a positive correlation existed among the soil-moisture-radiant emittance data, cluster analysis was used to divide the raw radiant emittance data into two distinct groups. Regression analysis thereupon showed significant positive correlations. Corrected surface temperature data were compared with calculated values obtained using a Digital Surface-Climate Simulator Model. Additionally, a 'Student Paired-t Test' showed that both observed and simulated temperature data came from the same statistical population. The implication is that the model is a useful tool for estimating the effect of soil moisture on the energy radiated from the surface. (NOAA)

SOIL MOISTURE SURVEY EXPERIMENT AT LUVERNE MINNESOTA, DATE OF SURVEY: MAY 12, 1975,
EG and G, Inc., Las Vegas, Nev.
E. L. Feimster, and A. E. Fritzsche.
Report EGG-1183-1675, November 1975. 29 p, 7 fig, 6 tab, 2 ref, 2 append. NOAA Cont. no. 31-USC-686.

Descriptors: *Surveys, *Moisture, Soil moisture, *Moisture content, Gamma rays, Remote sensing, Electromagnetic waves, Data collections, Measurements, *Minnesota.
Identifiers: *Soil moisture survey, *Gamma radiation, Terrestrial gamma flux attenuation.

Results are presented of an aerial survey employing the measurement of natural terrestrial gamma radiation carried out over farm lands south of Luverne, Minnesota on May 12, 1975. The purpose of the survey was to determine soil moisture content. During the survey, soil moisture values were computed from airborne gamma data collected over five flight lines and compared to data collected over these same lines during a similar survey of March 6, 1973. These soil moistures were compared to soil moistures computed gravimetrically from soil samples taken along flight lines during the last survey. The results indicate very good agreement between the aerial and the ground measured soil moistures. The average soil moisture values for the 8-mi long survey lines derived from these aerial measurements were in good agreement with results from ground based soil sampling. Mile-by-mile averages of the aerial data ranged from 21 to 36% for Line A with an average of 27%. This compares well to the ground based soil moisture values ranging from 23 to 29% with an average of 28%. (NOAA)

SOIL MOISTURE SURVEY EXPERIMENT AT PHOENIX, ARIZONA, DATE OF SURVEY: MARCH 18, 1975,
EG and G, Inc., Las Vegas. Nev.
E. L. Feimster, A. E. Fritzsche, and C. Jupiter.
Rpt. No. EGG-1183-1674, November 1975. 29 p, 5 fig, 6 tab, append. NOAA Contract no. 31-USC-686.

Descriptors: *Surveys, *Moisture, *Soil moisture, Moisture content, Electromagnetic waves, Gamma rays, Remote sensing, Data collections, Measurements, *Arizona.
Identifiers: *Aerial surveys, *Soil moisture survey, Gamma radiation, Terrestrial gamma flux attentuation, Phoenix(Ariz).

An aerial survey employing the measurement of natural terrestrial gamma radiation was carried out over farm lands east of Phoenix, Arizona, on March 18, 1975. The purpose of the survey was to determine soil moisture by detecting differences in the terrestrial gamma flux attentuation as a function of soil moisture content. The average soil moisture value for the 16-mile long survey line 1, derived from these aerial measurements was 21.56%. Mile-by-mile averages of the aerial data ranged from 16.6% to 32.2%. This survey was carried out in order to offer an independent method of validating soil moisture data derived from aerial microwave and infrared measurements performed by the National Aeronautics and Space Administration. CHARACTERIZING THE SOIL MOISTURE DYNAMICS OF LOESS-BRAUNSTAUGHLEY SOILS IN THE LEOSS LOAM HILLY TRACT OF NORTHWEST SAXONY, (IN GERMAN),
J. Clausnitzer.
Arch Acker-Pflanzenbau Bodenkd 19(5); p. 337-346, 1975.

Descriptors: *Soil moisture, Europe, Loam, Soils, Loess, Climates, Soil horizons.
Identifiers: *Soil depth, E. Germany.

Soil moisture variations and thus also the occurrence of wet and dry stages strongly depend on weather conditions. During the vegetation period soil moisture variations decline with soil depth. Analysis of the soil moisture suction relations revealed that Loss-Braunsaugley soils dry out almost continuously from the top to the greater depths. A specific exhaustion coefficient shows that the differences in the soil moisture dynamics of the Loss-Braunstaugley soils cannot be explained by the differences in the sequence of horizons.--Copyright 1975, Biological Abstracts, Inc.

STUDIES ON THE EFFECT OF SOIL DENSITY, TEMPERATURE AND FERTILIZATION OF THE SOIL MOISTURE, VALUE OBTAINED WITH A DIELECTRIC MEASURING TECHNIQUE, (IN GERMAN),
W. Baehn.
Arch Ackerpflanzenbau Bodenkd 19 (5); p 355-364, 1975.

Descriptors: *Soil density, *Soil temperature, *Soil moisture, Measurements, Saline soils, Salinity, Fertilization, Fertilizers, Leaching, Instrumentation.

Model experiments were carried out with 4 different soils to test the soil moisture measuring instrument (working on the basis of the dielectric constant) of Sprigade. The effect of soil density, soil temperature and soil salinity on the measured values was determined. The effect of soil density was relatively small. Big errors of measurement were due to soil temperature variations which led to changes of soil conductivity. Because of its magnitude, this error cannot be neglected or sufficiently corrected. The measured value was influenced most strongly by the continuously changing soil conductivity resulting from continuously varying ion concentrations as a result of fertilization, leaching and extration by plants as well as of varying soil moisture. The values obtained with K and N fertilizers on soils of a low exchange capacity were particularly unfavorable.--Copyright 1975, Biological Abstracts, Inc.

WATER ECONOMY OF A SOIL ON WEATHERED GRANITE UNDER A SPRUCE GROVE, (IN FRENCH),
Paris-7 Univ. (France). Lab. of Biogeography.
C. Vallee, and A. Feodorff.
Bull Assoc Fr Etude Sol 2; p 119-131, 1974.

Descriptors: Weathering, Spruce, Soils, Soil moisture, Soil water, Granite.

To determine the possible influence of deforestation on the water economy of the Morvan granitic soils, 2 neighboring sites, one under spruces and the other within a recent cutting were submitted to periodic humidity measurements and continuous soil moisture stress recording at 2 levels for 2 yr. Differences were observed in the consumption of the soil water reserve of the 2 sites. It was much lower under the cutting than under the spruce grove.--Copyright 1975, Biological Abstracts, Inc.

A NATURAL HISTORY STUDY OF THE VASCULAR FLORA OF CEDAR BOG, CHAMPAIGN COUNTS, OHIO,
Urbana Coll., Ohio. Div. of Scientific Mathematics.
C. M. Frederick.
Ohio J Sci. 74(2), p65-116, 1974.

Descriptors: *Bogs, Vegetation, Ohio, Trees, Climates, Weather, Swamps, Distribution, Temperature.
Identifiers: Mad River(Ohio), Cedar bog.

Cedar Bog Nature Preserve is a relict boreal bog situated in the Mad River valley in Champaign County, west-central Ohio. Originating following the retreat of the Wisconsin glacier, it has been maintained by the combination of a usually cool moist microclimate and a uniform flow of cool ground water. Microclimatic data recorded from 1963 through 1969 demonstrate that Cedar Bog has cooler temperatures and a shorter frost-free period than do adjoining areas. These 2 factors have resulted in the survival of plants unique to this part of Ohio. Within the Bog area, 6 major plant associations have been identified-the bog meadow, marl meadow, arbor vitae, swamp forest, hardwood forest and shrub associations. The marl meadow (the wettest area) lies in the northeast section, with the bog meadow and arbor vitae associations south of it, the swamp forest occurring adjacent to the arbor vitae, on the west and the hardwood forest lying beyond the swamp forest. A total of 546 taxa of vascular plants was identified in the Bog; this list is presented, together with information on occurrence, abundance, and whether or not the species has been reported earlier. Of these taxa, 173 were previously unreported for Cedar Bog, whereas twenty-one with earlier documented occurrences are now apparently extinct in the Bog. --Copyright 1975, Biological Abstracts, Inc.

VEGETATION CHANGES IN A SMALL MICHIGAN BOG FROM 1917 TO 1972,
Wisconsin Univ., Green Bay. Coll. of Environmental Sciences.
C. R. Schwintzer, and G. Williams.
Am Midl Nat. 92(2), p 447-459, 1974.

Descriptors: *Bogs, *Vegetation, Trees, Weather, Climates, Flooding, Michigan, Mortality.
Identifiers: Chamaedaphne, Bryants bog(Mich).

Quantitative descriptions of the vegetation and maps of the pool of Bryant's Bog are available for several years since 1917. The vegetation advanced into the bog pool in an irregular manner at an average rate of 2.1 cm/yr. In 1972 the pool was 76% of its extent in 1926. The vegetation changed in a successional series from the Chamaedaphne association of 1917 to the high bog-shrub association in the dry years of the 1920's to a bog forest which was well established in the late 1960's. It regressed in the early 1970's when many of the trees died and the Chamaedaphne association appeared to be re-establishing itself. The most probable cause of tree mortality was flooding caused by exceptionally high water levels due to natural weather cycles. Tree mortality was also found in Hoop Lake Bog-which, like Bryant's Bog, lacks aboveground drainage-while none occurred in bogs with above ground drainage.--Copyright 1975, Biological Abstracts, Inc.

HORIZONTAL DISTRIBUTION OF ZOOPLANKTON IN THE MINGECHAUR RESERVOIR, (IN RUSSIAN),
I. A. Akhmedov.
Izv Akad Nauk Az SSR ser Biol Nauk 5-6, p 106-111, 1974.

Descriptors: Zooplankton, Reservoirs, Distribution patterns, Spatial distribution, Algae, Fish.
Identifiers: Azerbaijan-SSR, *USSR(Mingechaur Reservoir).

Investigations in 1965-1970 established that a number of species of zooplankton have a wide horizontal distribution in the Mingechaur Reservoir on the Kura River in the Azerbaidzhan SSR (USSR). In the upper stretch of the reservoir 26 spp. were found; in the middle stretch, 29 spp.; in the lower stretch, 25 spp.; and in the Khanabad stretch near the dam, 15 spp. The seasonal distribution of zooplankton in the reservoir has 2 phases: winter and spring, with maximum biomass in the middle stretch and the minimum in the lower and Khanabad stretches, and summer and fall, with maximum development in the upper stretch. The nonuniform distribution of zooplankton in the reservoir depends on the water level, transparency, thermal regime, wind direction, current velocity, development of algae and consumption of zooplankton by fish.--Copyright 1975, Biological Abstracts, Inc.

Identifiers: Elodea-Canadensis, Macrophyte, Nuphar-Luteum, Phragmites-communis, Potamogeton-Natans, Scirpus-Lacustris, *Sweden(Lake Tamnaren).

Lake Tamnaren, a shallow lake with an average depth of 0.9 m and a maximum depth of 1.8 m, is situated about 65 km NNW of Uppsala central Sweden. The area of the lake is 38 km2, of which L. Sorsjon, and almost separated bay, occupies 3 km2. The surface of L. Tamnaren was lowered in 1875 and 1950, resulting in a level 1.5 m below the original. This has caused a vigorous growth of the vegetation. Aerial photography of the lake was carried out in the summer of 1973 and mapping done with the help of the pictures. Each stand of vegetation was dominated by a single species. Phragmites communis Trin, and Scirpus lacustris L. were the most common species along the shores. Towards the middle of the lake these stands were succeded by a belt of floating-leaved vegetation with Nuphar luteum (L.) Sm. and Potamogeton natans L. The distribution areas of the plants were measured using a photoelectric method. The total area of the aquatic macrovegetation is 30.7 km2, which means that all of L. Sorsjon and 79% of L. Tamnaren were covered with vegetation. It was not possible to record sparsely scattered plants and submerged vegetation. In some parts Elodea canadesis Michx. was very abundant.

2I. Water In Plants

THE ORIGIN AND DEVELOPMENT OF WATERLOGGED MEADOWS IN THE CENTRAL PART OF THE SUMAVA FOOTHILLS,
Ceskoslovenska Akademie Ved, Brno. Botanicka Ustav.
K. Rybnicek, and E. Rybnickova.
Folia Geobot Phytotaxon. 9(1): 45-70. 1974.

Descriptors: *Europe, Lakes, Sediments, *Grasslands, Biological communities, Ecology, Plant populations, Profiles, Distribution patterns.
Identifiers: Czechoslovakia, Foothills, Lake Holocene, Meadows, Lake Flandrian, Sumava.

The paleoecological investigation of the meadows (Czechoslovakia) is based on the macroscopic analyses, completed with pollen analyses, of Late Holocene (Lake Flandrian) sediments in 5 profiles. It is suggested that, in the course of the last 600-700 yr, the meadows developed as a secondary plant community, replacing original alder stands, due to the activity of man in the area; they usually passed through seminatural meadow types to the present cultivated stands. In addition to detailed descriptions of local successions on various sites, the study presents some general conclusions concerning the cenotic and synecological adaptability of some plants, discusses the development of plant communities and their changes in time.--Copyright 1974, Biological Abstracts, Inc.

THE DISTRIBUTIONAL ECOLOGY AND DIVERSITY OF BENTHIC INSECTS IN CEMENT CREEK, COLORADO,
Maryland Univ., College Park. Md. Dept. of Zoology.
J. D. Allan.
Ecology, Vol. 56, No. 5, p 1040-1053, Late Summer, 1975. 9 fig, 8 tab, 54 ref.

Descriptors: *Ecological distribution, *Spatial distribution, Benthic fauna, Streams, *Ecotypes, *Aquatic insects, Ecology, Biological communities, Predation, Water temperature, Biota, Environmental gradient, *Colorado, Elevation.
Identifiers: *Cement Creek(Colo), Diversity, *Benthic insects.

Streams exhibit longitudinal zonation in such factors as temperature, current, substratum, and biota. Several levels of spatial scale were studied in the alpine stream Cement Creek in Gunnison County, Colorado. Faunal replacement did not appear to be affected by ecotones including zonation in terrestrial vegetation and trout distribution, but did seem to be associated with gradual changes in the physical gradient. Trout zonation may affect total number of insects, as the trout-free headwaters had two to six times higher insect densities. Investigation of microdistribution led to the hypothesis that increased substratum complexity leads to greater species richness based on several lines of evidence: (1) different species showed different substratum preferences, (2) colonization of mixed substrata generally resulted in greater mean species richness than did colonization of a single substratum type, and (3) both species diversity and substratum complexity were greatest at the within-microhabitat level. Substratum composition showed little variation along the elevational gradient and did not appear to be a cause of faunal replacement. (Robinett-Arizona)

INLAND WATERS, SPECIFIC PRESENTATIONS FROM LIMNOLOGY AND RELATED FIELDS, VOL. 27. THE REED PHRAGMITES COMMUNIS TRINIUS, (IN GERMAN),
L. Rodewald-Rudescu.
302 p. E. Schweizerbart'sche Verlagsbuchhandlung: Stuttgart, West Germany. 1974.

Descriptors: *Reeds, *Inland waterways, imnology, Systematics, History, Plant physiology, Publications, Distribution, Drought, Aquatic plants, Microorganisms.
Identifiers: *Phragmites-Communis.

The general systematics, distribution, history, morphology and macro- and micro- scopic anatomy of reeds are discussed. Development, reproduction, O2 supply, water and material balance and resistance to cold, drought and salt are also covered. Then climate, soil and water microbiology and chemistry, flora and fauna of Phragmites crops, chemical properties with respect to paper production and classification according to biotype are discussed. Finally, methods of reed cultivation, nutrient solutions, morphological, anatomical and physiological changes due to cultivation, mechanical harvesting, storage, damage and the broad significance of reeds in industry are examined. --Copyright 1975, Biological Abstracts, Inc.

THE 'RHEINSCHNAKEN' (DIPTERA, CULICIDAE) SPECIES, LIFE STYLE, ECOLOGY, MASS DEVELOPMENT, AND CONTROL, (IN GERMAN),
Freie Universitaet Berlin (West Germany). Institut fuer Angewandte Zoologie.
F. Peus.
Z Ange W Zool 62 (2), p 231-242, 1975.

Descriptors: Diptera, Europe, Ecology, Rivers, Forests, *Mosquitoes, Regions.
Identifiers: Aedes-sticticus, Aedes-vexans, *Culicidae, Rheinschnaken, *Rhine River(W Germany).

The regional expression 'Rheinschnaken' refers to the Aedes vexans and A. sticticus which occasionally occur in large numbers in the lowland forests along the upper Rhine river (West Germany). The large stagnant pools of water formed by stopping off older sections of the river and those formed in the natural basins in the forests are the main breeding areas. The annual cycle of these mosquitoes corresponds closely to the hydrological events in the lowland forests. Floods in spring and midsummer produce 2 generations. The higher the ground water level, the greater the

number of eggs developed. The older sections of the river should be re-integrated into the main stream and the forest basins should also be connected with the river via canals. These measures are preferable to chemical control since no immunity develops and there is no further pollution. The use of repellents is recommended for anyone staying in the area. Large swarms of harmless Chironomidae are often mistaken for mosquitoes by laymen and light traps are somewhat successfully used against them but these are mostly ignored by the mosquitoes.--Copyright 1975, Biological Abstracts, Inc.

EFFECTS OF SOIL MOISTURE ON GROWTH OF JAPANESE RABDOSIA, (IN JAPANESE),
N. Kurosaki.
Acta Phytotaxon Geobot 26(3/4), p 89-95, 1974.

Descriptors: *Soil moisture, *Growth rates, Growth stages.
Identifiers: *Rabdosia, Rabdosia-effusa, Rabdosia-inflexa, Rabdosia-janponica, Rabdosia-longituba, Rabdosia-shikokiana, Rabdosia-trichocarpa, Rabdosia-umbrosa, *Japan.

Seven species of Rabdosia (R. effusa, R. inflexa, R. japonica, R. longituba, R. shikokiana, R. trichocarpa, R. umbrosa) were studied. Growth was measured by shoot length, number of nodes/and leaf size for each cultivation of 53-55 days after the germination. For every species except R. japonica, response was similar. The optimum soil moistures were 60% and 80% of maximum water capacity. When cultivated with 40% and 100% water supply, growth was distinctly reduced, and on media with 20% water supply the plants became stunted or often died. In R. japonica, the range of optimum soil moisture was 40%-80%. On the media with 20% and 100% water growth was poor. Compared with the vicarious varieties restricted to the Pacific Ocean side, those of Japan Sea elements, R. shikokiana var. occidentalis and R. umbrosa var. hakusanensis, tended to have maximum growth on media somewhat higher in soil moisture (80%).--Copyright 1975, Biological Abstracts, Inc.

OPTIMAL DISTRIBUTION OF ASSIMILATES DURING LIMITED WATER SUPPLY: A MATHEMATICAL MODE, (IN RUSSIAN),
Akademiya Nauk Estonskoi SSR, Tartu. Institut Fiziki i Astronomii.
K. Moldau.
Eesti Nsv Tead Akad Biol 24(1); p 3-9, 1975.

Descriptors: *Water supply, *Mathematical models, Optimization, *Distribution patterns, Roots, Leaves, *Growth rates, *Reproduction.

For every soil and atmospheric humidity value there exists an optimal distribution of assimilates between roots and leaves which ensures the maximum rate of assimilation in leaves. With a constant growing period and constant water deficit the maximum reproductive yield is guaranteed by sharp transition from vegetative to reproductive growth in an optimal time. Under water stress the optimal length of the reproductive growth period is increased. At maximum reproductive yield the ratio of reproductive mass to the whole biomass of plant is 0.5, irrespective of water deficit and length of the growing period. The model allows some phenomena of plant adaption of water deficits to be demonstrated.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: *Respiration, *Plant physiology, *Metabolism, Equations, *Carbon dioxide production, Temperature, Equations.

Analytic treatment of basic plant catabolism ($RCOOH + 02 = CO2 + H2O = 2$) is presented providing equations describing the dynamics of CO2 production in respect to temperature and correlating CO2 production with the dynamics of water accumulation and transpiration in plant cells to the limit of plant death. The final equation derived suggests that temperature fluctuations within ordinarily encountered limits determine the duration of plant vegetation.--Copyright 1975, Biological Abstracts, Inc.

EFFECTS OF ANTITRANSPIRANTS ON DISTRIBUTION AND UTILIZATION OF PHOTOSYNTHATE IN PINUS RESINOSA SEEDLINGS,
Ibadan Univ. (Nigeria). Dept. of Botany.
M. O. Olofinboba, T. T. Kozlowski, and P. E. Marshall.
Plant Soil. 40(3), p 619-635, 1974.

Descriptors: *Antitranspirants, *Distribution patterns, *Pine trees, *Seedlings, Sprays.
Identifiers: Carbon-14, Folicote, Keykote, *Photosynthate.

Three-year-old P. resinosa Ait. seedlings were exposed to C14O2 24 h after application of Aqua Gro, CS 6432, or Wilt Pruf antitranspirants; more activity was recovered from treated seedlings than from control seedlings 1 day after exposure to C14O2. However, less activity was recovered when seedlings were exposed to C14O2 11 days after treatment with any antitranspirant except Clear Spray. Clear Spray, Folicote and Keykote reduced accumulation of photosynthate, but their effects diminished with time. They also reduced the rate of loss of currently produced photosynthate, with the utilization effect most pronounced in Folicote-treated seedlings. All antitranspirants tested, except Aqua Gro and CS 6432, initially reduced the rate of conversion of labelled photosynthates into ethanol-insoluble components when treated seedlings were exposed to C14O2 24 h after antitranspirant application. More labelled ethanol-insoluble components were recovered from antitranspirant-treated seedlings than from controls 14 days after exposure of seedlings to C14O2. The type of spray, time between antitranspirant application and exposure to C14O2, as well as the time between exposure and seedling harvest, has significant effects on C14 assimilation and redistribution of soluble and insoluble assimilates in various plant parts. Many of the observed effects may not have been directly due to the antitranspirants alone but may have been secondary effects caused by antitranspirant-induced changes in photosynthesis and plant water balance.--Copyright 1974, Biological Abstracts, Inc.

INFLUENCE OF WATER STRESS AND GROWTH REGULATOR APPLICATIONS ON SUGAR COMPOSITION OF SOYBEAN LEAVES,
Arkansas Univ., Fayetteville. Dept. of Agronomy.
J. T. Cothren, and C. A. Stutte.
Phyton Rev Int Bot Exp. 31(2), p137-143, 1973.

Descriptors: Soybeans, Leaves, Plant physiology, Chromatography, Growth rates, Fertilizers, Crop production.
Identifiers: Chromatography, Fructose, Glucose, Hydrofurfuryl, Phosphonium, Sucrose, Sugar.

Sugars extracted from soybean leaves treated with either tributyl (5-chloro-2 thienyl) phosphonium chloride or tetrahydrofurfuryl isothiocyanate were assayed for total sugar concentration and composition. Total sugars were estimated colorimetrically while glucose, fructose, and sucrose were determined by gas and thin layer chromatography. Chemical treatments under controlled environmental conditions resulted in a decreased relative percentage composition of glucose and frucose and an increase in sucrose. The total sugar concentration in the leaves of field grown 'Davis' soybeans decreased with tetrahydrofurfuryl isothiocyanate treatment. As with the environmentally controlled plants, the relative percentage of glucose and fructose decreased with sucrose increased. This increased relative percentage of sucrose paralleled seed yield increases of 20% in water stressed plants and 15% in the non-water stressed plants when they were chemically treated. There was 118% seed yield increase in 'Davis' soybeans which were irrigated and chemically treated as compared to water stressed, nontreated plants. --Copyright 1974, Biological Abstracts, Inc.

2J. Erosion and Sedimentation

FORMATION OF WATER AND SEDIMENT DISCHARGE DURING THE SPRING FLOOD ON A SLOPE AND IN A SMALL GULLY-RAVINE DRAINAGE BASIN,
N. I. Drozd, Z. A. Goretskaya, and P. A. Shkryabiy.
Soviet Hydrology Selected Papers, No. 3, p 154-160, 1974. 2 fig, 3 tab. Translated from Transactions of the State Hydrologic Institute (Trudy Gossudarstvennogo Gidrologicheskogo Instituta), No. 210, p 31-39, 1974.

Descriptors: *Runoff, *Erosion, *Sediments, *Snowmelt, Ravines, Gullies, Melt water, Suspended solids, Discharge(Water), Discharge measurement, Snow, Spring, Precipitation(Atmospheric), Sediment discharge, Basins, Watersheds(Basins).
Identifiers: *USSR, *Dnieper River(USSR).

Water erosion produced by meltwater runoff from slopes and small drainage basins of the gully-ravine type is severe in the hills on the right bank of the Dnieper River. Spring runoff is variable and even discontinuous in the course of the day and in individual periods of snow melting. Peak discharges are relatively low, but of considerable volume, frequently exceeding that of flood runoff by many factors. The variations and characteristics of runoff from two elementary drainage basins during the spring flood of 1969 were examined. Water runoff was measured by weirs at the outlet gaging stations of the ravines. The water was sampled for its suspended particle concentra-

tion from two to six times a day, mainly in the afternoon. Precipitation, snow depth, the water equivalent of snow, soil freezing, and soil moisture to a depth of 1.0-1.5 m were measured in the drainage basins. The values of the liquid and solid components of runoff varied throughout the spring not only from day to day, but also in the course of the day. The highest hourly runoff was observed in the afternoon, from 12-13 to 17-18 h. The irregularity of meltwater runoff and of sediment discharge in the course of a spring must be taken into account in computing the volume and filtration capacity of earthen erosion control structures. (Sims-ISWS)

SEDIMENT RESERVOIRS IN THE CHANNELS OF SMALL MOUNTAIN RIVERS,
K. F. Artamonov, A. N. Kroshkin, and N. N. Bystrov.
Soviet Hydrology, Selected Papers, No. 3, p 210-213, 1974. 2 fig, 1 tab, 4 ref. Translated from (Hydraulic Engineering and Reclamation), Gidrotekhnika i melioratsiya, No. 6, p 34-37, 1974.

Descriptors: *Sediments, *Suspended solids, *Rivers, Erosion, Sedimentation, Bed load, River beds, Channels, Mountains, Discharge(Water), Sediment discharge.
Identifiers: *Sediment reservoirs.

Sediment reservoirs on small mountain rivers are an effective means for retaining bed-load and partly of suspended load under high sediment discharge conditions. A complex method of computing the silting of the headrace with separate consideration of the formation of the cones of bed- and suspended-load deposits in the zone of the backwater curve is best suited for computing sediment reservoirs in the mountainous reaches of rivers with a bedload discharge of more than 20-30% of total annual solid discharge. In addition to the organization of quarries of construction material in the headrace, an important measure for increasing the service time of a sediment reservoir (in the presence of outlet discharges and the possibility of completely lowering the water level) is washing of the sediment deposits. The effectiveness of washing increases when bed load is retained in small and the suspended load in large sediment reservoirs. To prevent general and local deformations in the trailrace, the threshold of the outlet opening must be raised above the average level of the river flood plain, the foundations of the cut-off wall must be deepened, and the outlet channel must be regulated. OPTIMUM DREDGED DEPTH IN INLAND WATERWAY,
CACI, Inc., Arlington, Va.
A. B. Hochstein.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 101, No. WW4, Proceedings Paper 11698, p 331-342, November 1975. 4 fig, 2 tab, 4 ref, 2 append.

Descriptors: *Barges, *Channels, *Dredging, Hydrology, Optimization, Open channel flow, Transportation, *Inland waterways, Networks, Rivers, Water levels, Locks, River beds, Economics.
Identifiers: *Channel stabilization, *Waterways, Economic analysis, Tow industry, Optimal channel depth, Economic estimates.

Criteria for optimum depths in the inland waterway network is minimized value of the sum: cost of tow industry plus cost of waterway structures, in the open rivers mainly cost of dredging. Volume of dredging is estimated by use of the relationship between the most important hydrological and morphological parameters that determine the degree of stability of the riverbed. If extensive dredging is planned, it is necessary to take into account change of hydraulic parameters of the river that will be followed by a lowering of the water level and depths in channels. In the reaches of open river with sufficient large seasonal oscillation of water levels, it is important to calculate the average usable (seasonal or annual) depth and draft on the base of the relationships between water level and controlling depth. The plan described represented a simple solution to the problem of optimal channel depth, useful for planning purposes and economic estimates. (Roberts - ISWS)

DEPOSITIONAL MODELS AND THE SHINARUMP MEMBER AND THE SONSELA SANDSTONE BED OF THE CHINLE FORMATION NORTHEASTERN ARIZONA AND NORTHWESTERN NEW MEXICO,
Arizona Univ., Tucson. Dept. of Geosciences.
A. S. Trevena.
Master of Science Thesis, 1975, 162 p, 43 fig, 12 tab, 74 ref, 4 append.

Descriptors: *Streambeds, *Geomorphology, *Deposition(Sediments), *Model studies, *Geologic formations, Geology, Streams, Sedimentation, Braiding, Graded, Arizona, New Mexico, Beds(Stratigraphic), Fluvial sediments, Rivers, Sediments, Sandstones, Paleohydrology, History.
Identifiers: *Chinle Formation(Ariz - N Mex).

Modern stream deposits are the key to recognizing the distribution of ancient fluvial environments for a better understanding of paleogeography and paleotechtonics. Studies in north eastern Arizona and northwestern New Mexico confirm a stream channel origin for the Shinarump Member and the Sonsela Sandstone Bed of the Chinle Formation and show that streams of diverse channel patterns were present in this region during the Late Triassic. In this paper, three stream channel models are developed from published reports of present-day fluvial sedimentation: (1) abundant horizontally stratified and/or structureless coarse sandstone to conglomerate indicate a bed-load, braided stream model; (2) trough cross-stratified sandstone that becomes finer-grained upward characterizes the suspended-load meandering stream model; and (3) streams of intermediate channel pattern are typified by abundant tabular-planar cross-stratification, trough cross-stratification, and horizontal stratification. This study also indicates that reports of present day fluvial deposits and controlled laboratory flume studies can be used to interpret flow conditions of ancient streams. (Robinett-Arizona)

INITIATION OF BED FORMS AND MEANDERS IN COARSE-GRAINED SEDIMENT,
University Coll. of Wales, Aberystwyth. Dept. of Geography.
Geological Society of America Bulletin, Vol. 87, No. 2, p 281-285, February 1976. 6 fig, 1 tab, 24 ref.

Descriptors: *Meanders, *Fluvial sediments, *Channel erosion, River training, *Geomorphology, Streambeds, Sediment transport, On-site investigations, Hydraulics, Flow rates, Bank erosion.
Identifiers: *Bed forms, *River Ystwyth(Wales), Pseudo-meandering model.

Some field observations pertinent to the role of point-bar formation in meander development were reported. Observations were carried out on the River Ystwyth in Wales. Part of the river was artificially straightened in 1864 and restraightened in 1969. The field observations showed that in a straight plane-bed channel in coarse sediment under natural flow conditions, primary transverse bars were rapidly formed during infrequent high flows, and the accompanying flow modifications led to bank erosion. Primary bars were subsequently incorporated as the cores of point-bar complexes, with additional lateral and tail accretion, chute formation, and lesser erosional and sedimentary modifications. The range of natural flows produced a variety of bed forms; therefore, the channel form at any point in time was not strictly attributable to any single controlling discharge, but the broad features of channel development in general relate to the forms of the pseudo-meandering model. A three-phase model of meander development, with these observations exemplifying the first phase, is adequate and useful. (Singh - ISWS)

LOESS IN OHIO IN RELATION TO SEVERAL POSSIBLE SOURCE AREAS: I. PHYSICAL AND CHEMICAL PROPERTIES,
Ohio State Univ., Columbus. Dept. of Agronomy.
E. M. Rutledge, N. Holowaychuk, G. F. Hall, and L. P. Wilding.
Soil Science Society of America Proceeding, Vol. 39, No. 6, p 1125-1132, November-December 1975. 5 fig, 3 tab, 25 ref.

Descriptors: *Loess, *Ohio, *Valleys, Geomorphology, *Chemical properties, *Physical property, Particle size, Soil formation, Paleosols, Age, On-site investigations, Chemical analysis, Distance, Soil profiles, Silts, Clays, Soil horizons.
Identifiers: Source areas, *Little Miami River(Ohio), *Scioto River(Ohio), *Muskingum River(Ohio), Peoria loess, Roxanna silt, Loveland silt, Sangamon paleosol, Multiple deposits, Fine earth criterion, Clay-free criterion, Pedogenic data, Alfisols.

Thin loess deposits east of the Little Miami, Scioto, and Muskingum rivers in Ohio were in-

vestigated (1) to test the hypothesis that these river valleys were source areas for the loess that adjoins them, (2) to determine if multiple loess strata occurred within any of the loess deposits, and (3) to approximate, where possible, the geologic age of the loess. The loessial materials were investigated using morphological, chemical, and physical parameters. Particle-size data were expressed on a fine earth and clay-free basis. The fine earth basis was useful in detecting pedogenic development. Clay-free data were used in establishing changes in parent material with depth and, perhaps more importantly, in development of relations between particle-size and distance from proposed source areas. Scioto and Muskingum river valleys were the chief source areas for the loess in the adjoining study areas, but the Little Miami Valley was not the primary source of the loess in the study area adjacent to it. Multiple loess deposits were identified only adjacent to the Muskingum River. All upper loess units were considered to be of comparable age: Late Wisconsin (Peoria Loess). The middle loess adjacent to the Muskingum River was considered to be Farmdale (Roxanna Silt) and the lower loess at the same site was considered to be Loveland loess (Loveland Silt) and contained a well-developed Sangamon paleosol. (See also W76-06400) (Visocky-ISWS)

LOESS IN OHIO IN RELATION TO SEVERAL POSSIBLE SOURCE AREAS: II. ELEMENTAL AND MINERALOGICAL COMPOSITION,
Ohio State Univ., Columbus, Dept. of Agronomy.
E. M. Rutledge, L. P. Wilding, G. F. Hall, and N. Holowaychuk.
Soil Science Society of America Proceedings, Vol. 39, No. 6, p 1133-1139, November-December 1975. 2 fig, 1 tab, 11 ref.

Descriptors: *Loess, *Ohio, *Mineralogy, *Weathering, Soil horizons, Clays, Silts, Soil formation, Particle size, Clay minerals, Calcium, Iron, Potassium, Titanium, Soil profiles, Depth, Paleosols, Quartz, Kaolinite, On-site investigations, Chemical analysis.
Identifiers: *Clay fractions, *Muskingum River(Ohio), *Little Miami River(Ohio), *Scioto River(Ohio), Mica, Vermiculite, Zirconium.

This study presents the elemental and mineralogical composition of thin loessial deposits eastward of three rivers in Ohio. In general, elemental contents (Ca, Fe, K, Ti, and Zr) of medium and coarse silts of the Late Wisconsin-age loesses were of the same magnitude in each area. These elements show remarkably slight weathering profiles which were essentially comparable among areas. Weathering profiles of Fe were more strongly expressed than those of K and Ca depth-distribution of Zr and Ti were most uniform. Contents of Ca within a Loveland loess paleosol were remarkable constant in depth and notably low, especially in the coarse silt fraction (mean of 0.06%). Mineralogy did not reflect bedrock lithologies among the different assumed loess areas. Clay fractions from the parent loess in the first two transects were dominated by mica followed by vermiculite and quartz with less expandable and kaolinite. Clay fractions of surface and subsurface horizons in these transects contained about equal amounts of mica, vermiculite, and quartz with less expandables and kaolinite. In the third transect, weathered loessial materials generally contained less mica and more interstratified 10-14 angstrom componens. Clay-free particle-size distribution was the most sensitive parameter of parent material uniformity; total Zr and Ti in silt fractions, and Ti/Zr ratios were less sensitive in that order. EROSION AND SEDIMENT TRANSPORT IN THE OWENS RIVER NEAR BISHOP, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
R. P. Williams.
Available from National Technical Information Service, Springfield, Va 22161 as PB-251 109/As, $4.50 in paper copy, $2.25 in microfiche. Water-Resources Investigations 49-75, December 1975. 49 p, 22 fig, 9 tab, 26 ref.

Descriptors: *Bank erosion, *Sediment transport, *Erosion rates, *Reservoir releases, *Fisheries, *California, Ecosystems, Brown trout, Sediments, Particle size, Streams, Streamflow, Bed load, Channel erosion, Channel morphology, Data collections, Evaluation, Postimpoundment.
Identifiers: *Owens River(Calif), Pleasant Valley Dam(Calif).

The Owens River near Bishop supports one of the outstanding brown trout fisheries in California. The brown trout prefer to spawn in gravel approximately 0.75 in in diameter. Closure of Pleasant Valley Dam in 1954 has almost eliminated the supply of gravel to the 16-mile study reach of the Owens River. Because of armoring of the channel, scour has been limited to approximately 1 foot in the upper 2.3 miles. Information in this report should be useful in determining long-term erosion effects below Pleasant Valley Dam, in assessing the feasibility of a proposed bypass channel versus retention of the main channel in its present state, and in determining man's influence on river morphology. Bank erosion is accelerated by wide ranges in flow release. Average annual bank-erosion rates were 750 tons from 1947 to 1967, 1,970 tons from 1967 to 1968, and 2,020 tons from 1968 to 1971. Hydraulic geometry at six sites indicates a shift in the river system regime since 1954. These changes have progressed downstream from the dam to a point between sites 4 and 5. Farther downstream channel changes will occur until the channel stabilizes. (Woodard-USGS)

THE BED-LOAD FUNCTION,
Research Council of Alberta, Edmonton. Highway and River Engineering Div.
S. Beltaos.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol. 102, No. HY1, p 131-136, January 1976. 2 fig, 8 ref.

Descriptors: *Bed load, *Sediment transport, Sedimentation, Rivers, *River beds, *Sediment load, Sedimentation rates, Hydraulics, Turbulent flow, Stochastic processes.
Identifiers: *Bed-load function, *Detached particles, Einstein bed-load function, Mean jump length.

A simple derivation of the bed-load function was presented. It was shown that the jump length of detached particles need not be assumed constant, and by treating it as a random variable, that it is only its mean value that influences the rate of transport regardless of what its probability density function may be. The present approach is considerably simpler than Einstein's in that it does not need to consider multiple jumps and their probabilities. Further, a simple empirical equation for the probability of detachment was developed, which could be helpful when dealing with applications of the bed-load function. (Lee-ISWS)

THE TECHNIQUE OF REMOVING LARGE UNDISTURBED SAMPLES OF LAKE SEDIMENT: AN IMPROVED BORE PLUMB, (IN GERMAN),
H. Ambuehl, and H. Buehrer.
Shweiz z Hydrol 37(1), p 175-186, 1975.

Descriptors: *Lake sediments, *Sampling, Analytical techniques, Lakes.

A new sampling device for the extraction of completely undisturbed samples from the lake sediments is described. The core has a diameter of 110 mm and a length of 60 cm or more. Technical prerequisites include a sampling tube without interfering structure and with a very sharp end. The valve (to retain the sample) is designed so that water can flow out of the tube when the device is thrust into the sediment but is absolutely tight after sampling. If the sediment is compact (clay-like) sampling can be carried out without closing the tube at the base. There is an automatic closing mechanism for material with a high water content and an apparatus for subsequent preparation of the sample.

HOT SPRINGS OF RHODESIA: THEIR NOBLE GASES, ISOTOPIC AND CHEMICAL COMPOSITION,
University of the Witwatersrand, Johannesburg (South Africa). Nuclear Physics Research Unit.
E. Mazor, and B. Th. Verhagen.
Journal of Hydrology, Vol. 28, No. 1, p 29-43, January 1976. 6 fig, 3 tab, 11 ref.

Descriptors: *Hot springs, *Gases, *Thermal springs, *Chemical analysis, *Isotope studies, Analytical techniques, Mass spectrometry, Springs, Water types, Spring waters, Argon, Helium, Confined water, Hydrogen, Oxygen, Radioisotopes, Radio-chemical analysis, Chemistry, Instrumentation, Meteoric water, Hydrologic cycle, Ions.
Identifiers: *Noble gases, Isotopic composition, Chemical composition, *Rhodesia, Meteoric origin, Dissolved ions, Noble gas contents.

Four of Rhodesia's hottest spring complexes (54-100 C) were studied. Tritium contents were very low compared to adjacent rivers, indicating that the samples studied were indigenous, deep-seated water which had undergone negligible intermixing with surface water. The noble-gas measurements revealed: (1) the waters are meteoric; (2) the noble gases were kept in closed-system conditions in the ground; (3) paleotemperatures are 26-31 C; and (4) the boiling Binga springs lost part of their noble gases. Independently, measurements of stable isotopes indicated the meteoric origin of the springs. The chemical composition of the waters clearly reflected their origin from two groups of rocks - one from Karroo sediments and one from crystalline rocks. (Henley-ISWS)

V. V. Palciauskas, and P. A. Domenico.
Geological Society of America Bulletin, Vol. 87, No. 2, p 207-214, February 1976. 7 fig, 20 ref.

Descriptors: *Carbonate rocks, *Water chemistry, *Mass transfer, *Equilibrium, *Florida, Sedimentary rocks, Aqueous solutions, Dispersion, Convection, Chemical reactions, Saturation, Velocity, Groundwater movement, Geochemistry, Hydrogeology, Equations, Interfaces, Porous media, Kinetics, Temperature, Pressure, Calcite, Ion transport, Mathematical models.
Identifiers: *Floridan aquifer, Concentration gradients.

The physical and chemical processes that tend to promote an approach to equilibrium between an aqueous solution and one or more minerals in a carbonate system include dispersion, convection, and chemical reactions. When the spatial dependence of ionic constituents was examined from the point of view of these processes, the results showed that the distance to attainment of saturation with respect to an individual mineral increases with increasing rates of dispersion and velocity of groundwater and decreases with increasing rates of reaction. When all the concentration gradients approach zero, the resulting concentration was demonstrated to be a weighted average of the saturation concentrations for the individual minerals. The qualitative aspects of the predicted concentration behavior were in agreement with both field and experimental observations. (Visocky - ISWS)

Descriptors: *Zooplankton, North Carolina, Estuaries, *Larvae, Biomass, Fishes, Plankton.
Identifiers: Brevoortia-Tyrannus, Lagodon-Rhomboides, Leiostomus-Xanthurus, *Newport River(North Carolina).

Numerical abundance biomass, and caloric content of zooplankton were estimated from biweekly samples collected during 1970-1972 from the lower estuary of the Newport River, North Carolina. All 3 measurements generally were maximum during early fall and again in late winter or early spring. During Nov., larval fishes, primarily pinfish (Lagodon rhomboides), spot (Leiostomus Xanthurus), and menhaden (Brevoortia tyrannus), began entering the estuary. The larvae reached maximum abundance in the estuary during March and April. Zooplankton abundance declined significantly at this time during 1970 and somewhat later during 1971. We hypothesize that zooplankton abundance may control the survival of fishes during their transition from larvae to juveniles and that the larvae have a significant effect in reducing the standing crop of zooplankton. Analysis of the gut contents of these fishes indicated they feed predominantly on zooplankton. Routine metabolism of the larvae would require that the standing crop of larvae graze an average 10% of the 1970 standing crop of zooplankton daily during Jan.-May.--

ON A STOCHASTIC MODEL TO ESTIMATE TSUNAMI RISK,
Universidad Nacional Autonoma de Mexico, Mexico City. Facultad de Ingenieria.
O. A. Rascon, and A. G. Villarreal.
Journal of Hydraulic Research, Vol. 13, No. 4, p 383-403, 1975. 7 fig, 3 tab, 7 ref.

Descriptors: *Tsunamis, *Coasts, *Stochastic processes, *Statistical methods, *Model studies, *Mexico, *Hawaii, Waves(Water), Earthquakes, Hydrography, Analytical techniques, *Risks, Probability, Estimating.
Identifiers: *Mexican Pacific coast, Bayes theorem.

In order to evaluate possibilities of exceedance of the maximum wave height during tsunamis along the Mexican Pacific coast, a statistical study was carried out on the tsunamis that have reached that coast. It was assumed that tsunamis follow a stochastic process represented by Poisson distribution which underlies earthquakes causing most of tsunamis. The available data was tested for consistency by split sampling. Since available data for the Mexican West Coast were scarce, data from other coasts having similar tectonic and hydrographic characteristics were incorporated by mean of Bayes theorem to obtain posterior probability densities. Estimation of the exceedance frequency for maximum amplitudes in the case of long recurrence periods was improved by a second order approximation method. The principal causes of wave height variations are the slope of the oceanic floor at the site, the existence of bays, reefs and promontories, the orientation of the wave front, and the distance to the place where the tsunami originates. AN INVESTIGATION OF SUSPENDED MATERIAL CONCENTRATIONS IN EASTERN LONG ISLAND SOUND,
Connecticut Univ., Groton. Dept. of Geology; and Connecticut Univ., Groton. Marine Sciences Inst.
W. F. Bohlen.
Journal of Geophysical Research, Vol. 80, No. 36, p 5089-5100, December 20, 1975. 12 fig, 30 ref. OWRT A-041-CONN (4) NOAA NG-20-72.

Descriptors: *Sediments, *Suspended solids, *Estuaries, Bays, Rivers, Erosion, On-site investigations, Sampling, Data processing, Analytical techniques, Sands, Silts, Salinity, Biological properties, Tides, *Connecticut River, Connecticut.
Identifiers: *Long Island Sound(Conn).

A 2-year record of monthly observations of suspended material concentrations at a network of 11 stations in eastern Long Island Sound was used to detail the characteristics of the concentration field and the factors governing its variability. These suspended material distributions display a high degree of spatial and temporal variability, there being only weak correlation between concentrations and concurrent salinity. This behavior contrasts sharply with observations in other regions of the sound. To determine the relative importance of hydrodynamic, meteorological, and biological factors, an ensemble average of selected station data is introduced. This average displays a seasonal variability that can be represented by the combined effects of streamflow and wind stress. Streamflow serves to produce a persistent background concentration. The occurrence of higher frequency fluctuations due to aperiodic discharge events appears limited by the volume and mixing characteristics of the eastern sound. Wind events will dominate the concentration field if high stress levels are maintained for more than 48 hours. Duration requirements are most commonly satisfied during the winter months. Materials introduced by streamflows and wind stress are distributed by the high energy tidal stream. Biological factors exert minor influence on the variability of the concentration field. A review of this system suggested that the eastern sound is more properly viewed as a coastal embayment than as an estuary. Mixing in this area establishes the eastern boundary conditions for the remainder of the sound. (Sims - ISWS)

EROSION ON THE LINE ISLANDS ARCHIPELAGIC APRON: EFFECT OF SMALL-SCALE TOPOGRAPHIC RELIEF,
Scripps Institution of Oceanography, San Diego. Marine Physical Lab.
W. R. Normark, and F. N. Spiess.
Geological Society of America Bulletin, Vol. 87, No. 2, p 286-296, February 1976. 11 fig, 2 tab, 42 ref. NSF GA-31377X.

Descriptors: *Marine geology, *Ocean circulation, *Sedimentation, *Erosion, *Bottom sediments, *Pacific Ocean, Glaciology, Instrumentation, On-site data collections, Tertiary period, Bathymetry.
Identifiers: Deep-towed instrumentation, Sea moats, Line Islands, Submarine peaks.

A moat on the southern edge and another in the northern portion of a small area on the northeast flank of the Line Islands archipelagic apron were studied, using a deep-towed geophysical instrumentation system. These studies showed that flow of bottom currents around relatively small bathymetric features (less than 200 m high) on the Line Islands apron has resulted in substantially more erosion than has occurred adjacent to a nearby ridge 1500 m high. Erosion has produced coalescing moats on the upcurrent sides of two basement outcrops that are the vestiges of a seamount nearly buried by sedimentary deposits of the apron. Pacific Bottom Water, moving eastward through nearby Kingman Passage, is thought to have eroded the moats during glacial periods. Episodic increases of eastward flow of Bottom Water may be occurring at present with velocities sufficient to form ripples within the sandy sediments of the moat floor. Within the same area, a large submarine ridge is flanked by a shallow moat that is merely the result of lower rates of deposition than on the surrounding sedimentary apron. (Singh-ISWS)

THE SALINITY EFFECT IN A MIXED LAYER OCEAN MODEL,
National Aeronautics and Space Administration, New York. Goddard Inst. for Space Studies.
J. R. Miller.
Journal of Physical Oceanography, Vol. 6, No. 1, p 29-35, January 1976. 4 fig, 2 tab, 9 ref.

Descriptors: *Salinity, *Ocean circulation, *Stratification, *Heat transfer, *Mixing, *Atlantic Ocean, Model studies, Temperature, Oceans, Saline water, Sea water, Thermal stratification, Movement, Diffusion, Circulation, Convection, Tropic, Subtropic, Path of pollutants.
Identifiers: *Mixed layer, Deepening rates.

A model of the thermally mixed layer in the upper ocean as developed by Kraus and Turner and extended by Denman was further extended to investigate the effects of salinity. In the tropical and subtropical Atlantic Ocean rapid increases in salinity occur at the bottom of a uniformly mixed surface layer. The most significant effects produced by the inclusion of salinity are the reduction of the deepening rate and the corresponding change in the heating characteristics of the mixed layer. If the net surface heating is positive, but small, salinity effects must be included to determine whether the mixed layer temperature will increase or decrease. Precipitation over tropical oceans leads to the development of a shallow stable layer accompanied by a decrease in the temperature and salinity at the sea surface. (Bender-ISWS)

TEMPERATURE AND SALINITY STRUCTURE IN THE WEDDELL SEA,
Scripps Institution of Oceanography, La Jolla, Calif.
T. D. Foster, and E. C. Carmack.
Journal of Physical Oceanography, Vol. 6, No. 1, p 36-44, January 1976. 5 fig, 29 ref. NSF GV-34905.

Descriptors: *Antarctic, *Water circulation, *Temperature, *Salinity, *Convection, *Antarctic Ocean, Circulation, Ocean circulation, Saline water, Sea water, Upwelling, Mixing, Movement, Diffusion.
Identifiers: *Weddell Sea, Ekman flux, Double-diffusive convection, Cabbeling instability, Scotia Ridge, Cape Norvegia.

The general circulation of water in the Weddell Sea is part of a large cyclonic gyre. A section taken across this gyre from the Scotia Ridge to Cape Norvegia showed that the Warm Deep Water forms an asymmetric lens-like structure with the thickest portion south of the center of the sea. This large-scale feature of the Weddell Sea is evidently due to a divergent Ekman flux driven by the general atmospheric circulation and upwelling in the center of the gyre. Vertical profiles of temperature and salinity in the center of the gyre showed small step-like structures in the upper part of the transition from colder, less salty Winter Water to the warmer, saltier Warm Deep Water below and large step-like structures in the lower part of the transition region. Double-diffusive convection can take place in both regions. Circumstantial evidence indicated that the cabbeling instability is effective in the large-step region. Internal waves and shear instabilities may also be

mechanisms that contribute to the formation of the step-like structures. (Bender-ISWS)

J. van de Kreeke, and R. G. Dean.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 101, No. WW4, Proceedings Paper 11731, p 393-403, November 1975. 7 fig, 12 ref, 2 append. NSF GK-32654

Descriptors: *Lagoons, *Mass transfer, *Mixing, *Water circulation, Bays, Inlets(Waterways), Density currents, Convection, Diffusion, Mathematical studies, Analytical technique, Coastal engineering, Estuaries, Tides.
Identifiers: *Mass transport, *Gulf coast, *Atlantic coast, Flushing.

Tide-induced mass transport is examined in coastal lagoons which are connected to the ocean by more than one opening. An approximate analytic expression for the tide-induced mass transport in a lagoon of uniform width and depth at each end freely connected to a tidal basin was derived, assuming one-dimensional homogeneous flow. Analytic results were compared with numerically computed values of the mass transport. It was shown that the tide-induced mass transport can be an important factor in the renewal of the waters of shallow lagoons. However, since tide-induced mass transport is proportional to the ratio a/h to the second power, where a = amplitude of the tidal wave and h = depth with respect to still water level significant mass transport should be expected only in shallow lagoons. CLASSIFICATION OF WETLANDS VEGETATION USING SMALL SCALE COLOR INFRARED IMAGERY,
Smithsonian Institution, Edgewater, Md. Chesapeake Bay Center for Environmental Studies.
F. S. L. Williamson, B. L. Rice, and D. F. Cassel.
Available from the National Technical Information Service, Springfield, Va 22161 as N75-17768, $4.00 in paper copy, $2.25 in microfiche. Annual Report, October 9, 1973 to December 20, 1974, NASA CR-62091, February 1975. 26 p, 8 fig, 16 ref. NASA NAS6-1913.

Descriptors: *Remote sensing, *Wetlands, *Vegetation, *Chesapeake Bay, Aerial photography, Infrared radiation, Photography, *Classification, Marshes, Plant groupings, Data processing, Marsh management.

The purpose of the research reported was to consider classification systems for Chesapeake Bay wetland vegetation. Data processing programs were tested for remotely sensed data on color infrared aerial photos from a small wetlands area and performed detailed vegetation ordinations on field data from another marsh site. Small scale (1:130,000) imagery can, after being digitized and computer processed, distinguish between species associations of Spartina patens/Distichlis spicata, Juncus roemerianus, Spartina alterniflora, and mixtures which are predominantly Scirpus olneyi. Estimates made from the computer-produced map of the areas covered by each association are only approximate and may err by as much as 50%. Two consecutive frames of a marsh scene were classified individually. The class designations for vegetation types were the same for both frames, with the exception of the reversal of one of the water classes with one of the Spartina patens classes. The spectral values (spectral signatures) for classes were not the same for both frames, suggesting that standardization of signatures for native plant associations will be difficult. (Sims-ISWS)

Descriptors: *Tides, *Tidal waters, *Theoretical analysis, *Oceans, Sea level, Water levels, Water circulation, Tidal streams, Water level fluctuations, Open channel flow, Mathematical studies, Finite element analysis, Analytical techniques, Continuity equation, Equations, Forecasting, Waves(Water), Harbors, Rivers, Junctions, Coasts, Estuaries.
Identifiers: *Tidal equations, Equations of motion.

Development of tidal theory since 1964 was presented in three broad subject areas. (1) Analysis of tides dealt with the basic equations for the prediction of tides. The tidal potential was presented with two methods for tidal prediction: the harmonic method and the response method. A practical application of the harmonic method also was given. (2) Tidal equations discussed the hydrodynamic tidal equations for the dynamic behavior of the tides, for which emphasis was given to the vertical velocity distribution in the derivation of the equations. The convective terms in the dynamic equations were studied separately by introducing terms containing the energy head and the rotor of the velocity vector. The relation between the rotor and the circulation of the water movement was also mentioned. (3) Tidal computations dealt with tidal computations in rivers, seas, and coastal waters. A brief historical review of various methods of computation was given. The harmonic method and the characteristic method were discussed in general terms. The theory of the Kelvin wave for seas with parallel coastal lines was given in more detail because of its theoretical interest for the explanation of the amphidromic points. The main part of this section was devoted to the finite-difference methods to be applied on an electronic computer. More detailed examples of explicit and implicit schemes were given for one- and two-dimensional tidal regions, and practical results were presented. (See also W76-06412) (Humphreys-ISWS)

INVENTORY OF FLORIDA COASTAL ZONE PLANNING PUBLICATIONS: VOLUME I, COASTAL COUNTIES AND CITIES.
Florida Dept. of Nautral Resources, Tallahassee. Bureau of Coastal Zone Planning.
September 1975, 103 p.

Descriptors: Publications, *Bibliographies, *Florida, *Coasts, Documentation, Coastal engineering, Coastal marshes, Coastal plains, *Cities, *Planning, *Surveys.
Identifiers: *Florida coastal zone, Florida publications, Florida bibliographies, Florida coastal counties, Florida coastal cities.

Volume I inventories those planning documents which have application to one of the 38 coastal counties or to any of the cities lying within the designated coastal zone of the county. (See also W76-06567 and W76-06568)(NDAA)
W76-06566

INVENTORY OF FLORIDA COASTAL ZONE PLANNING PUBLICATIONS: VOLUME II, MULTI-COUNTY PLANNING DISTRICTS.
Florida Dept. of Natural Resources, Tallahassee. Bureau of Coastal Zone Planning.
September 1975, 32 p. 04-4-158-50018, PL 92-583.

Descriptors: Publications, *Bibliographies, *Florida, *Coasts, Documentation, Coastal engineering, Coastal marshes, Coastal plains, *Surveys, Planning.
Identifiers: *Florida coastal zone, Florida publications, Florida bibliographies, *Planning districts.

Volume II includes those planning publications with a regional perspective. Documents in this volume address either the respective planning district as a whole, or areas encompassing more than one county within the district. (See also W76-06566 and W76-06568) (NOAA)
W76-06567

INVENTORY OF FLORIDA COASTAL ZONE PLANNING PUBLICATIONS: VOLUME III, STATEWIDE.
Florida Dept. of Natural Resources, Tallahassee. Bureau of Coastal Zone Planning.
September 1975, 22 p. 04-4-158-50018, PL-92-583.

Descriptors: Publications, *Bibliographies, *Florida, *Coasts, Documentation, Coastal engineering, Coastal marshes, Coastal plains, *Surveys, Planning.

Identifiers: *Florida coastal zone, Florida publications, Florida bibliographies, *Planning districts.

Volume III inventories those relevant documents that focus on either the state of Florida as a whole, or on areas that overlap planning district boundaries. (See also W76-06566 and W76-06567) (NOAA)

ANALYSIS AND INTERPRETATION OF LITTORAL ENVIRONMENT OBSERVATION (LEO) AND PROFILE DATA ALONG THE WESTERN PANHANDLE COAST OF FLORIDA,
Coastal Engineering Research Center, Fort Belvoir, Va.
J. H. Balsillie.
Available form the National Technical Information Service, Springfield, Va. 22161 as AD/A-009 755 $5.50, in paper copy, 2.25 in microfiche. Technical Memorandum No. 49, March 1975. 104 p, 33 fig, 12 tab, 63 ref. 5 append.

Descriptors: *Coasts, *Geomorphology, *Littoral drift, *Florida, Sediments, Sedimentation, Sands, Sediment transport, Beaches, Beach erosion, Winds, Storms, On-site investigations, Aerial photography, Remote sensing, Waves(Water), Ocean waves, Currents(Water).

In 1969, observation and profile stations were established along a 100-mile segment of the western panhandle coast of Florida. Visual measurements of littoral phenomena were taken using systematic techniques of the Littoral Environment Observation (LEO) Program. At six LEO stations, daily observations were made of breaker height, period, and direction of approach, longshore current speed and direction, and windspeed and direction. Foreshore slope was measured daily, and sand samples were collected monthly. Monthly profiles were measured from piers at six localities. Breaker heights were found to increase from east to west. Waves approached the shoreline from eastern quadrants a greater percent of the time than from western quadrants especially along the western part of the study area, showing agreement with net westerly directed longshore current and longshore transport movement, and dominant wind approach directions. Net annual longshore currents ranged from 0.50 to 0.30 ft/s, and were higher in magnitude along the western part of the study area than along the eastern segment. Predicted net annual longshore transport rates ranged from 196,000 to 274,000 cubic yards per year, and again were larger to the west than to the east. Volume change between consecutive monthly profiles indicated net losses of sediment from the littoral zone along most of the study area, with only serious losses at one locality along the western segment. Profile data and aerial photos showed the coast to be characterized by a dual bar system--an inner bar that at times is linear and at other times is broken and sinuous; and an outer, more continuous, persistent bar that acts as a buffer to storm wave attack. OBSERVATIONS OF CURRENTS AND TEMPERATURES IN THE SOUTHEAST FLORIDA COASTAL ZONE DURING 1971-72,
National Oceanic and Atmospheric Administration, Boulder, Colo. Environmental Research Labs.
D. A. Mayer, and D. V. Hansen.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. NOAA Tech. rpt. ERL 346-AOML 21, June 1975. 36 p, 11 fig, 5 tab, 3 ref.

Descriptors: Oceans, *Oceanography, *Ocean currents, *Temperature, Tides, Tidal currents, Ocean tides, Velocity measurement, Water flow, Temperature measurement, *Florida, *Coasts.
Identifiers: *Tidal motions, *Current measurement, Coastal water, Coastal zone, Southeast Florida.

Southeast Florida's coastal processes, including currents, temperatures, and wind movements, are described. Fluxes of heat and momentum computed using temperature and velocity measurements as observed in the coastal waters are described. The data recorded indicated that the long, narrow, and shallow shelf region of Southeast Florida is distinctly different from the deeper offshore water where the dominant motions are those of the Florida Current. The shallow water is primarily wind driven, but also subject to tidal motions near tidal inlets. In long current measurement records, the net northward motion is nearly zero. In the winter, the temperature of coastal water is less than the temperature of offshore water by about 1/2 degrees C/km. This positive east-west gradient of temperature is caused by the frequently occurring cold fronts which pass regularly over South Florida in the winter. The momentum flux that had the most spatial variation and, hence, whose divergence was also the largest, was the low frequency covariance between the north and east components of current where its sign actually changed from -26 to 20 cm 2/sec 2 over a distance of only 2 km. (NOAA).

PENETRATION OF THE DEEP LAYER OF THE SAGUENAY FJORD BY SURFACE WATERS OF THE ST. LAWRENCE ESTUARY,
Laval Univ., Quebec. Departement de Biologie.
J. C. Therriault, and G. Lacroix.
Journal of the Fisheries Research Board of Canada, Vol. 32, No. 12, p 2373-2377, December 1975. 5 fig, 9 ref.

Descriptors: *Fjords, *Penetration, *Surface waters, *Canada, *St. Lawrence River, *Chemical properties, *Physical properties, Biological properties, Physicochemical properties, Analytical techniques, Chemical analysis, Oceans, Chlorophyll, Plant pigments, Salinity, Water quality, Water temperature, Phosphates, Nitrates, Dissolved oxygen, Destratification, Seasonal, Nutrients.
Identifiers: Saguenay Fjord, St. Lawrence estuary, Surface water penetration, Flood tides, Advected waters.

A strong similarity is demonstrated in summertime physicochemical characteristics between the deep water of the Saguenay fjord and the surface water of the St. Lawrence estuary. Summer warming of the deep layer of the Saguenay is progressive from the mouth towards the head of the fjord. The mechanism proposed was the penetration of surface estuarine water over the shallow sill during the rising tide. The abnormally high chlorophyll values in this deep layer may be explained by the same advective mechanism. (Henley - ISWS)

UPWELLING ALONG THE YARMOUTH SHORE OF NOVA SCOTIA,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Oceanography.
C. J. R. Garrett, and R. H. Loucks.
Journal of the Fisheries Research Board, Vol. 33, No. 1, p 116-117, January 1976. 1 fig, 6 ref.

Descriptors: *Upwelling, *Coasts, *Ocean circulation, *Canada, Circulation, Tides, Tidal effects, Tidal energy, Coriolis force, Currents(Water), Estuaries, Oceanography.
Identifiers: *Nova Scotia, Centrifugal force.

Coastal upwelling seems to occur off the southwestern shore of Nova Scotia. It was suggested that this may be driven by centrifugal forces associated with the strong tidal currents past the convex coastline, in much the same way as secondary circulation is generated for river flow round a bend. (Sims-ISWS)
W76-06688

A SIMPLE TOPOGRAPHIC MODEL OF GULF STREAM SEPARATION,
Monash Univ., Clayton (Australia). Dept. of Mathematics.
N. R. Smith, and C. B. Fandry.
Journal of Physical Oceanography, Vol. 6, No. 1, p 22-28, January 1976. 10 fig, 28 ref.

Descriptors: *Model studies, *Ocean circulation, *Atlantic Ocean, *Mathematical models, Circulation, Currents(Water), Winds, Topography, Boundary layers, Oceanography.
Identifiers: *Gulf Stream.

A simple, frictional, linear model was used to study the motion of the Gulf Stream over the con-

tinental shelf. It was found that the combination of frictional and topographic effects may provide a further mechanism by which the observed separation of the Gulf Stream may be achieved. The model predicted separation in the form of a classical separated boundary layer and interrelated the slope of the bottom with the position of separation. Counter-circulations northwest of the stream and increased northward transport of the current were also predicted. (Sims-ISWS)
W76-06689

VERTICAL STRUCTURE OF CURRENTS AND DEEP TEMPERATURES IN THE WESTERN SARGASSO SEA,
Lamont-Doherty Geological Observatory, Palisades, N.Y.
T. E. Pochapsky.
Journal of Physical Oceanography, Vol. 6, No. 1, p 45-56, January 1976. 11 fig, 2 tab, 12 ref. ONR N0014-67-A-0108-0011, NSF GX 30987.

Descriptors: *Ocean circulation, *Ocean currents, *Temperature, *Atlantic Ocean, Currents(Water), Velocity, Sampling, Measurement, On-site investigations, On-site data collections, Buoys, Floats, Oceanography.
Identifiers: *Sargasso Sea, Temperature profiles, Velocity profiles.

Currents and temperatures were measured as a function of depth at two locations during the Mid-Ocean Dynamics Experiments of 1972-73. Instrumented profiling floats were used and flows were determined by acoustic ranging. In some instances floats were trimmed to hover at definite depths in order to increase the resolution and measure local details. The barotropic flows were large, 4.6 cm/s at the 28 deg N, 69 deg 40 min W location and 7.8 cm/s at the 28 deg N, 68 deg 40 min W location. The energy density of the first baroclinic mode was larger than that of the barotropic flow at both locations. The shapes of the horizontal trajectories of the profiling floats changed only slowly from day to day. Superimposed on these profiles were velocity variations of the high vertical wavenumber modes associated with inertia and internal waves. They were within a band of + or -1.5 cm/s below the thermocline and + or -3.5 cm/s in the thermocline. Current profiles as well as hodographs of the velocity on descent showed a chaotic modal structure for those higher frequencies. There was a suggestion of a relationship between the velocity fluctuations profiled and profiles of the temperature or temperature gradient only in a high-resolution section of data near a depth of 2 km. The occurrence of Richardson numbers near unity was fairly common over depth intervals of approximately 100 m. (Sims-ISWS)

THE DYNAMIC STRUCTURE OF THE FRONTAL ZONE IN THE COASTAL UPWELLING REGION OFF OREGON,
Rosenstiel School of Marine and Atmospheric Science, Miami, Fla.
C. N. K. Mooers, C. A. Collins, and R. L. Smith.
Journal of Physical Oceanography, Vol. 6, No. 1, p3-21, January 1976. 16 fig, 5 tab, 64 ref. NSF GP4472, GA[illegible], GA27296.

Descriptors: *Upwelling, *Coasts, *Oregon, *Pacific Ocean, Ocean currents, Currents(Water), On-site data collections, On-site investigations, Temperature, Salinity, Continental shelf, Continental slope, Oceans, Oceanography.
Identifiers: Pycnoclines.

The frontal zone of the coastal upwelling region off Oregon was studied from observations made between July and September in 1965 and 1966. The alongshore flow field was determined by combining direct measurements and geostrophic calculations. A near-surface southward jet and a subsurface northward undercurrent existed in the frontal zone. They were separated by an inclined frontal layer (permanent pycnocline). The frontal layer tended to intersect the sea surface about 10 km offshore, where a surface front was formed. Through a combination of direct current measurement and water mass analysis, the cross-stream flow was estimated to be seaward near the surface, shoreward at the top of the inclined frontal layer, but seaward at the bottom of the inclined frontal layer and shoreward below that. During a 25 h anchor station, a high degree of correlation existed between the vertical structure of the alongshore and cross-stream flows. An anomalously warm water mass occurred at the base of the frontal layer. It is believed that it was formed near the surface front and that it sank and flowed seaward along the base of the inclined frontal layer. Vertical shears in the horizontal velocity were caused by the mean baroclinic flow and the tidal and longer period baroclinic oscillations. (Sims - ISWS)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

THE RALPH M. PARSONS COMPANY CONCEPTUAL DESIGN OF A 50 MGD DESALINATION PLANT.
Parsons (Ralph M.) Co., Pasadena, Calif.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-251 584, $9.00 in paper copy, $2.25 in microfiche. Special Report No. 12, August 1965, 492 p, 24 fig, 9 tab. OSW 14-01-0001-516.

Descriptors: *Desalination, Distillation, *Flash distillation, Sea water, *Heat transfer, Design, Instrumentation, *Evaporation, *Condensation, Economics, Evaluation, Costs, *Design criteria.
Identifiers: *Process design.

The objective of this study is to produce a design which advances the technology of seawater conversion and to present the results in a form which can be used by any qualified individual or firm as the basis for an architectural-engineering design. Ground rules furnished by OSW specified that only the desalination section of a dual-purpose power-water plant be considered and that it be designed for a 30-year life. Process and structural design ideas are to be presented in terms of the complete plant concept. The complex is to be located on a typical California coastal site with capital and operating costs based on December, 1964, values. This design concept is based on the multistage flash process consisting of 94 heat recovery stages and 4 heat rejection stages with a maximum brine temperature of 273F. Plant consists of three parallel lines each supplying one-third the total output, each operating independently of the others to facilitate maintenance and repairs. Vessels are of corrugated metal pipe arch section permitting longitudinal thermal expansion to be absorbed within the vessel walls. Interior surfaces of the vessels exposed to seawater are cupro-nickel clad. 70-30 CuNi is selected for heat exchange surfaces. Cost of product water is $0.525 per thousand gallons. (See also W76-00158 thru W76-00173.) (OWRT)
W76-06151

DESALTING PLANTS INVENTORY, REPORT NO. 4,
Office of Saline Water, Washington, D.C.
F. O'Shaughnessy.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-251-575, $4.00 in paper copy, $2.25 in microfiche. March, 1973, 27 p, 1 fig, 4 tab.

Descriptors: *Desalination plants, Surveys, *Distillation, Water supply, *Membrane process, *Freezing, Sites, Dual purpose, Fuels, Electric power plants.

Summary information is provided on location, size, type of process, year construction began or of plant commissioning, and name of process contractor. Also included, when and as provided by the manufacturer, are data on type of water feed, product water use, type of fuel used, and whetner or not a desalting plant operates in conjuction with an electric power generating plant (single or dual purpose). According to manufacturer's information, there were 812 land-based desalting plants of 25,000 gallons-per-day capacity or larger in operation or under construction throughout the world as of January 1, 1972. These plants are capable of producing about 348 million gallons of fresh water daily for cities and industries. Distillation is the most widely used, accounting for 93% of total capacity. The balance is almost entirely in membrane processes, with freezing accounting for less than 1%.

CONVERSION OF DESALINATION PLANT BRINES TO SOLIDS,
Badger (W. L.) Associates, Inc., Ann Arbor, Mich.
F. C. Standiford.
OWRT/S--76/29, October 10, 1970. 118 p, 29 fig, 9 tab, 27 ref. DoI 14-30-2660.

Descriptors: *Dissolved solids, Desalination plants, Brines, *Brine disposal, *Desalination, Distillation, Solar evaporation, Ponding, Cost comparisons, Injection wells, Waste disposal, Solid wastes, Feasibility.
Identifiers: Deepwell injection.

This final report of a study to investigate means of turning desalination plant waste brines into solids for disposal surveys the chemical and process industries to determine those processes which have a potential for removing or reducing solids from solution when treating the brine effluent from disalination plants. It attempts to determine the potential size limitations of various methods and by comparing advantages and disadvantages to determine the economic feasibility of each. A conceptual design is presented for a plant treating the effluent from a 2.5 MGD desalination plant to evaluate the feasibility of such a system and provide plant scaling factors for 1 to 10 MGD plants. Capital and operating cost estimates are provided.
W76-06248

PARAMETRIC DATA FOR LONG TERM OPERATION OF A VERTICAL, PLANE SURFACE, FALLING FILM, VAPOR COMPRESSION EVAPORATOR,
Resources Conservation Co., Renton, Wash.
H. Herrigel, T. O'Neail, and T. Fosberg.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-251 694, $4.00 in paper copy, $2.25 in microfiche. OWRT/S--76/30, June 1973. 42 p, 15 fig, 4 tab, 1 ref. DoI 14-30-2939.

Descriptors: *Desalination, *Distillation, *Vapor compression distillation, Evaporators, Chemical analysis, *Aluminum alloys.
Identifiers: Falling film, Solids concentration.

A long term test was conducted to demonstrate the ability of a vertical, plane surface, falling film, vapor compression evaporator to concentrate Roswell, N. Mex. brackish well water without scaling. The 14,000 mg/l TDS Roswell well water was concentrated 11 times to 145,000 mg/l TDS and a 17,500 mg/l natural suspended solids level. The system operated for a total of 112 days during this test program with the longest continuous run being 77 days. The tests were successful in demonstrating the long term effectiveness of the process and equipment.
W76-06249

OPERATING DATA OF A VERTICAL PLANE SURFACE, FALLING FILM EVAPORATOR USING SLURRY AND HIGH CONCENTRATION FEEDS,
Resources Conservation Co., Renton, Wash.
H. Herrigel, T. Fosberg, W. Stickney, and C. Perry.
Available from the National Technical Service, Springfield, Va 22161 as, PB-251 695, $5.50 in paper copy, $2.25 in microfiche. OWRT/S--76/27, October 1972. 102 p, 29 fig, 11 tab, append. DoI 14-30-2939.

Descriptors: *Brackish water, *Corrosion control, Operations, *Scaling, *Evaporators, *Desalination, Design.
Identifiers: Boiling point elevation, pH control, Falling film evaporation, Seeding processes.

Demonstration tests with a 5,000 gpd Laboratory Research Unit (LRU) substantiated the ability of a vertical, plane surface, falling film evaporator to take Roswell, N. Mex brackish, well water to high concentrations without scaling. Two series of test conditions were run, each for a period of approximately 20 days. Tests were run at about 11 concentrations and at 25 concentrations over a range of condensing temperatures. Heat transfer coefficients above 1,000 Btu/hr-ft2-F degrees were consistently achieved throughout the tests. Process conditions were identified and verified for scale-free operation. A conceptual design and economic study of a 2.5 mgd plant (based on feed rate) showed that 90 percent of the Roswell brine could be converted to fresh water at a recovery rate of 24.7 pounds of water per 1,000 Btu. Ninety-six percent conversion may be achieved at an overall rate of 22.3 pounds per 1,000 Btu with increased capital costs. Cost of product water from the 2.5 mgd plant is $2.08/1,000 gallons for 96 percent conversion.
W76-06250

COMPUTATIONAL METHODS APPLICABLE TO THE COUPLED VTE/MSF DISTILLATION SYSTEM,
Electronic Associates, Inc., West Long Branch, N. J.
B. T. Fairchild, and C. S. Rhee.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-251 640, $5.00 in paper copy, $2.25 in microfiche. OWRT/S--76/25, September 1973. 80 p, 4 fig, 10 tab. DoI-14-30-2845.

Descriptors: *Desalination, *Distillation, *Evaporators, Flash distillation, *Computer models, *Simulation analysis.
Identifiers: *VTE/MSF distillation system, Process variables, Flash stage, Vertical tube effect.

The Orange County Plant was selected initially as an example of a VTE/MSF system for the current study. However, before completion, it was directed that the Freeport Test Bed Plant be implemented. Since the computer programs were structured in a modular fashion, the contract effort was easily diverted. The vertical tube effect/multistage flash portion of the Freeport Test Bed Plant is simulated to provide steady-state profiles of all important process variables for a variety of process specifications. Mathematical models are developed for a flash stage, a vertical tube effect, a vapor flow stream, and a brine heater. Those components are combined for the Freeport Plant, and appropriate convergence schemes are applied to obtain consistent solutions. Computer programs are structured in a modular fashion such that similar systems may be conveniently implemented. For the current study, emphasis is not placed on generation of extensive steady state results, but rather on demonstration of a capability for producing consistent steady state results for a variety of process specifications.
W76-06253

VERTICAL TUBE DISTILLATION DESALTING, STATE-OF-THE-ART (1971), NOMOGRAPH BOOKLET.
Hittman Associates, Inc., Columbia, Md.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-251 687, $5.00 in paper copy, $2.25 in microfiche. OWRT/S--76/24, January 1972. 58 p, 17 tab, 22 ref. DoI-14-01-001-1748.

Descriptors: *Desalination, *Distillation, *Evaporators, *Capital costs, Data collections.
Identifiers: *Vertical Tube Evaporators, *Process parameters, Product water cost, *Nomographs.

A series of nomographs were prepared which evaluate the cost and process parameters of vertical tube evaporator plants. The data used to compile these nomographs was taken from a series of Office of Saline Water R and D Reports, published articles, manufacturers information and actual plant data related to the process and its economics. The Economic data has been updated to a late 1971 base by use of engineering cost indices. Process parameter relationships utilized were updated in accordance with latest desalination data. The purpose of these nomographs is to allow estimates to be made concerning various cost and design parameters related to the vertical tube evaporator (VTE) process. Utilization of the nomographs will allow estimates of the cost of water, plant capital costs, cost of energy, and plant tubing area to be made.

W76-06254

VERTICAL TUBE DISTILLATION DESALTING, STATE-OF-THE-ART (1971).
Hittman Associates, Inc., Columbia.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-224 277, $6.75 in paper copy, $2.25 in microfiche.OWRT/S--76/23, November 1972. 142 p, 25 fig, 17 tab, 79 ref. DOI 14-01-001-1748.

Descriptors: *Evaporators, Flash distillation, *Desalination plants, *Distillation, Reviews, Performance.
Identifiers: Concentration ratios, *Vertical tube evaporators.

The state-of-the-art design, performance, and economics of downflow thin film vertical tube evaporator (VTE) desalting plants were analyzed and reviewed. Both single- and dual-purpose plants ranging in size from 1 to 250 MGD capacity were evaluated. The VTE has been in use for some time, but its application in large scale desalting projects is only 10 years old. The largest U.S. commercial plant is 1 ,GD (11 effects at a performance ratio of 9.3) and the largest experimental test bed is also 1 MGD (17 effects, performance ratio of 13.2). Designs ranging up to 250 MGD have been prepared. Recent innovations include integration of multistage flash (MSF) preheaters with the VTE equipment yielding apparent economies in materials, fabrication, and operation. Current technology emphasizes the use of enhanced surfaces for improvement of evaporation/condensation heat transfer. Concrete lined steel appears to offer long term corrosion resistance to hot seawater brines. Current plants and designs yield from 0.75 to 0.85 pounds of product water per 1000 Btu (initial heating steam) per effect at concentration ratios of 2.5 to 3.0. Two and three inch diameter evaporator tubes of Al-brass or 90-10 CuNi currently are the most attractive materials.

THE CONTROL AND OPERATION OF NUCLEAR DESALINATION SYSTEMS,
New South Wales Univ., Kensington (Australia). School of Nuclear Engineering.
L. G. Kemeny.
Journal of Hydrology (Amsterdam), Vol. 28, No. 2/4, p 449-468, February 1976. 7 fig, 3 tab, 12 equ, 7 ref, 2 append.

Descriptors: *Water resources, *Desalination plants, Operations research, Control, Optimization, Economics, Nuclear energy, Monitoring, Equations, Economics, Water treatment.
Identifiers: *Nuclear desalination systems.

The operation, control, and optimization of desalination plants in which the prime source of energy is derived from nuclear fuel and in which the sea or bore water is evaporated in multi-stage flash evaporator units presents no new scientific or technological. The unresolved difficulties associated with this technique are to be found more in the general fields of chemical control, corrosion prevention, and long term reliability. Herein, the 'desalination system' is assumed to consist of: (1) nuclear steam raising; (2) numerous multi-stage flash evaporator units; and (3) chemical water treatment plant. For non-technical reasons, only typical cases of plants in the ten to one hundred million gallon per day output size are considered, and specific references to nuclear system designs and operating flash evaporator installations are avoided. The paper is a condensed version of a manuscript which will be submitted for publication elsewhere. Discussed are system operation, characteristics of a typical plant, flash evaporator diagnosis, system control, nuclear plant dynamics (including nuclear time constants and boiler primary heat balance), and system optimization. In conclusion, a medium sized plant of the type described may be economically justified if built in Australia only after the most detailed cost optimization. (Bell-Cornell)

PRELIMINARY ENGINEERING ANALYSIS, YUMA DESALTING PLANT.
Burns and Roe, Inc., Paramus, N. J.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-251 873, $7.50 in paper copy, $2.25 in microfiche. OWRT/S--76/33, November 1974. 175 p, 14 fig, 19 tab, 2 append. 14-30-3270

Descriptors: *Desalination, *Desalination processes, *Membrane processes, Reverse osmosis electrodialysis, *Water treatment, Brackish water, *Irrigation, *Return flows, Cost analysis, Salinity control, Arizona, Colorado River.
Identifiers: Yuma Desalting Plant, Yuma Arizona, Lime softening process, Plant control membrane replacement criteria.

An evaluation was made of alternate membrane desalting and pretreatment processes, including cost estimates, for the 100 mgd Yuma Desalting Plant. Recommendations were also derived on procurement procedures, guarantee provisions, plant control and membrane replacement criteria. Both electrodialysis and reverse osmosis were considered for this application because of the salinity range projected for the Wellton-Mohawk drain water which would serve as the feed to the desalting plant. The lime softening process with solids contact reactors and dual media gravity filters was selected as the best pretreatment system. An additional advantage of the lime softening process is that reduction of the calcium and total dissolved solids increases the safety maragin for scale formation permitting temporary higher recoveries, if necessary, to maintain salt balance. The analysis concluded that the final plant configuration for the constructed desalting plant would be determined by competitive bidding and that more than one manufacturer will probably be supplying equipment for the final plant. Accordingly, a base case design and cost estimate was developed for a plant equally split, on the basis of salt removed between hollow fiber reverse osmosis, spiral wound reverse osmosis and electrodialysis.

10,000,000 GALLON PER DAY SECONDARY REFRIGERANT FREEZE DESALTING PLANT.
Dravo Corp., Pittsburg, Pa. Blaw-Knox Chemical Plants Div.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-251 906, $7.50 in paper copy, $2.25 in microfiche. OWRT/S--76/32, June 29, 1973. 121 p, 32 fig, 52 tab. DUI 14-30-3160

Descriptors: *Desalination processes, *Freezing, Sea water, Heat transfer, *Desalination plants, Potable water, Water treatment.
Identifiers: Butane, Direct contact, Continuous process.

This report describes a continuous process for producing potable water from sea water by partial freezing. Ice slurry is produced in a freezer by direct contact of sea water with liquid butane at the pressure slightly below atmospheric at which butane boils at the temperature of freezing saline water, deriving its heat for vaporization from ice formation. The resulting slurry of ice in brine is sent to a washer, where the ice is washed substantially free of salt, using part of the melted ice as the wash liquid. Washed ice is then melted by direct contact with slightly compressed butane vapor from the freezer. Butane condenses as it melts the ice, and condensate is recycled to the freezer. Cold from the potable water and product brine stream is recovered in the incoming feed by a heat interchange system employing vaporization and condensation of butane in direct contact with the aqueous streams. Since the system operates below ambient temperature and since heats of compression and pumping and heat in the feed sea water must be removed, heat is pumped from the system by compressing butane vapor not condensed in the melter to a pressure at which it can be condensed by the existing product streams.

A STANDARDIZED PROCEDURE FOR ESTIMATING COSTS OF SALINE WATER CONVERSION.
Office of Water Research and Technology, Washington, D. C.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-251 888, $4.50 in paper copy, $2.25 in microfiche. OWRT/S--76/31, March 1956. 45 p, 17 fig, 4 tab, 20 ref.

Descriptors: *Desalination, *Desalination processes, *Comparative costs, *Engineers estimates, *Estimated costs.
Identifiers: *Cost estimating procedures, Standardized costing procedures.

This report presents a standardized procedure for making initial cost estimates for demineralization of saline waters by various processes. Any given estimate will not necessarily represent the cost of a process at a specific location but will represent the order of magnitude for the water cost under the assumed conditions and permit valid comparison of various processes. Cost estimates are first approximations based on selected costs for investment, fuel and power, with approximations for labor, supervision, maintenance, and other items. The standardized cost estimating procedure is presented in three parts, (1) a summary of the items in tabular form for estimating the costs, (2) discussion of the many factors contributing to the cost estimating procedure, and (3) an appendix which includes cost estimates for various items of equipment, and analyses of saline waters.

SOLAR ENERGY TECHNOLOGY, STATE OF THE ART, AN ANNOTATED BIBLIOGRAPHY,
Ocean Engineering Information Service, La Jolla, Calif., Energy Resources Div.
E. Sinha, and B. McCosh.
Ocean Engineering Information Series Vol. 1 (1975), 83 p.

Descriptors: *Bibliographies, Reviews, Solar distillation, Solar radiation, *Distillation, *Desalination, Energy, *Energy conversion, Heat transfer, Desalination plants, Desalination apparatus.
Identifiers: *Solar energy.

This bibliography contains 547 informative abstracts of the worldwide literature providing substantial scientific and technological information on the state-of-the-art of solar energy utilization. Subjects covered include: patents; equipment and

materials (photovoltaic cells, collectors, concentrators, materials); buildings (heating, cooling - air conditioning); electric power generation (photovoltaic conversion with electric storage, solar-thermal conversion with heat storage); total energy systems; space solar power stations (geosynchronous satillite solar power plant, microwave transmission to earth); solar sea power plants; bioconversion; special applications (agricultural, desalination, distillation, Industrial, navigation aids and naval facilities); energy conversion; energy storage; heat transfer; availability, climate, solar radiation measurement; economic analysis - costs; bibliographies; and geographic sites of special studies. The usefulness of the bibliography is enhanced by the inclusion of a subject outline which is supplemented with a keyterm index and an author index. References were selected from literature published during the past five years but a few older ones of special current interest are included. The bibliography is intended to serve as an interdisciplinary guide to the state of the art.
W76-06565

PRELIMINARY DESIGN OF A DIESEL-POWERED VAPOR-COMPRESSION PLANT FOR EVAPORATION OF SEAWATER,
Oak Ridge National Lab., Tenn.
S. J. Senatore.
ORNL-4049, Special, (OSW RDPR276), December 1966. 123 p, 13 ref. DoI 14-01-0001-534.

Descriptors: *Desalination plants, Sea water, *Evaporators, Evaporation, *Vapor compression distillation, Capital costs, Operating costs.
Identifiers: *Vertical-tube evaporators.

The purpose was to determine whether the combination of a diesel engine or a gas turbine with a vapor compressor and a vertical-tube evaporator has good economic potential for desalting of seawater in plants of the 1- to 3-million-gallons-per-day (Mgd) range. The study concentrates on commercially available components which could be applied to a prototype or test bed plant with only a modest development effort. The study shows that the engine-driven vapor compressor-VTE concept has good potential for reducing the cost of distilled seawater in water-only plants of the size range 1 to 10 Mgd. The primary advantage of the system lies in its possibility of achieving heat economies of 20 to 27 lb product per 1000 Btu fuel consumption (for both heat and pumping energy), without the necessity of utilizing high brine temperatures or very low temperature differences. Alternative fuels are natural gas, diesel oil, or residual oil.

3B. Water Yield Improvement

WATER RELATIONS OF SELECTED SPECIES OF CHAPARRAL AND COASTAL SAGE COMMUNITIES,
San Diego State Univ., Calif. Dept. of Biology.
D. K. Poole, and P. C. Miller.
Ecology, Vol. 56, No. 5, p 1118-1128, Late Summer, 1975. 11 fig, 1 tab, 30 ref.

Descriptors: *Plant physiology, *Soil-water-plant relationships, *Moisture stress, *Turgidity, *Chaparral, *Sagebrush, Drought tolerance, Stomata, Moisture uptake, Moisture availability, Water balance, *California, Coasts, Semiarid climates, Shrubs, Soil moisture.
Identifiers: Artemisia californica, Schlerophylls, Arctostaphylos glauca, Ceanothus greggii, Rhus ovata, Rhus laurina, Rhus integrifolia, Adenostoma fasciculatum, Heteromeles arbutifolia.

Water potentials, leaf resistances to water loss, and relative saturation deficits of selected shrub species were measured from June 1973 through May 1974 at coastal and inland sites in southern California. Both the chaparral and coastal sage communities occur in a semiarid Mediterranean-type climate characterized by hot, dry summers and cool, wet winters. By December, the drought-deciduous Artemisia californica had water potentials less than -65 bars. The evergreen species sclerophylls was divided into 3 categories: (1) Arctostaphylos glauca and Ceanothus greggii developed lowest water potentials (less than -65 bars) and showed stomata least responsive to water potential, 2) Rhus ovata, Rhus laurina, and Rhus integrifolia had highest water potentials (about -25 bars) and stomata most responsive to water potential, and (3) Adenostoma fasciculatum and Heteromeles arbutifolia exhibited intermediate water potentials and stomatal responses. Water stress occurred earlier in the summer at the coastal site because of less rainfall. Where competition was most severe (on north facing slopes), soil moisture was reduced earlier in the summer and as a result, soil moisture content and plant water potentials were higher on the south-facing slope at the inland site. MORE WATER FOR ARIZONA.
Arizona Water Resources Committee, Phoenix; and Arizona Water Commission, Phoenix.
September 1974. 28 p, 18 fig, 1 tab.

Descriptors: *Water yield improvement, *Arizona, *Water resources, *Water harvesting, *Watershed management, *Surface runoff, Water conservation, Water yield, Runoff, Snowpacks, Vegetation effects, Forest management, Water supply, Groundwater resources, Recreation, Lumber.

Arizona's current annual water demand is about 7 million acre-feet, of which about 2 million comes from surface water sources and the remaining 5 million from pumped groundwater. Of this 5 million from groundwater, about 2 or 3 million acre-feet is overdrought. Arizona's water supply for municipal, industrial, agricultural and recreational uses can be increased significantly by management of vegetation on watersheds. Often, the same management practices which produce such increases will also result in improved production of timber, forage and water for livestock and game, and recreational values. An improvement of the aesthetic aspects of the land plus alleviation of such problems as fire control and soil erosion are also realized in many cases. As much as 1,200,000 acre-feet of water a year on the average could be harvested to supplement Arizona's present supply of surface water. Before initial judgments can be made as to whether or not a given watershed can be made more productive, a comprehensive inventory of data on precipitation, slope angle, soil type and depth, vegetation densities, and existing priorities of land use and values is necessary. In addition, there still remains the scientific need for the development of reliable means to extrapolate information gained from small experimental plots to large, operational areas. LARGE SCALE EFFECTS OF CLOUD SEEDING,
Aerometric Research, Inc., Goleta, Calif.
K. J. Brown, R. D. Elliott, and J. R. Thompson.
Report ARI 75-2, June 1975. 230 p, 30 fig, 4 tab, 28 ref, 8 append. 14-06-D-6841.

Descriptors: *Weather modification, Precipitation(Atmospheria), *Cloud seeding, Cloud physics, Rainfall.

At the conclusion of a nine year study to determine the Large Scale Effects of Cloud Seeding, the statistical evidence indicates that modification of precipitation patterns over a large area is a persistent feature in all of the winter orographic seeding programs studied. The most frequent location for these extra-area effects is 150-200 km from the seeding source and 20 to 40 deg to the right of the 700 mb wind flow. The extra-area effect is always of the same sign and generally slightly larger in magnitude than the primary seeding effect. It is hypothesized that the major extra-area enhancement of precipitation occurs during those portions of orographic storms containing organized convection. The increase in precipitation would be due to an enhancement of convective activity by conversion of water to ice with attendant changes in meso-scale circulation patterns which result in prolonging the convective activity. A secondary zone of enhanced precipitation frequently appears about 150-200 km downwind from the seeding source. This area appears to be merely an extension of the primary seeding effect due to the long trajector of small ice crystals produced by seeding. The quantity of precipitation produced in this area is small and only detectable when it occurs in a normally arid region. (Bureau of Reclamation)

COLORADO RIVER BASIN PILOT PROJECT, FINAL COMPREHENSIVE OPERATIONS REPORT,1970-1975 SEASON,
EG and G, Inc., Durango, Colo. Environmental Services Office.
L. M. Hjermstad.
Report AL-1200, Dec. 23, 1975. 161 p, 41 fig, 31 tab. 14-06-D-6963

Descriptors: *Artificial precipitation, Atmosphere, *Colorado, *Cloud seeding, Clouds, Forecasting, Meteorology, Nucleation, Orography, River basins, Silver iodide, Snow, Snowpack, Storm structure, *Weather modification, Colorado River Basin, Precipitation(Atmospheric).
Identifiers: San Juan Mountains(Colo).

Operational aspects are summarized of five winter seasons of weather modification research under the Colorado River Basin Pilot Project. The program was a randomized research seeding program under the direction of the Bureau of Reclamation. All aspects of the program design, field equipment, operational criteria plan, opportunity recognition forecasting, and seeding operations for the five operational seasons are reviewed. Evaluation of experimental data collected during the operational periods of the program indicate that the orographic cloud systems over the San Juan Mountains respond to seeding with silver iodide similar to orographic cloud systems seeded in the vicinity of Climax, Colorado. (Bureau of Reclamation)

LIBRARY OF U. OF I. URBANA-CHAMPAIGN

Water harvesting depends on natural precipitation and is therefore limited to areas where precipitation is sufficient and variability is not excessive. The particular water harvesting method used to collect precipitation depends on several factors including soil type and depth, vegetative cover, surface roughness and slope, climatic factors, land, labor, and material costs, water use rate and distribution, water quality desired, and availability of materials. Commonly used methods are vegetation management, land alteration, chemical or physical soil treatments, and soil covers. Annual precipitation in excess of 280 mm is generally required for successful vegetation management results with runoff yield increasing as annual precipitation increases. Land alteration is especially attractive where impervious areas already exist and only collection and storage facilities are required. Land alteration is economically feasible in areas where labor costs are low and soil conditions are suitable. Successful chemical and physical soil treatments have been applied to certain soils, but more research is needed to delineate the conditions under which each can be used. Soil covers are generally not restricted by soil and climatic conditions but usually have a higher initial cost than other methods. Water collected from catchments can be stored in the soil, excavated ponds, bags, or tanks. (Robinett-Arizona)

SALTCEDAR (TAMARIX CHINENSIS) SEED PRODUCTION, SEEDLING ESTABLISHMENT, AND RESPONSE TO INUNDATION,
Geological Survey, Tucson, Ariz.
D. K. Warren, and R. M. Turner.
Journal of the Arizona Academy of Science, Vol. 10, No. 3, p. 135-144, October, 1975. 11 fig, 1 tab, 13 ref.

Descriptors: *Tamarisk, *Riparian plants, *Seeds, *Plant growth, *Submergence, *Reproduction, Phreatophytes, Vegetation effects, Plant physiology, Resistance, Germination, Willow trees, Cottonwoods, *Arizona.
Identifiers: San Carlos Reservoir(Ariz), San Pedro River(Ariz).

Saltcedar has become established in large areas around reservoirs, streams, and rivers, notably in the arid southwest, since its introduction into the U.S. Although reasons for its replacement of native riparian species are not fully known, observations indicate that a high rate of seed production and an effective means of dissemination have, in part, led to saltcedar's rapid spread. The plant's ability to survive long periods of inundation and to reinvade as water recedes have probably been additional factors in its spread around reservoirs. Studies were conducted along the shore of the San Carlos Reservoir and on the San Pedro River in southeastern Arizona. Seed production in a dense stand of saltcedar yielded 17 seeds per square centimeter during the 5 1/2 month seed producing season. This seed production was compared with seed production in two native riparian species, seepwillow (Baccharis glutinosa) and cottonwood (Populus fremontii). The rate of establishment of saltcedar seedlings on the banks of a reservoir with receding water level corresponded closely to the rate of seed production of nearby plants. Greatest seedling establishment occurred between early May and mid-June. Mature saltcedar plants were able to survive complete submergence for as long as 70 days, and without complete submergence, up to 98 days. (Robinett-Arizona)

MANAGING CHAPARRAL FOR WATER AND OTHER RESOURCES IN ARIZONA,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
A. R. Hibbert, E. A. Davis, and T. C. Brown.
In: Watershed Management, Proceedings Irrigation and Drainage Division American Society of Civil Engineers, August 11-13, 1975, Logan, Utah, p. 445-468. 8 fig, 30 ref.

Descriptors: *Chaparral, *Watershed management, *Water yield improvement, *Vegetation effects, *Surface runoff, *Arizona, Livestock, Water supply, Water quality, Forages, Erosion, Revegetation, Land development, Water harvesting, Land management, Water yield, Vegetation, Grasslands, Grasses.

The chaparral vegetation type of the interior Southwest is found almost exclusively in Arizona, where it occupies some 3 to 4 million acres of rough, broken terrain in the central part of the state. While land managers rate chaparral low in commercial value, it yields about 0.1 acre-foot of good quality water per acre per year, and produces forage and browse for big game and livestock. Because of a dwindling water supply in central Arizona, conversion of chaparral to grass has been considered as a means to augment streamflow. The key to increasing water yield is replacement of deep-rooted shrubs with shallow-rooted grasses and forbs. Shrub roots ramify the entire soil mantle and can deplee the soil-water reserve to a greater extent than grasses and forbs. In previous experiments on treated watersheds, streamflow increased from 28 percent in open brush with low rainfall to more than 300 percent in dense brush with high rainfall. Conversion practices may affect water quality by temporarily increasing suspended sediment and nutrient loads, and by contamination with herbicides. It is probable that erosion will increase for a time following most conversion practices with the greatest erosion from broadcast burning and the least from mechanical and chemical control of shrubs if replacement cover is established soon after treatment. Assuming that large-scale conversion techniques can be successfully applied, and that 735,000 acres of chaparral would eventually be converted to grass, the expected downstream increase would average about 150,000 acre-feet each year. (Robinett-Arizona)

VEGETATION MANAGEMENT FOR WATER AND RANGE IMPROVEMENT,
Arizona Univ., Tucson. School of Renewable Natural Resources.
P. F. Ffolliott, and D. B. Thorud.
In: Watershed Management, Proceedings Irrigation and Drainage Division American Society of Civil Engineers, August 11-13, 1975, Logan, Utah, p. 249-266. n.d. 16 ref.

Descriptors: *Watershed management, *Water yield improvement, *Surface runoff, *Vegetation effects, *Land management, Arizona, Erosion control, Forest management, Water yield, Vegetation, Range management, Coniferous forests, Ponderosa pine trees, Juniper trees, Pinyon pine trees, Chaparral, Grasslands, Desert plants, Riparian plants, Water harvesting.
Identifiers: *Vegetation management.

A review is presented of current water yield improvement experiments in Arizona in order to illustrate ways to enhance the beneficial and reduce the detrimental effects of vegetation management re-directions on water and herbage production. Seven vegetation zones are considered distinguishable for characterizing and describing water yield improvements and include mixed conifer forests, ponderosa pine forests, pinyon-juniper woodlands, chaparral vegetation zone, grassland vegetation zone, desert shrub vegetation zone, and riparian association zone. The vegetation management re-directions evaluated have potential for increased water and herbage production while reducing detrimental effects of sedimentation and erosion. It seems possible that vegetation management systems can be aimed at satisfying increasing demands for water and herbage production and also minimize the destruction of on-site resources. (Robinett-Arizona)

CASCADE ATMOSPHERIC WATER RESOURCES PROGRAM, VOLUME I,
Washington State Dept. of Ecology, Olympia.
P. V. Hobbs, L. F. Radke, A. B. Fraser, J. D. Locatelli, and C. E. Robertson.
Report No. VI, May 1, 1975, 306 p. 14-06-D-6999

Descriptors: *Artificial seeding, Mountains,Storms, Orographic clouds, Precipitation(Atmospheric), Snowfall, *Weather modification *Washington, *Cyclones, *Cloud seeding.
Identifiers: *Cascade Mountains(Wash).

Studies of winter cyclonic storms, orographic clouds, and precipitation over the Cascade Mountains of Washiington State are described. During the July 1970-June 1971 period simultaneous airborne, ground and radar observations were made in a number of different synoptic situations, and investigations into the effects on clouds and precipitation of seeding with artificical ice nuclei were continued. Progress was also made in developing a theoretical model to describe the flow of air over the Cascade Mountains and the growth and fall-out of precipitation from orographic clouds. EFFECTS OF CLOUD SEEDING ON SUMMERTIME PRECIPITATION IN NORTH DAKOTA,
South Dakota School of Mines and Technology, Rapid City, Inst. of Atmospheric Sciences.
A. S. Dennis, J. R. Miller Jr, E. I. Boyd, and D. E. Cain.
Report 75-1, March 1975. 14-06-D-6660

Descriptors: Cloud physics, *Cloud seeding, Clouds, Hail, Ice nuclei, *North Dakota, Radar, Rainfall, Silver iodide, Statistics, *Weather modification, Monte Carlo method, *Precipitation(Atmospheric).

A randomized pilot project was conducted from 1969 to 1972 to test effects of cloud seeding upon growing season precipitation in western North Dakota. The principal seeding method was the operation of silver iodide generators on aircraft below cloud base. Data were collected by radar, instrumented aircraft, rain gages, and passive hail indicators. The analysis provides evidence, significant at roughly the 5% level, that silver iodide seeding of convective clouds on a determinate set of days leads to (1) an increase in the frequency of rainfall events at the target gages, (2) an increase

in the average rainfall recorded per rainfall event, and (3) an increase in total rainfall on the target. The set of days to which this evidence applies is those days with dynamic seedability, that is, days for which a cloud model predicted an increase in cloud top height under the influence of silver iodide seeding. Rainfall observations on days when the cloud model predicted no increase in cloud height show no significant differences between seed and no-seed days. The hailfall data show less hail on seed than on no-seed days but the difference is not statistically significant. (Bureau of Reclamation)

THE POTENTIAL FOR RAINFALL INCREASES FROM CONVECTIVE CLOUDS IN THE NORTHERN PLAINS,
South Dakota School of Mines and Technology, Rapid City. Inst. of Atmospheric Sciences.
A. S. Dennis, J. H. Hirsch, D. E. Cain, J. R. Miller, Jr., and A. Koscielski.
Report 75-12, September 1975. 14-06-D-6796

Descriptors: *Model studies, Cloud physics, *Cloud seeding, Cumulus clouds, Radar, Rain, Rain gages, Silver iodide, Statistical analysis, Monte Carlo method, *Weather modification, Precipitation(Atmospheric), *North Dakota, Rainfall.
Identifiers: Northern Plains(No Dak).

Investigations using data collected during field experiments in cloud seeding over the past ten years are escribed. The sets of data used are the Cloud Catcher 10-cm radar for 1971-72, the rainfall records from the Rapid Project of 1966-68, and from the North Dakota Pilot Project (NDPP) for 1971-72, and time-lapse radar photographs obtained on the NDPP in 1972. A one-dimensional, steady-state cloud model has been used extensively in all three investigations. The 10-cm radar data from Project Cloud Catcher are analyzed for the first time in terms of individual cells rather than test cases as a whole. The Cloud Catcher cases of 1971-72 were randomly assigned to seed and no-seed categories with salt being the usual seeding agent. A comparison of 41 cells drawn from the seed population and 16 drawn from the no-seed population shows no difference in cloud depth but suggests significant differences in some other variables. The Rapid Project was a randomized crossover experiment with separate target areas for southwest and northwest flow days. Consideration was given to average daily rainfall in each target area. A study of shower echoes on the North Dakota Pilot Project for 1972 shows most of the cloud depths from 4 to 10 km. Cloud model runs suggest considerable dynamic seedability for clouds 3 to 6 km deep. (Bureau of Reclamation)

CLOUD SEEDING TO ENHANCE SUMMER RAINFALL IN THE NORTHERN PLAINS,
South Dakota School of Mines and Technology, Rapid City. Inst. of Atmospheric Sciences.
A. S. Dennis, P. L. Smith, Jr., B. L. Davis, H. D. Orville, and R. A. Schleusener.
Report No. 74-10, (1974).

Descriptors: Convection clouds, Cloud physics, *Cloud seeding, Computer models, *Cumulus clouds, Hail, Ice nuclei, Nucleation, Silver iodide, *Weather modification, *South Dakota, Water yield improvement.
Identifiers: *Northern Great Plains(So Dak).

Convective clouds are controlled by moisture supply, atmospheric instability, topographic features, and the convergence or divergence in the low level wind field. Precipitation forms in convective clouds through both the coalescence of liquid droplets and the action of frozen precipitation embryos. Both precipitation processes can be induced or modified by artificial means, the coalescence process by hygroscopic seeding, and the ice phase process by introduction of dry ice or silver iodide crystals to the supercooled portions of the cloud. Silver iodide seeding from aircraft in updrafts below cloud base using acetone generators charged with a silver iodide-ammonium iodide solution is recommended as an effective and relatively economical seeding method. Both salt and silver iodide seeding increase the horizontal extent of showers and total rainfall from them. Rainfall increases by silver iodide seeding include a component related to dynamic effects caused by the release of latent heat by artificial freezing of supercooled cloud water. (Bureau of Reclamation)

SATELLITE SUPPORT TO THE HIPLEX ACTIVITIES FOR 1975,
Colorado State Univ., Fort Collins. Dept. of Atmospheric Science.
D. W. Reynolds, T. H. Vonder Haar, J. J. Gailium, and D. W. Hillger.
Final report, December 1975. 137 p, 62 fig, 9 tab, 20 ref. USBR 14-06-D-7630.

Descriptors: Satellites(Artificial), *Weather modification, Climatology, *Kansas, *Remote sensing, *Clouds, *Climatic data, Data collections, Precipitation(Atmospheric).
Identifiers: Miles City(Kan), Colby-Goodland(Kan), Big Spring(Kan).

Final results of a cloud climatology composite developed using ATS-3 satellite imagery for three HIPLEX sites (Miles City, Colby-Goodland, Big Spring) are presented. Case study results demonstrate the usefulness of satellite data in determining cloud heights, organization, life time compared to radar, size compared to echo size, and show how satellite sounder data can extend conventional radio-sonde data in both space and time. Three years of ATS-3 satellite data were also examined and a subjective classification of mesoscale and synoptic weather features were compiled for the three HIPLEX sites and the northern, central and southern high plains. Also, five years of WBAN-10 hourly observations were analyzed and a climatological composite of both convective cloud and precipitation occurrences were compiled. These results are a preliminary look into how satellites can support the HIPLEX experiment. Digital and imagery data gathered from the SMS-2 satellite should increase knowledge of how satellites can support the HIPLEX. (Bureau of Reclamation)

ECOLOGICAL EFFECTS OF WEATHER MODIFICATION: EFFECT OF LATE SNOWMELT ON FESTUCA IDAHOENSIS ELMER MEADOWS,
Montana State Univ., Bozeman. Dept. of Biology.
T. Weaver.
Am Midl Nat. 92(2), p346-356, 1974.

Descriptors: Ecology, Environmental effects, *Fescues, *Snowmelt, *Grasslands, *Weather modification, Ground cover, Seasonal, Soils.
Identifiers: Festuca-Idahoensis.

Diversity, cover and productivity of F. idahoensis meadows become progressively lower as one moves; from deep-soil to shallow-soil sites, or from sites that melt out in mid-May to sites that melt in late May or early June. Changes in species composition are also obvious on late melting sites. Changes associated with different melt dates are probably due to the shorter growing season of the late melting sites. Winter weather modification programs are expected to add snow, postpone melt, shorten the growing season and degrade these meadows in proportion to the amount of snow they add. Especially if the snow is deposited in drifts, the 10-15% increases in snowfall probably achievable will have small effects on the 'target area' while returns to the 'service area' might be considerable. --Copyright 1975, Biological Abstracts, Inc.

3C. Use Of Water Of Impaired Quality

SEED GERMINATION, RESPIRATION AND MITOCHONDRIAL EFFICIENCY OF THREE ALFALFA (MEDICAGO SATIVA L.) CULTIVARS SUBJECTED TO NACL SALINITY,
Arizona Univ., Tucson. Dept. of Agronomy and Plant Genetics.
M. Bar-Adon.

Descriptors: *Alfalfa, *Germination, *Respiration, *Salt tolerance, *Plant physiology, Seeds, Salinity, Water quality, Salts, Saline soils, Arid lands, Crop production, Sodium chloride, Osmotic pressure.
Identifiers: *Mitochondrial efficiency, Ladak 65, Mesa-Sirsa, Salton, Respiratory control.

Salinity is one of the major factors causing yield reduction of agricultural crops in arid and semiarid regions, as low rainfall and high temperatures prevent adequate leaching of soluble salts. The germination percentage, seedling respiration, mitochondrial efficiency and respiratory control of Ladak 65, Mesa-Sirsa, and Salton alfalfa cultivars were evaluated under water potentials ranging from 0 to minus 10 bars. With increasing salt concentration, germination percentage of the three cultivars decreased; Salton had the greatest tolerance. NaCl salinity exerted both osmotic and toxic effects on the germinating seed. The highest respiration rates averaged over all salt concentrations were noted in Mesa-Sirsa which showed an increase in respiration rate when treated with minus 10 bars sodium chloride. Mitochondrial efficiency and respiratory control were polarographically measured from isolated mitochondria. At high salt concentrations both mitochondrial efficiency and respiratory control were higher than at low salt concentrations, with Ladak 65 having the highest mitochondrial efficiency and respiratory control followed by Mesa-Sirsa and Salton respectively. (Robinett-Arizona)

SALINITY-OZONE INTERACTIVE EFFECTS ON ALFALFA YIELD AND WATER RELATIONS,
Agricultural Research Service, Riverside, Calif. Salinity Lab.
G. J. Hoffman, E. V. Maas, and S. L. Rawlins.
Journal of Environmental Quality, Vol. 4, No. 3, p 326-331, July - September, 1975. 4 fig, 5 tab, 16 ref.

Descriptors: *Salinity, *Ozone, *Soil-water-plant relationships, *Alfalfa, Irrigation water, Saline water, *Crop production, Plant growth, Agriculture, Air pollution, Leaves.
Identifiers: Medicago sativa L. cv. Moapa, Leaf diffusion resistance.

The effect of ozone on forage yield of alfalfa (Medicago sativa L. cv. Moapa) was determined at four controlled salinity levels (NaCl and CaCl2)

having osmotic potentials of -40, -200, -400, and -600 kilopascals. For nonsaline treatments, ozone greately reduced yields when alfalfa was exposed to daily 2-hour periods of 10-20 parts per hundred million; concentrations that are prevalent in many agricultural areas. As salinity increased, ozone had less effect on yield, and a 25% greater yield was produced with salinity at moderate, but not detrimental levels. Salinity at all levels or ozone at 20 parts per hundred million increased water use efficiency of alfalfa, and low concentrations of ozone had no effect on water-use efficiency. Both ozone and salinity together were required to increase leaf diffusion resistance. (Robinett-Arizona)

EFFECT OF SALINE WATER IRRIGATION ON N.CO310 AND H50-7209 CULTIVARS OF SUGARCANE: II. CHEMICAL COMPOSITION OF PLANTS,
Hawaii Univ., Honolulu. Dept. of Agronomy and Soil Science.
M. M. Syed, and S. A. El-Swaify.
Trop Agric. 50(1), p 45-51, 1973.

Descriptors: *Sugarcane, *Saline water, Irrigation, Chlorides, Sea water, Sulfates, Sodium chloride, Sodium sulfate, Phosphorus, Potassium, Magnesium.
Identifiers: Cultivars, H50-7209, Sodium.

The effects of saline water irrigation on the chemical composition of 2 sugarcane cultivars were determined. Salt types NaCl, Na2SO4 and sea water affected the uptake of various elements differently. In general, the Na content was increased by all treatments, K content remained unchanged with NaCl and sea-water irrigation but decreased with Na2SO4, Ca content was reduced, most of the reduction occurring under Na2SO4 irrigation, and Mg content increased slightly with the highest content noted under sea water treatments. Analysis for anions showed that Cl content increased significantly with NaCl and sea water irrigation but decreased sharply with Na2SO4, that the converse was true for SO42- content, that P content remained essentially unchanged for N.Co.310 but increased significantly for H50-7209, and that N contents of blades were reduced under all treatments.--Copyright 1975, Biological Abstracts, Inc.

SEEDBED SOIL SALINITY AND EMERGENCE OF PEPPERS AND CARROTS UNDER SPRINKLER AND FURROW IRRIGATION,
Agricultural Research Service, Weslaco, Tex.
F. Salinas, and L. N. Namken.
J Rio Grande Val Hortic Soc. 27, p 74-80, 1973.

Descriptors: *Saline soils, *Carrots, *Sprinkler irrigation, *Furrow irrigation, Irrigation practices.
Identifiers: *Peppers.

Seedbed soil salinity levels were affected by irrigation method during the establishment of sweet peppers and carrots. Soil salinity (ECE) in the surface 2.5 cm increased from 0.6 to 11.4 mmho/cm during the summer establishment of peppers under furrow irrigation compared with an increase from 0.6 to 3.5 mmho/cm under sprinkler irrigation. Soil salinity below 2.5 cm was the same for both irrigation methods. Sweet pepper populations before thinning were 170,000, 277,000 and 412,000 plants/ha under furrow, 3-5 day sprinkler and daily sprinkler irrigation treatments, respectively. The ECE in the surface 2.5 cm of the beds after the establishment of fall carrots under furrow irrigation was 12.3 mmho/cm compared with 5.7 mmho/cm under sprinklers. Carrot populations after stand establishment irrigation were 250,000 and 288,000 plants/ha under furrow and sprinkler irrigation, respectively. --Copyright 1974, Biological Abstracts, Inc.

CHEMICAL COMPOSITION AND YIELD OF SOYBEANS AS AFFECTED BY IRRIGATION AND DEEP PLACEMENT OF LIME, PHOSPHORUS AND POTASSIUM,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Coll. of Agriculture.
J. A. Lutz, Jr., G. D. Jones, and E. B. Hale.
J Indian Soc Soil Sci. 21(4), p 475-483, 1973.

Descriptors: *Soybeans, Crop production, *Lime, *Phosphorus, *Potassium, Fertilizers, Irrigation.

The experiment conducted on Davidson clay loam consisted of treatment of 49 kg P/ha and 186 kg K/ha disked into the Ap layer in 1969 and 1970. Plow sole placement (30.5 cm) consisted of various rates and ratios of P and K with and without lime and micronutrients. Deep placement of lime and fertilizer did not affect the yield and quality of soybeans (Glycine max (L.) Merrill). Irrigation increased lodging, delayed maturity and significantly increased the yield of beans and hay each year. Leaf P and K, and the protein contents of beans were unaffected by irrigation. Oil content of beans was increased significantly with irrigation. Irrigation also significantly increased seed size and purple stain. The soil pH and available P, K, Ca and Mg of various soil depths were affected by lime, P and K treatments.--Copyright 1974, Biological Abstracts, Inc.

A PROPOSAL FOR FUTURE UTILIZATION OF THARTHAR LAKE WATER,
Institute for Applied Research on Natural Resource, Baghdad (Iraq).
N. M. Ali Rashid, A. H. Al-Rawi, G. S. Toma, and R. K. Abdul-Halim.
Technical Bulletin 74, October 1974. 35 p, 4 fig, 11 tab, 14 ref.

Descriptors: *Saline water, *Irrigation water, *Water supply, *Water quality, Brackish water, Irrigation, Salinity, Water demand, Dams, Storage requirements, Water resources development, Water shortage.
Identifiers: *Tharthar Lake(Iraq), *Euphrates River, Tigris River, Habbaniya Lake(Iraq).

Construction of dams on the Euphrates river in Turkey and Syria has not only caused water shortages in the Euphrates river in Iraq, but has also increased the river's salinity. The use of Tharthar lake water, which is highly saline, has therefore become valuable for augmenting irrigation water in the central and southern parts of Iraq. However, in order to reduce the salinity hazard it was necessary to find the most suitable mixing ratio of Tharthar and Euphrates water. With respect to salinity and sulfate ion concentration, a mixing ratio of 0.25:1.00 of Tharthar to Euphrates water appears to be most suitable. Using this ratio about 6.442 billion cu m per year could be released from the lake to the Euphrates river. For flood control and during the period of October-February when irrigation demands are low, a higher mixing ratio of 0.5:1.0 is suggested. Results of chemical analysis of waters from the Tigris and Euphrates rivers and Tharthar and Habbaniya lakes indicate that water of the Tigris river has the best quality with respect to salt content, carbonates, sulfate content, and sodium adsorption ratio, followed by Habbaniya, Euphrates, and Tharthar waters. The sulfate concentration in Tharthar lake amounted to about 45 percent of the total ionic concentration. (Robinett-Arizona)

DRAINAGE AND RECLAMATION PERFORMANCE AT THE IMAM EXPERIMENTAL FIELD IN THE GREATER MUSSAYEB PROJECT, A MONITORING STUDY,
Institute for Applied Research on Natural Resources, Baghdad(Iraq).
B. A. Takessian, and R. van Aart.
Technical Bulletin 79, December, 1974. 15 p, 5 fig, 3 tab, 4 ref.

Descriptors: *Drainage engineering, *Irrigation effects, *Land reclamation, *Hydraulic conductivity, *Drainage systems, Soil-water-plant relationships, Soil moisture, Drainage practices, Arid lands, Infiltration, Soil investigations, Land management, Permeability, Irrigated land, Soil physical properties, Saturated soils.
Identifiers: *Greater Mussayeb Project(Iraq).

The Greater Mussayeb Project is located about 65 km south of Baghdad and consists of some 80,000 hectares irrigated with Euphrates River water. In order to test the existing drainage systems with drain spacing of 333 m under improved farm conditions, a farm unit of 16.5 hectares, situated in a

transition zone between high levee and basin soil associations, was monitored for 3 years (1969-1972). Results indicated that under an average cropping pattern of 50 percent winter and 45 percent summer intensity the existing open drainage system was adequate to prevent water-logging and salinization of the land. Hydraulic conductivity measurements showed that to a depth of 3.5 m the soil is moderately to moderately rapid permeable with values ranging from 0.6 to 3.5 m/day and with an average of 1.5 m/day. Below 3.5 m the average permeability can be taken as 0.4 m/day. The average drainage requirement was calculated at 0.8 mm/day and the effective transmissibility was 20 sq m/day. (Robinett-Arizona)

Descriptors: *Salts, Corn(Field), *Roots, Plant physiology, Salt tolerance.

Reduction of water potential by physiologically high concentrations of salt or osmotica results in an increase of endogenous osmotic potential of the root cells (Zea Mays.). This increase is due to increased ion concentration, whereas the sugar concentration decreases. Long-distance transport of assimilate is impeded by a long term incubation of the roots in salt water.--Copyright 1975, Biological Abstracts, Inc.

WASTEWATER FLOW REDUCTION IN THE HOME,
Enviro Control, Inc., Rockville, Md.
A. Hershaft.
Journal Environmental Systems, Vol. 4, No. 3, p 217-239, Fall 1974. 3 fig, 5 tab, 51 ref.

Descriptors: *Water pollution control, *Water conservation, *Water utilization, *Recycling, Water allocation(Policy), Water supply, Water policy, Reclaimed water.
Identifiers: Household water use, Waste water flow reduction.

Of the average per capita water demand of 150 gallons per day in the US, 60 gallons are used for residential purposes, 50 in industry, 20 in commercial applications, 10 for public purposes and 10 unaccounted, not including irrigation and outdoor recreation. In order to meet the zero discharge goal of the Federal Water Pollution Act of 1972 residential water use is a prime target for conservation measures. Studies indicate that household water use can be reduced by 35% with available technology and that there is general public acceptance of devices. There are many inexpensive flow reduction devices usable on toilets. Another approach is in-house recycling of used water for a less exacting use on the theory that water quality need only be sufficient for the intended purpose. For example, laundry wastewater can be used for flushing toilets and watering lawns with some treatment for foam, suspended solids and other contaminants. Many suggestions for saving water, including ponding water for general cleaning rather than letting the spigot run, sharing a bath or shower with another family member, lowering the water level in the toilet tank by adjusting the float, etc. Education is the key to effecting savings and demonstration programs in particular are useful. Principal benefits are decreased demand for water treatment, wastewater treatment, sewer capacity, and energy generation. Costs incurred are in promotion, acquisition, installation, and operation of equipment. There may also be some loss of conveniences and freedom of action. Despite general public acceptance of water conservation in concept, there needs to be strong incentive on the part of government to overcome resistance to actually installing and using devices to reduce water use. (Smith - North Carolina)

WATER-SAVING DEVICES: THE STATE OF THE ART,
Pennsylvania State Univ., University Park. School of Forest Resources.
W. E. Sharpe, and P. W. Fletcher.
DE/Journal, p 11-13, 15, October, 1975. 2 fig, 5 ref.

Descriptors: *Water conservation, Energy, Costs, Sewage, Water utilization, Efficiencies, Wastes, Reviews.
Identifiers: *Water saving devices, Energy consumption, Water heating, Waste flow.

Predictions of water needs are in need of revision because of the change in the country's energy needs. Water conservation must be practiced to alleviate this problem as well as the unnecessary treatment of large amounts of waste. Methods of water conservation, such as new pricing, universal metering, and public education, are generally only temporary solutions. Water saving devices can accomplish the same goals cheaply and without major disruptions in water use habits. The impact and cost effectiveness of various water saving devices are discussed. Studies have shown that water use reductions on the order of 20% resulted when devices were installed on resident owned dwellings. Reductions were insignificant where tenant landlord situations prevailed and in commercial establishments. Waste flow reduction efforts on infiltration-inflow correction can account for more than 30 to 40% of the sewage flow reaching the treatment plant. For on-lot sewage disposal systems, water saving devices can produce a 40% reduction in sewage flows. A 26% reduction was found when a waste water recycling system was used with septic tanks. A study showed that an estimated 560,000 barrels of oil could be saved daily with the efficient use of hot water. The increased concentrations of solids that would result from waste flow reductions could have an adverse effect on sewage systems that are designed to carry small loads, but generally this problem is thought to be insignificant. Studies have shown that water saving devices such as shower flow controls, and toilet inserts are cost effective on new and old homes. A limitation is their availability. (Pinto-FIRL)

GEOTHERMAL POWER SYSTEM AND METHOD,
J. S. Swearingen.
U.S. Patent No. 3,935,102, 5 p, 3 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 942, No 4, p 1873-1874, January 27, 1976.

Descriptors: *Patents, *Geothermal studies, *Heat flow, *Thermal conductivity, *Thermal water, Temperature, Scaling, Heat transfer, Porous media, Gravels, Heat exchangers, Water reuse.

A heat transfer medium in the form of a housing containing porous material such as a bed of gravel or other granular material is used to transfer heat from the unrefined water to clean water which is then passed through the heat exchanger. The hot unrefined water does not come in contact with the heat exchanger thus avoiding the problem of scaling or corrosion on the surfaces of the heat exchanger. In the system a volume of the hot unrefined water is passed through a housing containing porous material which pick up the heat of the water. A volume of clean water is then passed through the housing to pick up the heat from the porous material. The now heated clean water can then be passed through a heat exchanger without significant danger to the surfaces of the exchanger. The clean water can be recycled through the system many times, each time passing through the housing immediately after a volume of the unrefined water. The source of the clean water may be the unrefined water whih has been passed through the porous material. After being removed from the housing, the cooled unrefined water is delivered to a detention receptacle. Here it attains stabilization through elimination of its supersaturation and many of the impurities precipitate to the bottom of the receptacle. The liquid which is left on the top of the receptacle is substantially free of impurities to the extent that what impurities are left in the liquid are not sufficient to unduly damage the surfaces of the heat exchanger. U.S. Patent No. 3,935,109, 3 p, 2 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 942, No 4, p 1877, January 27, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Recycling, *Filtration, Pulp and paper industry, *Pulp wastes, Fibers(Plant), Water reuse, Recirculated water, *Separation techniques, Filters.
Identifiers: Strainers(Filters).

A straining apparatus separates the fibers from the backwater coming from a paper making machine so that the water can be re-used as spray-water. The apparatus consists of a funnel-shaped vessel with an outlet. A first strainer forms one wall of the vessel. Fiber containing liquid is sprayed on the outside of the strainer wall. A second strainer having a smaller total area covers the outlet of the vessel and is situated lower than the first strainer wall. During operation a liquid column is maintained on the inlet side of the second strainer and a free liquid surface is formed between the two strainers. The mesh openings of the second strainer are larger than the mesh openings of the first strainer but small enough so that any fibers passing through the first strainer due to rupture will obstruct the second strainer. NORTHERN GREAT PLAINS RESOURCE PROGRAM, WATER WORK GROUP REPORT.
Northern Great Plains Resources Program, Denver, Colo.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 150, $10.00 in paper copy, $2.25 in microfiche. Reports No. NGPRP/CD-74-200, NGPRP/CD-74-201, NGPRP/CD-74-202, NGPRP/CD-74-203, December 1974. 333 p. 19 fig., 83 tab., 4 append.

Descriptors: *Water resources, *Great Plains, *Water resources development, *Industrial water, Montana, North Dakota, South Dakota, Wyoming, Nebraska, Institutional constraints, Fossil fuels, Water utilization, Surface waters, Groundwater, Interstate compacts, Water rights, Water supply, Streamflow, Recreation, Wild rivers, Alternative planning, Competing uses, Indian reservations, Beneficial use, Strip mines, Consumptive use, Water costs.
Identifiers: *Northern Great Plains, *Coal gasification, Water pollution potential.

The surface water of the Upper Missouri River Main Stem and the Yellowstone Basins, and the groundwater resources in Montana and Wyoming, are analyzed in relation to the development of coal resources. The constraints to water resources development are discussed with particular reference to state water laws, policies, administration, and interstate compacts. Also considered are federal constitutional and statutory provisions, and Indian water rights. The potential for water resources development is based on availability and uses by coal-fired powerplants and coal gasification plants. Alternative plans for water supply for coal development are projected at a base level, most probable level, and extensive level, and include considerations of availability and cost of groundwater. Impacts of water use for coal development at the projected levels as related to reservoir operation, streamflow, navigation, recreation, fisheries, and water quality are evaluated as are the effects of strip mining on groundwater. The costs of storage and water transmission facilities are estimated for powerplants and gasification plants in North Dakota, Montana, and Wyoming. The recreation and aesthetic value of the rivers in the region are described and what constraints should be imposed on the existing and proposed mineral and industrial development in order to maintain their quality are detailed. Descriptors: *Irrigation Practices, Distribution Systems, Sprinkler Irrigation, Furrow Irrigation, Border Irrigation, *Irrigation Efficiency, Economics, *Replacement Costs, Irrigation districts, *Idaho, *Water management(Applied), *Rehabilitation.
Identifiers: Jefferson County(Idaho), North Rigby Irrigation District(Idaho), Snake River Fan(Idaho).

High water tables caused by overuse of irrigation water have created physical and socioeconomic problems in some areas of southeastern Idaho. In one area, the Snake River Fan of Jefferson County, the irrigation systems and management practices were investigated to determine their contribution to the high water table problem. The investigations showed that the present systems are quite inefficient due to soils with high water intake rates, long irrigation runs and duplication of many irrigation canals. Engineering and economic analyses were made to determine the least cost method of rehabilitating the present system and to determine the capability of the area to support various rehabilitation schemes. Both analyses utilized linear programming models to determine optimum solutions subject to various social and legal constraints. The results obtained indicate that present practices are the most economical for the present cost and availability of water. Wells equipped with high head pumps supplying sprinkler systems appear to be the best alternative if a marked increase in overall irrigation efficiency is to be achieved. Farm sizes of 160 acres or more would be necessary to produce enough net income to support any major rehabilitation scheme.

EFFECTS OF FERTILIZATION AND IRRIGATION ON YIELD AND POTASSIUM CONTENT OF ALFALFA AND ON AVAILABLE SOIL POTASSIUM,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agronomy.
G. D. Jones, J. A. Lutz, Jr., and E. B. Hale.
Commun Soil Sci Plant Anal. 5(3): 155-163. Illus. 1974. (In Engl. with Engl. summ.).

Descriptors: *Alfalfa, *Fertilization, *Effects, *Nutrient requirements, *Irrigation effects, *Plant growth, *Potassium, Soil chemistry, Crop production, Crops, Field crops.
Identifiers: Medicago-Sativa.

Alfalfa (Medicago sativa) yields were determined for 5 yr on Davidson clay loam at Orange, Virginia. The effects of irrigation and K application on the yield and chemical composition of alfalfa and on the available soil K content were determined. Seven rates of K were applied annually. The available K content of the 0-15 cm soil depth gradually decreased on irrigated and non-irrigated plots when 0, 93 and 186 kg K/ha were applied. Available soil K increased over 100% when 556 kg K/ha was applied. Possibly because of leaching, the decrease in available soil K in the 0-15-cm depth of plots treated with 0 and 93 kg K/hawas sligtly greater on irrigated than on non-irrigated plots. Where K was applied, considerably more available Kwas presented in 1973 in the profile of irrigated plots than in non-irrigated plots. The K concentration of the alfalfa was unaffected by irrigation but was increased with added K during the last 3 yr. Alfalfa yields were increased each year with irrigation but there was no response to K fertilization.--Copyright 1975, Biological Abstracts, Inc.

EFFECT OF IRRIGATION REGIMES IN RELATION TO CHLORCHOLINE CHLORIDE (CCC) APPLICATION ON WHEAT,
Cairo Univ., Giza (Egypt). Dept. of Agronomy; and Cairo Univ., Giza (Egypt). Faculty of Agriculture.
A. H. El-Hattab, and A. F. Ibrahim.
Z Acker- Pflanzenbau. 139(1), p 71-81, 1974.

Descriptors: *Irrigation practices, *Wheat, Chlorides, Spraying, Crop production, Crop response, Fertilizers.
Identifiers: *Chlorocholine chloride, Spikes.

The application of irrigation regimes (number and time), CCC spraying at different growth stages of wheat cultivar 'Giza 155,' and their interaction under 60 kg N/feddan was investigated in both 1971 and 1972 seasons. Increasing the number of waterings (6 times) induced elongation of plant height, leading to lodging of wheat plants compared to 3 and 4 irrigations. Number of tillers and spikes per plant were not generally affected by the various irrigation regimes. The total yield, straw and grain was rather high under 6 waterings in both seasons. However, the grain yield under 3 times of irrigation in 1972 showed an obvious increase over the other 2 regimes. With regard to CCC-treatments, a reduction in stem height was observed when CCC was sprayed either at the 8-leaf stage or after primordial initiation in 1972 season. In addition, an obvious increase in grain yield was obtained in 1972 under all CCC-times of application, particularly when it was applied after primordial initiation. Concerning the interaction between watering regimes and CCC-time of application, CCC generally reduced stem height especially under average moisture conditions when it was sprayed after primordial initiation. Accordingly, an increase in lodging resistance of the CCC-treated plants under all water regimes was recorded. Moreover, grain yield increased when CCC was sprayed after primordial initiation under water stress. This increase was linked by an increase in number of tillers and spikes per plant, 1000 grain weight and the degree of lodging resistance.--Copyright 1974, Biological Abstracts, Inc.

WATER USE, ENERGY BALANCE AND GROWTH OF MAIZE AT SAMARU, NORTHERN NIGERIA,
Institute for Agricultural Research, Zaria (Nigeria).
J. M. Kowal, and A. H. Kassam.
Agric Meteorol. 12(3), p 391-406, 1973.

Descriptors: *Water utilization, *Energy, *Corn(Field), Africa, Growth rates, Transpiration, Soils, Crop production, Climates.
Identifiers: *Nigeria, Samaru.

Energy and water budget of maize crop grown in a dry sub-humid climate of northern Nigeria were assessed and related to crop performance. The pattern of crop water requirement during the growing season was well matched to the pattern of crop water availability. The period of maximum water requirement by the crop occurred when the leaf area index was greater than 2.1 and coincided with the period when the amount and frequency of rainfall was greatest. However, under the prevailing climatic conditions, with potential evapotranspiration rates of 4-6 mm per day, the crop may experience water stress, if there is no rain for a period of 5 days or more. The rate of crop growth was drastically reduced when soil-water potential decreased below -0.5 bar. The total water used by the crop during 117 days from sowing to harvest was 486 mm, of which 345 mm transpired through the plants. Crop water use efficiency was 353 g of water per g of dry matter. The crop yielded 7284 kg ha-1 of grain and 19,180 kg ha-1 of total dry matter. The efficiency of energy conversion for the season was 1.4% of the total incident radiation, while during the period of active growth the energy conversion was 2.4%.--Copyright 1974, Biological Abstracts, Inc.

Agricultural Research and Education Center, Lake Alfred, Fla.
R. C. J. Koo, T. W. Young, R. L. Reese, and J. W. Kesterson.
J Am Soc Horti Sci. 99(4), p 289-291, 1974.

Descriptors: *Nitrogen, *Potassium, Irrigation practices, Citrus fruits, *Lemons, Crop production.

Yields and quality were compared on young bearing 'Bearss' lemon (Citrus limon L.) trees grown with 3 rates of N and K and 2 levels of soil moisture over a 4-yr period. Increased rates of N application increased fruit production, incidence of fruit with scab, and green fruit; and decreased acid content of juice. K applications increased the acid content of juice. Irrigation increased fruit size and decreased the number of green fruit after curing. A leaf N content of 2.2-2.6% is suggested for optimum fruit production for 'Bearss' lemon under Florida conditions.--Copyright 1974, Biological Abstracts, Inc.

ANTI-RUN AHEAD SYSTEM FOR TRAVELING HOSE PULL SPRINKLERS,
Heinzman Engineering, Inc., Grand Island, Nebr. (Assignee).
J. C. Groelz, and J. W. Heinzman.
U.S. Patent No. 3,934,819, 4 p, 4 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 942, No. 4, p 1788, January 27, 1976.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation systems, *Irrigation practices, Lateral conveyance structures, Application equipment.
Identifiers: Mobile irrigation devices, Brakes.

Some mobile irrigation devices utilize large capacity high pressure irrigation guns which oscillate and are rearwardly directed and at the start of a run of the mobile irrigation device along a field the reactionary forces applied to the sprinkler as a result of the rearward discharge of irrigation water tends to overcome rolling resistance of the wheels and the frictional drag of the initial short length of hose being dragged behind the irrigation device with the result that the device tends to move along the field at a rate faster than that which would be determined by the cable being wound on the winch. The mobile irrigation device of this invention is equipped with a chain drive for driving the winding drum for the cable along which the irrigation device pulls itself. The wheels of the device are provided with fluid pressure actuated brakes and tension sensing structure is provided for sensing the taut reach of the driving chain and connected to a control valve interposed in a high pressure fluid line extending from the high pressure irrigation water supply to the brake actuator. Thus, should the tension of the taut reach of the driving chain be reduced below a predetermined minimum the brakes of the mobile irrigation device are applied to prevent a 'run ahead' condition. (Sinha - OEIS)

SPRINKLER CONTROL,
Telsco Industries, Dallas, Tex. (Assignee).
C. W. Phaup.
U.S. Patent No. 3,934,820, 8 p, 7 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 942, No 4, p 1788, January 27, 1976.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation systems, *Irrigation efficiency, Irrigation practices, Application equipment.
Identifiers: Pop-up sprinklers.

A pop-up sprinkler system protected from accumulation of debris, from interference with adjustable controls, and from operational difficulties caused by complicated mechanisms and unregulated pressure heads is described. The invention comprises an outer housing, a rotatable nozzle head vertically movable through an outer housing cover, and an inner housing attached to the nozzle head and slidably received within the outer housing. Enclosed within the inner housing is an impeller driven transmission with a speed-reducing gear train isolated from the flow of water, a manually adjustable by-pass throttle to control the flow velocity of water driving a water-wheel impeller, and an accurate and greatly simplified direction controlling mechanism to control the location and size of an arc sector over which water is to be discharged. As the inner housing is accessible only when the sprinkler head is inoperative and the outer housing cover has been removed, problems associated with easily accessible adjustment controls are minimized. Under the pressure of water applied to an outer housing water inlet, the nozzle head and inner housing overcome the compressive force of a spring to assume a fully extended position in sealing contact with the outer housing. The flow of water between the water inlet and a drive tube attached to the nozzle head is essentially restriction free to minimize pressure drop across the transmission. (Sinha - OEIS)
W76-06466

IRRIGATION SYSTEM WATER EMITTER,
D. Fitzhugh.
U.S. Patent No. 3,934,824, 4 p, 2 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 942, No 4, p 1789, January 27, 1976.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Irrigation efficiency, Irrigation practices, Application equipment, Distribution systems, Water distribution(Applied).
Identifiers: Drip irrigation, Water emitters.

A water emitter is provided for drip irrigation systems which can be modified at the irrigation site to accommodate variations in pressure in differing areas in the specific configuration or layout of system used, and the typography of the land to be irrigated. The emitter includes a flexible, collapsible thermoplastic or elastomeric emitter tube, having a number of spaced-apart crimps. The crimps serve to close the emitter tube when no water is supplied, and to provide a sinuous path for water, thus increasing friction and controlling pressure at each emitter in the system. The length of each emitter and, therefore, the number of crimps can be selected according to the desired pressure at each emitter site along the system. Also included with each emitter is an elongated, relatively rigid protective tube to prevent soil compaction of the emitter in its collapsed non-functioning state. (Sinha - OEIS)

THE EFFICIENT USE OF UTAH'S IRRIGATION WATER: INCREASED TRANSFERABILITY OF WATER RIGHTS,
Utah Univ., Salt Lake City. Coll. of Law.
M. H. Anderson.
Utah Law Review, Vol. 1975, p. 158-78 Spring 1975. 21 p, 1 dwg.

Descriptors: *Water rights, *Water resources development, *Utah, *Irrigation efficiency, Irrigation practices, *Irrigation programs, Irrigation operation and maintenance, Irrigation engineering, Irrigation design, Irrigated land, Irrigable land, Irrigation districts, Water control, Water districts, Water delivery, Water distribution(Applied), Water allocation(Policy), Water conservation, Water users, Water yield improvement.
Identifiers: *Mutual water companies.

Utah's economic well-being depends upon the adequacy of its water supply. It is essential that existing water supplies be used as efficiently as possible. Irrigation water is almost entirely distributed through organized irrigation entities such as mutual water companies, in which shareholders receive proportionate shares of the corporation's water supply in lieu of dividends, and public agencies, where distribution is either by state irrigation and water conservancy districts or by federal Bureau of Reclaimation contracts. Increased efficiency in water use can be achieved through changes in water resource allocation arising through alteration of existing laws and practices. Enhancing the marketability of irrigation water through suggested changes could provide the needed efficiency. Suggested changes include: (1) state encouragement of mutual water companies; (2) state legislation awarding compensation to water users injured by a proposed water transfer; (3) abolition of mutual water companies' restrictions upon transferability of water among shareholders; and (4) abolition of the required Bureau of Reclaimation's consent to a water transfer when repayment of federal loans have been previously arranged. COSTS ARE SOARING: IRRIGATING FROM THE UNDERGROUND,
Arizona Univ. Tucson. Dept. of Agricultural Economics.
G. S. Willett, and S. Hathorn Jr.
Progressive Agriculture in Arizona, Vol. 27, No. 5, p 1-5, September-October, 1975. 2 tab.

Descriptors: *Arizona, *Pumping, *Irrigation practices, *Electric power costs, *Economic impact, Groundwater mining, *Water costs, Irrigation, Costs, Crop production, Agriculture, Farm prices.

Arizona is the only state that relies totally on irrigation for crop production. Groundwater is used for 52 percent of all harvested cropland in Arizona, and water pumps for irrigation use 13.2 percent of the energy used by agriculture in the state. Depending on the crop grown, as of 1975 energy cost accounts for 18 to 32 percent of the total costs of producing major central Arizona field crops. As pumping costs rise, there will be a drastic change in the method and type of crop production. Improved and efficient irrigation will be more widely practiced and higher value crops will be grown. As it costs more to pump, land value will fall, the number of farm failures will increase, and the trend toward larger and fewer farms will continue. (Robinett-Arizona)

THE ECONOMICS OF CONVERTING NATURAL GAS-POWERED IRRIGATION PUMPS TO ALTERNATE ENERGY SOURCES IN SOUTHEASTERN ARIZONA,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
G. S. Willett, S. Hathorn Jr., C. E. Robertson, and C. G. Page.
Report No. 5, May, 1975. 55 p, 2 fig, 27 tab, 14 ref.

Descriptors: *Economic impact, *Natural gas, *Irrigation, *Alternative costs, *Pumping, *Electric power costs, Water costs, Costs, Construction costs, *Arizona, Irrigation, Groundwater mining, Pumps, Farm prices.
Identifiers: Cochise County(Ariz).

According to current estimates approximately 2,181 pumps in Arizona utilize natural gas engines, representing about 30 percent of the irrigation power units in the state. Use of natural gas for irrigation is particularly important in Cochise County where 1,256 pumps use this fuel. Converting an existing natural gas power plant to electricity will

require an investment between $10,408 and $15,627 and conversion to diesel will cost between $14,333 and $15,520. In terms of added pumping costs, conversion from natural gas to electricity will add $11.50 to $15.50 to the total cost of pumping an acre-foot of water, and conversion to diesel will add an additional $11.71 to $14.99 per acre-foot. EVAPORATIVE COOLING OF 'DELICIOUS' APPLES: THE ECONOMIC FEASIBILITY OF REDUCING ENVIRONMENTAL HEAT STRESS,
North Carolina State Univ., Raleigh. Dept. of Horticultural Science.
C. R. Unrath, and R. E. Sneed.
J Am Soc Hortic Sci. 99(4), p 372-375, 1974.

Descriptors: *Apples, Fruit crops, *Evaporation, Cooling, *Irrigation, Temperature, Feasibility, Economic feasibility, *Thermal stress.
Identifiers: *Evaporative cooling(Fruit).

The response of 'Red Delicious' apples to low volume overtree evaporative cooling (EC) irrigation was studied over a 4-yr period from 1969-72. While the amount of thermal load and irrigation system run-time varied from year to year, EC consistently resulted in fruit temperature averaging 5.6 degrees C (10.1 degrees F) for the entire 509 h the system operated over the 4-year period. In each of the 4 yr, EC improved fruit quality; on the average increasing total reddish color 8%, solid red color 13%, soluble solids 1%, and fruit weight 22-g while reducing corking 8% and bitter pit 7%. The additional fruit coloration stimulated by EC concentration harvest in the earlier portion of the harvest season. During the 4 yr of the experiment, an additional 1/3 of the cooled crop was harvested, with sufficient solid red color to meet 'extra fancy' U.S. grade, during the 1st 2 wk of the seasons. Because of higher early-season prices, the concentrated earlier harvest of EC fruit is of considerable economic benefit. In locations where heat stresses are common, the use of EC and soil irrigation should be economically feasible.--Copyright 1974, Biological Abstracts, Inc.

IRRIGATION OF FIELD TOMATOES AND MEASUREMENT OF SOIL WATER CHANGES BY NEUTRON MODERATION METHODS,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
G. H. Cannell, and C. W. Asbell.
J Am Soc Hortic Sci. 99(4), p 305-308, 1974.

Descriptors: *Irrigation, *Tomatoes, Soil water, Measurement, Soil moisture, Fruit crops, Crop production, Roots.
Identifiers: Lycopersicon-Esculentum, *Neutron moderation methods.

Irrigation studies with processing tomato, Lycopersicon esculentum, cv. VF-145-21-4, showed a highly significant yield increase with increased soil moisture. Total number of fruit (fruit set) was not significantly different with irrigation treatments. Yield differences were largely attributed to small ripe and green fruit, unacceptable for processing, that resulted from soil moisture stress in drier treatments. Soil water volume changes between irrigations were measured in the soil profile using neutron moderation equipment. The total volume of water measured during the season was compared to that applied for each irrigation treatment. With exception of the wet treatment in 1971, agreement between comparisons was within plus or minus 3%. Root growth with depth plotted as a function of time (season) was essentially the same for all irrigation treatments.--Copyright 1974, Biological Abstracts, Inc.

CORRELATION BETWEEN SOWING TIME AND WEATHER FACTORS ON THE INTENSITY OF GROUNDNUT DISEASES,
Agricultural Research Station, Madras (India).
H. D. Lewin, S. Natarajan, and K. Govindarajan.
Indian J Mycol Plant Pathol. 3(1), p26-32, 1973.

Descriptors: *Plant diseases, Crop response, Crop production, Temperature, Weather, Rainfall intensity.
Identifiers: Arachis-Hypogaea, Cercospora-Arachidicola, Cercospora-Personata, *Groundnut diseases.

Early sowings of groundnut (Arachis hypogaea) done at 2-4 wk intervals from 7th June to 22nd July recorded significantly less incidence of 'tikka' disease (Cercospora personata and C. arachidicola) and higher yields. Sowing on 5th Sept. gave the lowest yield and a high incidence of 'tikka'. Both the time of sowing and 'tikka' incidence were negatively correlated with yield. 'Tikka' incidence was positively correlated with rainfall and negatively correlated with temperature. --Copyright 1974, Biological Abstracts, Inc.

ROLE OF BOGS IN THE FORMATION OF SPRING FLOOD RUNOFF LOSSES IN THE DRAINAGE BASINS OF THE NORTHWESTERN EUROPEAN USSR,
O. I. Krestovskiy, and S. B. Dribizova.
Soviet Hydrology, Selected Papers, No. 1, p 43-51, 1974. 3 fig, 4 tab, 12 ref, 1 append. Translated from Trudy Gossudarstvennogo Gidrologicheskogo Instituta, No. 214, p 257-270, 1974.

Descriptors: *Bogs, *Runoff, *Floodwater, *Europe, Saturated soils, Wetlands, Snowmelt, Water storage, Soils.
Identifiers: *USSR, *Spring flood runoff.

The storage capacity of bogs and waterlogged depressions and the dynamics of their storage fluctuations were investigated, and the meltwater losses resulting from the filling of the bogs in spring were determined for the drainage basins of the northwestern European USSR. The amount of water stored in bogs on the date of the end of each spring flood is almost equal to the long-period mean value. There are virtually no spring water losses due to the filling of bogs and only in some years do they reach 10-15 mm with respect to a 20% waterlogged drainage basin. The water absorption capacity of bogs and waterlogged depressions (moisture deficit) is about 100 mm. The moisture deficit in bogs is determined in relation to the long-period mean bog storage on the date of the end of intense spring flood runoff. The value of the moisture deficit is used to compute the possible flood water losses associated with the filling of the bogs. The fluctuations in bog storage are close in magnitude to and synchronous with the fluctuations of the moisture content in the upper 50 cm of the soil. Therefore, in the absence of observations of water levels in bogs, the fluctuations in their storage can be taken into account on the basis of soil moisture observations. (Sims-ISWS)
W76-06175

SOME CHARACTERISTICS OF THE PROCESS OF INCOMPLETE MEANDERING OF THE CHANNEL OF THE UPPER OB' RIVER,
N. M. Kulemina.
Soviet Hydrology, Selected Papers, No. 6, p 518-534, 1973. 3 fig, 5 tab, 7 ref. Translated from Trudy Gossudarstvennogo Gidrologicheskogo Instituta, No. 209, p 4-24, 1973.

Descriptors: *Meanders, *Geomorphology, *Rivers, Erosion, Banks, Braiding, Channels, Flood plains, Stream erosion, Cutoffs, Hydroelectric plants, Bridges, Sedimentation, sediments.
Identifiers: *Ob' River(USSR), *USSR.

An investigation in a reach of the Upper Ob' River of channel and floodplain formation, based on the hydromorphological theory of the channel process, revealed some new patterns of incomplete meandering. The reach with incomplete meandering, i.e., a channel process typical of rivers with severely flooded and relatively easily eroded flood plains, is about 300 km long, starting 60 km upstream of Barnaul city and ending at Kamen'-na-Obi city, where the valley is confined by the outliers of the Salair Ridge. Another type of channel process, the midstream bar or channel braiding process, which gradually changes to incomplete meandering, is developed over a 200-km stretch upstream of the foregoing reach. Groups of meanders with a high degree of development are straightened by a shorter cutoff, whose development is accompanied by an increase in the rates of meandering and by the lengthening of the channel downstream of it. Therefore, 50-60 years later, the decrease in the length and degree of development of meanders in the reach with the cutoff are compensated by the lengthening and an increase in the development of meanders downstream of it. In this case, meanders develop particularly rapidly in the downstream part of the straightening cutoff, where the highest rates of bank movement reach 100 m/yr. (Sims - ISWS)

WATER AS A FOREST PRODUCT,
New Zealand Parks and Reserves, New Plymouth.
A. D. Jellyman.
N Z J For. 18(2), p 211-216, 1973.

Descriptors: Water, Forests, *Forest management, *Land management, Land use, *Water resources, *Water management(Applied).

Land management is a crucial factor in preserving water resources and, since water is a limited resource, it will require good management practices including promotion of methods to reduce loss and wasteful use. Foremost in all future considerations of water development will be the principle of multiple use. For this to be effective, coordination and co-operation of all water users will be required to ensure that the maximum benefits are obtained from any development. The whole concept of present agricultural topdressing programs should be investigated both for economic reasons and to mitigate the problems of nutrient enrichment of waters. There is need for an urgent review of subsidy rates so that more land can be protected for posterity, and there is a need for greater emphasis on the planting of protective and productive forests for sound economic reasons as well as for conservation purposes.--Copyright 1974, Biological Abstracts, Inc.

INVESTIGATIONS OF AQUATIC WEED CONTROL METHODS AND THEIR ENVIRONMENTAL EFFECTS ON NONTARGET AQUATIC SPECIES,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
N. E. Otto.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-240 191, $4.50 papper copy, $2.25 in microfiche. Report No. REC-ERC-74-11, November 1974. 54 p. 9 fig., 13 tab., 31 ref., 2 append.

Descriptors: *Herbicides, *Aquatic weed control, *Effects, *Biological communities, Colorado, Algal control, Diatoms, Invertebrates, Standing crops, Biomass, Irrigation ditches, Canals, Metabolism, Productivity, Copper sulfate, Bioindicators, Performance, Copper compounds, Analytical techniques, Diquat.
Identifiers: Adenosine triphosphate, Monochlorotoluene, Xylene, Acetamide-methylurea compound.

Diatom and macroinvertebrate populations, water quality and biological data, standing crop biomass, and adenosine triphosphate levels were studied in Colorado irrigation ditches. Population data showed few differences between canals treated or untreated with herbicides. Canals treated with copper sulfate-xylene showed species diversity declines but recovered rapidly after treatment stopped. Macroinvertebrates decreased after xylene treatment, returned four days after treatment, and reached previous diversity levels in one month; diatoms recovered more slowly. Relationships between taxa diversity indices and standing crop biomass were more significant for diatoms than macroinvertebrates. Nitrate-nitrogen was higher in canals with weed growth. Taxa type and community structure were indicators of canal-river habitats. Adenosine triphosphate was not a reliable indicator of living biomass; however gravimetric biomass determination may be less sinsitive than metabolic adenosine triphosphate in determining biological productivity. Species diversity indices and chemical and physical water analyses can indicate if pesticides are harming the habitat. Evaluation of an experimental acetamide-methylurea compound and monochlorotoluene indicated that they were herbicidal to pondweeds. A mixture of three soluble copper compounds with diquat had more herbicidal activity than copper sulfate-diquat. Studies of herbicide effects or adenosine triphosphate levels on pondweeds and algae were useful in determining herbicide efficacy. (Buchanan-Davidson--Wisconsin)

ORBITAL AND HIGH ALTITUDE IMAGERY AS A MANAGEMENT TOOL FOR LAND USE AND FLOOD HAZARD STUDIES,
Arizona Univ., Tucson. Office of Arid Land Studies.
R. B. Clark, and D. A. Mouat.
Arizona Water Resources Project Information, Project Bulletin No. 12, December, 1975. 4 p.

Descriptors: *Remote sensing, *Arizona, *Land development, *Flood plain zoning, *Mapping, Land use, Land management, Urbanization, Watersheds(Basins), Flood protection, Environmental effects, Aerial photography, Satellites(Artificial), Terrain analysis.
Identifiers: Apache county(Ariz), Yavapai county(Ariz), Yuma county(Ariz).

In response to the needs of planning within Arizona, the Applied Remote Sensing Program has developed cooperative projects with several user agencies to provide information concerning such problems as flooding and erosion hazards, status of land use, and environmental impacts of proposed or existing modifications of land. Remote sensing techniques provide a rapid and current inventory of subdivisions, as well as a means for monitoring the status of development. Land use inventory projects are currently being undertaken for Apache, Yavapai, and Yuma coun-

ties in Arizona which will use the output in the land regulation process. Areas subject to flooding in Arizona have been interpreted using ERTS-1 multispectral scanner imagery and color infrared photography from the high-altitude aircraft support. These products, in combination with ground checks on sample watersheds, have generated sufficient data for several counties to come into initial compliance with state and federal legislation mandating land use controls within flood-prone areas. Land use data developed can become a base from which county officials can direct the growth of the area in such a way as to maximize the benefit derived from existing social services and utilities while avoiding potentially dangerous flood hazard areas. (Robinett-Arizona)

SECONDARY SUCCESSION FOLLOWING EXTENDED INUNDATION OF TEXAS COASTAL RANGELAND,
Texas A and M Univ., College Station. Dept. of Range Science.
C. J. Scifres, and J. L. Mutz.
Journal of Range Management, Vol. 28, No. 4, p 279-282, July, 1975. 3 fig, 1 tab, 3 ref.

Descriptors: *Succession, *Environmental effects, *Range grasses, *Coasts, *Floods, Ecosystems, Grasslands, Plant populations, Ranges, Texas, Rain water, Coastal bermudagrass, Grasses, Range management, Mesquite, Vegetation establishment, Vegetation, Plant growth, Burning.
Identifiers: Acacia, Setaria, Longtom(Paspalum lividum), Cynodon dactylon(L.) Pers., Sprangletops(Leptochloa spp.), Trichloris, Eragrostis, Spike dropseed(Sporobolus contractus Hitchc.).

Large areas of Texas coastal rangeland may be inundated for several years by periodic tropical storms. Prior to flooding, the land usually supports acacias-mesquite (Acacia-Prosopis) communities with herbaceous vegetation dominated by several species of Setaria. After extended inundation with fresh water, secondary succession proceeds from a sedge-sodgrass stage through a sodgrass-bunchgrass stage to a bunchgrass stage. As the water withdraws, Longtom (Paspalum lividum Torr.) initially stabilizes the area, followed by common bermudagrass, (Cynodon dactylon (L.) Pers.) as the surface dries. Sprangletops (Leptochloa spp.) are among the earliest desirable species to appear during succession, followed by species of Trichloris and Eragrostis. Spike dropseed (Sporobolus contractus Hitchc) forms a stable vegetation stage in many cases, and although highly productive, periodic burning is required for effective utilization. (Robinett-Arizona)

FLOOD PLAIN INFORMATION: NORTH FORK ST. LUCIE RIVER, ST. LUCIE COUNTY, FLORIDA.
Army Engineer District, Jacksonville, Fla.
Prepared for The Board of County Commissioners of St. Lucie County, November 1972. 26 p, 8 fig, 12 plates, 4 tab.

Descriptors: *Floods, *Flood forecasting, *Flood profiles, *Flood plains, Flooding, Flood flow, Hurricanes, Tidal waters, Tides, Historic floods, Flood data, Flood frequency, Peak discharge, Flood peak, Flow duration, Flood damage, Obstructions to flow, Canals, Warning systems, Control structures, *Florida.
Identifiers: Ten-Mile Creek(FA), Five-Mile Creek(FA), *St. Lucie River(FA), Intermediate Regional Flood, Standard Project Flood, Tidal flooding.

Properties in the study area flood plain are primarily agricultural and residential and have been developing because of an influx of retired people. Five-Mile Creek and Ten-Mile Creek with drainage areas of 10 and 80 sq. mi. respectively are tributary to the North Fork of the St. Lucie River with a drainage area of 590 square miles. The 1970 county population was 50, 836 and is expected to increase to 115,000 by the year 2000. Major floods occur in months June through October which coincides with the hurricane season. Seven floods have caused significant damage. A 1959 flood had a peak discharge of 4000 cubic feet per second. In an Intermediate Regional Flood a peak discharge of 2,300 cfs at the mouth of Five-Mile Creek, 9,800 cfs at the mouth of Ten-Mile Creek and 42,000 cfs on the North Fork of the St. Lucie River are predicted. This would produce a flood elevation of 15.4 feet above mean sea level which compares to the 7.6 feet msl elevation of the 1959 flood. Thirteen thousand acres of land would be flooded, 25% of which would be residential and 25% agricultural. Water velocities of 1 to 2 feet per second in the channel in the upper reaches and 1 to 3 ft/sec in the lower reaches are anticipated. During a Standard Project Flood a peak discharge of 2,900 cfs at the mouth of Five-Mile Creek, 12,200 cfs at the mouth of Ten-Mile Creek and 52,800 cfs on the North Fork of St. Lucie Creek are predicted. This would produce a flood elevation of 16.4 feet msl on the North Fork of St. Lucie River at White City Bridge. There are no regulatory measures in effect. (Smith - North Carolina)
W76-06282

FLOOD PLAIN INFORMATION: UVAS-CARNADERO CREEK, PAJARO RIVER TO UVAS RESERVOIR, SANTA CLARA COUNTY, CALIFORNIA.
Army Engineer District, San Francisco, Calif.
Prepared for Santa Clara County, May 1973. 20 p, 12 fig, 14 plates, 5 tab.

Descriptors: *Flood plains, Floods, *Flood profiles, *Flood stages, *Flood forecasting, Bank erosion, Warning systems, Channel improvement, Reservoirs, Peak discharge, Flow duration, Flood data, Historic floods, *California, *Flash floods.
Identifiers: Uvas-Carnadero Creek(Ca), Santa Clara County(Ca), Gilroy(Ca), Pajaro River(Ca), San Jose(Ca), Santa Cruz Mtns.(Ca).

The Uvas-Carnadero system (drainage area 90 sq mi) is approximately 26 miles long with its headwaters in the Santa Cruz Mountains, in southern Santa Clara County. It flows generally southeast to join the Pajaro River about six miles south of Gilroy. Continued area growth is expected to cause Gilroy to expand to the south and west into the primarily agricultural flood plain of Uvas-Carnadero Creek. Bridges and vegetation can be expected to obstruct flood flows. Flood damage reduction measures have been limited to channel maintenance and construction of levees by local interests. Uvas Dam, completed in 1957 by the Santa Clara Valley Water Conservation District, can serve to regulate flood flows. No storage capacity is set aside for flood control purposes, thus limiting its effectiveness. Santa Clara County Flood Control and Water District has organized an Emergency Operations Center for monitoring flood situations. Flooding can occur from November to April, normally a rapid rate of rise occurs and the flood will stay out of the bank for less than one day. The worst flood of record in December 1955 forced the evacuation of 225 persons, inundated and damaged farm land, and eroded channel banks. Peak discharge reached 14,000 cubic feet per second at the mouth of the Carnadero Creek. The Intermediate Regional Flood and the Standard Project Flood will have peak discharges of 18,900 and 21,000 cfs respectively. Channel velocities will be 4-15 ft/sec during IRF. Overbank velocities will generally be less than 4 ft/sec. Flooding in Gilroy is expected to be 6 inches to 1 ft in the area south of Sixth Street. (Henley - North Carolina)
W76-06283

FLOOD PLAIN INFORMATION: STILL AND MAD RIVERS, TOWN OF WINCHESTER, CONNECTICUT.
Corps of Engineers, Waltham, Mass. New England Div.
Prepared for the Town of Winchester, Connecticut, May 1972. 31 p, 9 fig, 7 plates, 7 tab.

Descriptors: Floods, *Flood plains, Dams, *Flood profiles, Snowmelt, *Flood forecasting, Runoff, Hurricanes, Storms, Historic floods, Peak discharge, Flood peak, Flow characteristics, Flood damage, Warning systems, Flooding, *Erosion, *Connecticut.
Identifiers: *Mad River(CN), *Still River(CN), Winchester(CN), Winsted(CN), Litchfield County(CN), Indian Meadow Brook(CN), Mill Brook(CN), Rugg Brook(CN), Berkley Pond Brook(CN), Intermediate Regional Flood, Standard Project Flood, Farmington River Basin.

Mad River (drainage area 33.3 sq. mi.) flows into the Still River (drainage area 84.4 sq. mi.) in the southeastern part of the city of Winsted which is within the town of Winchester in Litchfield County. The Mad River, characterized by rapid flow and high flood flows, is fed by Indian Meadow Brook, Mill Brook, Rugg Brook, and Berkley Pond Brook, sources of high runoff during heavy rainfall or rapid snowmelt. Flooding can occur in any season and has historically resulted from hurricanes, general rainstorms, and snowmelt. The flood of August 1955 incurred heavy urban and industrial losses in the area (damage $21 million) and resulted in seven deaths. Peak discharges on the Mad and Still Rivers reached 15,100 and 36,300 cubic feet per second, respectively. The Intermediate Regional Flood would have peak discharge of 4,500 and 18,000 cfs on the Mad and Still Rivers respectively. The Standard Project Flood would have peak discharge of 8,000 and 22,150 cfs on the Mad and Still Rivers respectively. The IRF would result in residential, industrial, and limited commercial losses. Channel velocities would range from 5-25 ft/sec on the Mad River. Many of the 17 bridges that cross the two rivers would obstruct flow during an IRF and a SPF with erosion of channel and side bank areas. Since the disastrous flood of 1955 the Corps of Engineers has completed two projects, the Mad River Dam and Sucker Brook Dam which help control flood flows. Consequences of future flooding, however, could be increasingly costly as expected development in the flood plain occurs. (Henley - North Carolina)
W76-06284

FLOOD PLAIN INFORMATION: COASTAL AREAS, SARASOTA COUNTY, FLORIDA.
Army Engineer District, Jacksonville, Fla.
Prepared for the Board of County Commissioners of Sarasota County, May 1973. 28 p, 7 fig, 16 plats, 3 tab..

Descriptors: *Floods, *Flood profiles, *Tidal waters, *Flood plains, Flooding, Hurricanes, Tides estuaries, Historic floods, Flood peak, Flood waves, Erosion, Non-structural alternatives, Flood plain zoning, Warning systems, Gulf of Mexico, *Florida.
Identifiers: Sarasota(FA), Venice(FA), Tidal flooding, Intermediate Regional Hurricane, Standard Project Hurricane, Keys.

The coastal study area is about 35 miles long and 1 to 3 miles wide with tidal flood plain extensively developed with residences, including multi-story apartments, commercial establishments and recreation facilities. The entire county had a popu-

lation of 120,413 in 1970 and is expected to increase to 215,000 by the year 2000. The county is composed of low-lying keys with almost continuous development separated from the mainland by bays and inlets. Inflow through the inlets and overtopping of the keys in severe storms can cause flooding. Both fresh-water floods due to intense rain and tidal floods caused by hurricanes and tropical storms occur. The latter storms are likely to occur in months June through November and primarily in September and October. The largest storm in the area caused a tide of 7 feet above mean sea level (msl). Total loss was estimated at $200,000. An Intermediate Regional Hurricane is predicted to have a central pressure of 27.45 inches of mercury, a radius of maximum winds equal to 14 nautical miles, winds of 110 mi/hour, and a forward speed of 11 knots. The tidal flood would reach an elevation of 12 feet msl along the open coast and interior coastal bays. This level would decrease about 1 foot per mile moving inland. About 17,000 acres would flood, including 10,000 developed acres and 12,000 structures. The Standard Project Hurricane would have a central pressure of 27.04 inches, a 16 nautical mile maximum radius, winds of 116 mph, and a forward speed of 18 knots. This would produce a tidal peak of 14.5 feet msl. About 28,000 acres would flood, 11,800 developed acres and 12,500 structures. City and County ordinances for zoning exist. (Smith - North Carolina)

FLOOD PLAIN INFORMATION: COASTAL AREAS, ST. LUCIE COUNTY, FLORIDA.
Army Engineer District, Jacksonville, Fla.
Prepared for the Board of County Commissioners of St. Lucie County, July 1972. 24 p, 10 fig, 12 plates, 3 tab.

Descriptors: Floods, *Flood forecasting, *Flood profiles, *Hurricanes, *Tidal waves, *Erosion, Flood plains, Flooding, Shores, Flood data, Historic floods, Flood waves, Warning systems, Bulkheads, Waves(Water), Beaches, *Florida.
Identifiers: *Indian River(FA), Fort Pierce(FA), St. Lucie County(FA), Standard Project Hurricane, Tidal flooding, Intermediate Regional Hurricane, Jack Island(FA), Hutchinson Island(FA), Overtopping, Wave runup.

Properties in the portion of St. Lucie County covered here are primarily devoted to commercial fishing, the shipping industry, and other commerce. On Hutchinson Island, immediately south of Ft. Pierce Inlet, new residential development has started. If recreation demands increase as expected, development could increase rapidly. Jack and Hutchinson Islands average about 3 feet above mean sea level. An area 21 miles long and 2 to 3 miles wide separated from the rest of the county by a high ridge is described. Major floods are caused by abnormally high tides associated with a hurricane or tropical storm, generally in June through October. Flooding due to hurricane tides is generally less than 12 hours, reaching a peak in about 6 hours. A 1928 hurricane had winds over 100 mph in West Palm Beach (FA) and caused the loss of 2000 lives and considerable property damage. Relief efforts cost $25 million. The 1949 hurricane had winds of up to 120 mph in West Palm Beach and caused 2 deaths and $45 million in damage. In an Intermediate Regional Hurricane tidal elevations 7.3 feet above msl is possible along the open coast and 5 feet msl in the Indian River. Runup could reach 13 feet msl. Maximum wind speeds could reach 88 mph. In a Standard Project Hurricane an elevation of 9.6 feet msl is possible in open water and 7 feet msl in the Indian River. Runup could be 12 to 15 feet msl depending on the slope. Winds are estimated at 111 mph. Hurricane tides generally rise at 1 to 2 ft/hour, peak after 6 hours, and remain above normal less than 12 hours. Water velocities higher than 3 ft/sec are likely with higher velocities in open areas under the effect of hurricanes. Extensive erosion and structural damage to buildings are anticipated. (Smith-North Carolina)
W76-06354

FLOOD PLAIN INFORMATION: VAN DUZEN RIVER, HUMBOLT COUNTY, CALIFORNIA.
Army Engineer District, San Francisco, Calif.
Prepared for Humboldt County (CA), July 1973. 20 p, 9 fig, 13 plates, 6 tab.

Descriptors: *Floods, *Flooding, *Flood profiles, *Historic floods, *Flood plains, Streamflow forecasting, Flood data, Flood Frequency, Peak discharge, Obstruction to flow, Non-structural alternatives, Flood plain zoning, Levee, *California.
Identifiers: *Van Duzen River(CA), Humboldt Co(CA), Alton(CA), Yager Creek(CA), Bridgeville(CA), Hydesville(CA), Carlotta(CA), Eel River(CA), Intermediate Regional Flood, Standard Project Flood.

Land in this study area is used as rances and farms in the canyon through which the Van Duzen and its tributaries run, though most of the development occurs in the floodplain at the mouth of the Van Duzen in the communities of Alton, Hydesvile and Carlotta. The drainage area of the Van Duzen is 417 square miles downstream from Yager Creek. The river flows through steep, narrow-sided canyons at an average slope of 11 feet per mile. Normal annual precipitation is from 40 to 70 inches, and about 40% of the rain occurs in December and January. Six gaging stations operate on the Van Duzen River and records from these indicate the largest flood occurred in 1964 when the peak discharge was 48,700 cubic feet per second. At this time the Yager Creek had a peak discharge of 30,000 cfs. This flood caused damage estimated at $4,000,000 and one bridge was destroyed. In the event of an Intermediate Regional Flood a peak discharge of 94,000 cfs at the mouth of the Van Duzen River along with water velocities of 6 to 10 ft/sec in the channel in the upper reaches and 3 to 6 ft/sec in the lower reaches is predicted. The flood plain is classed as rural and 3000 acres are subject to flooding. The flood would rise 9 feet in about 40 hours and floodstage would last 71 hours. In a Standard Project Flood a peak discharge of 117,000 cfs is predicted and water velocities slightly higher than the Intermediate Regional Flood. The flood would rise 10 feet in 40 hours and floodstage would last 76 hours. None of the 3 bridges on the Van Duzen would be obstructive to either flood unless there is debris accumulation. (Smith-North Carolina)
W76-06355

FLOOD PLAIN INFORMATION: SAN TIMOTEO CREEK, VICINITY OF LOMA LINDA, SAN BERNARDINO COUNTY, CALIFORNIA.
Army Engineer District, Los Angeles, Calif.
Prepared for San Bernardino County Flood Control District, June 1973. 55 p, 49 fig, 22 plates, 5 tab.

Descriptors: Flood flow, *Flood profiles, *Flood damage, *Flood plains, *Flood data, *Flood forecasting, *Erosion, Deposition, Storms, Flood frequency, Flood stages, Peak discharge, Flow duration, Flood peak, Floodways, Channels, Warning systems, Zoning, Channel improvement, *California.
Identifiers: San Bernardino County(Ca), San Timoteo Creek(Ca), Loma Linda(Ca), Riverside County(Ca), Santa Ana River(Ca), Wilson Creek(Ca), Redlands(Ca), Colton(Ca), San Bernardino(Ca), Bryn Mawr(Ca), Noble Creek(Ca), San Gorgonia Creek(Ca), Intermediate Regional Flood, Standard Project Flood.

The study area is the 6.5 mile reach of San Timoteo Creek from about 1 mile downstream from the San Bernardino-Riverside County boundary, to its confluence with the Santa Ana River, draining an area of 126 sq mi in southwestern San Bernardino County. This area includes Noble and Little San Gorgonia Creeks, the City of Loma Linda (population 10,000), parts of the cities of Redlands, Colton and San Bernardino, and the community of Bryn Mawr. Development in the flood plain consists of commercial (truck-stops, railroad sidings, storage yards), residential (light to medium density) and agricultural (citrus groves) uses. Continued development is expected. Flooding has historically occurred (13 large floods in the past 100 years) as the result of general summer storms, local summer storms and general winter storms. In January and February 1969 floods in San Bernardino County left 13 dead with $54 million damage. Damages in the San Timoteo study area (estimated at $6 million) were increased by the incidence of severe erosion, mudslides and the deposition of sediments (2-3 feet in portions of Loma Linda). The February flood, designated as a 50 year flood, is compared with the Intermediate Regional Flood and the Standard Project Flood, which would have peak discharges of 24,000 and 46,000 cubic feet per second respectively at the San Bernardino-Riverside County line. During IRF, channel and overbank velocities would reach 12-20 and 4-8 ft/sec respectively. Deposition and erosion will occur at bridges and embankments. Flood control efforts by San Bernardino County include channel improvements and flood plain zoning regulations (not yet covering the study area). (Henley-North Carolina)
W76-06356

FLOOD PLAIN INFORMATION: UPPER ST. VRAIN CREEK, VOLUME IV, BOULDER COUNTY, COLORADO.
Army Engineer District, Omaha, Nebr.
Prepared for City of Longmont and Boulder County, September, 1972. 24 p, 13 fig, 10 plates, 8 tab.

Descriptors: *Floods, *Flood flow, *Flood plains, *Flood stages, *Snowmelt, *Flood profiles, Runoff, Historic floods, Flood data, Flood frequency, Peak discharge, Flood peak, Flow duration, Flow characteristics, Floodways, Flood damage, Channels, Planning, Dams, *Colorado.
Identifiers: St. Vrain Creek(Co), Boulder County(Co), Lyons(Co), North St. Vrain Creek(Co), South St. Vrain Creek(Co), Rocky Mountains(Co), Intermediate Regional Flood, Standard Project Flood, Longmont(Co).

The study reach extends upstream from the confluence of two streams at Lyons (drainage area at Lyons 219 sq. mi.), 3.7 miles along the North St. Vrain Creek, and 1.5 miles along the South St. Vrain Creek, and downstream from the confluence point along St. Vrain Creek for 5.2 miles. St. Vrain Creek slopes between 42-48 ft/mi. The channel bed has cobbles and small boulders. Development in the flood plain includes residential and commercial uses. Pressure for more flood plain development is expected as Lyons (population 958) continues to grow due to the lack of suitably sloped land in the area plus the attraction of living near the stream. Eleven bridges, raised road surfaces and residential development can obstruct flood flows. Flooding (9 floods in the last 108 years) has occurred from May through September as the result of snowmelt runoff combined with rainfall. Peak flood is usually reached within several hours of the rainfall event. Flood duration is normally short but can be prolonged by continued rapid snowmelt. The Intermediate Re-

gional Flood and the Standard Project Flood will have peak discharges of 10,700 and 28,300 cubic feet per second respectively. In addition to scattered residences along the flood plains the IRF can be expected to flood large portions of the town of Lyons. Overbank flow velocities should be expected to be hazardous in Lyons and upstream. Downstream from Lyons, special care must be taken in road and building construction since modifications of the flood plain can alter flood patterns and inundate lands not now affected by flooding. (Henley-North Carolina)
W76-06357

FLOOD PLAIN INFORMATION: SALMON BROOK, EAST BRANCH AND WEST BRANCH, GRANBY AND E. GRANBY, CONNECTICUT.
Corps of Engineers, Waltham, Mass. New England Div.
January 1974. 26 p, 19 fig, 20 plates, 6 tab.

Descriptors: *Flood plains, *Channels, *Flood flows, *Flood peak, *Flood profiles, *Flood forecasting, Runoff, Storms, Hurricanes, Bank erosion, Flood data, Historic floods, Flow duration, Flow characteristics, Warning systems, Snowmelt, *Connecticut.
Identifiers: Salmon Brook(CN), East Branch Salmon Brook(CN), West Branch Salmon Brook(CN), Granby(CN), East Granby(CN), Farmington River(CN), Standard Project Flood, Intermediate Regional Flood, Hartford(CN).

Portions of the towns of Granby and East Granby, Connecticut, are subject to flooding from this 16.5 mile reach of Salmon Brook and its West and East Branches (drainage area 67.3 sq. mi.). Located in north central CN, these streams are tributaries of Farmington River. The flood plains of Salmon Brook, ranging up to 1,500 ft. in width, contain residential, commercial and farm development in the Granby area. Vegetation, 12 bridges, and narrow channel widths can restrict floodflows. Flood flows can occur in any season from general rainstorms which can be augmented by snowmelt and storms from tropical hurricanes that travel up the Atlantic seaboard. Major floods are most likely to occur in the spring, characterized by duration of from 12-36 hours. Backwater effects at the confluence of the East and West Branches as well as at Salmon Brook's confluence with Farmington River can increase flood heights during flood conditions. Flooding in August, 1955 did $3,500,000 damage in Granby and East Granby to residential, industrial, commercial and agricultural development. Peak discharge reached 40,000 cubic feet per second on Salmon Brook during this flood and can be expected to reach 29,700 cfs and 39,600 cfs during the Intermediate Regional Flood and Standard Project Flood respectively with mean channel velocities of 2-5 ft/sec. Velocities under the Penn-Central Railroad bridge are estimated for the IRF and SPF to be 15 and 17 ft/sec respectively, causing extreme erosion. (Henley-North Carolina)
W76-06358

FLOOD PLAIN INFORMATION: CYPRESS CREEK, ORANGE COUNTY, FLORIDA.
Army Engineer District, Jacksonville, Fla.
Prepared for the Board of County Commissioners of Orange County, November 1971. 16 p, 1 fig, 6 plates, 1 tab.

Descriptors: *Floods, *Flooding, *Flood forecasting, *Flood profiles, *Flood plains, Lakes, Bulkheads, Runoff, Hurricanes, Historic floods, Peak discharge, Erosion, *Florida.
Identifiers: Cypress Creek(FA), Standard Project Flood, Intermediate Regional Flood, Windermere(FA), Tropical floods.

Population in this sub-tropical area of Florida is now 1000 but rapid growth is expected because of the tremendous expansion of Orlando 8 miles away. Considerable development is anticipated on the flood plain which has residences, streets, utilities and citrus groves unless adequate land use policies are adopted. Cypress Creek drains a total of 31 sq mi and flows through a basin 12 miles long and varying from 1 to 4 miles in width. The basin has a central chain of lakes which first fill to capacity in heavy rains and then overflow into the Cypress Swamp which is drained by two 5-foot culverts. In the past minor damage has been caused to low roads and some residences. Information on flooding, available from newspaper accounts and limited gaging records, indicates that most major floods occur during the passage of hurricanes and tropical storms through or near the study area in late summer or early fall. Annual precipitation averages about 52 inches with 75% of rain falling in June through October. In an Intermediate Regional Flood a peak elevation of 102.3 ft in the northern part of the basin and 101.2 ft in the southern part can be expected. A total of 1950 acres could be flooded. Waves as high as 2 ft could be generated if windspeeds from a tropical storm reach 40 mph. Rates of flood rise should be low and several days advance warning should be possible. Peak stage should last several days and waters could be above normal high stage for a month or more. In a Standard Project Flood maximum elevations of 103.2 ft in the northern part of the basin and 101.5 ft in the southern part can be expected. There are no existing or planned Federal flood control projects, but some individuals have built bulkheads along the shores of some of the lakes which prevent some erosion. (Smith-North Carolina)

TREND SURFACE ANALYSIS OF POWDER RIVER BASIN, WYOMING - MONTANA,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
In: Proc. Fort Union Coal Field Symp., Vol 3: Reclamation section. p. 280-288. (Montana Acad. Sci., Billings, April 1975), 5 fig, 9 ref.

Descriptors: *Land reclamation, *Terrain analysis, *Regression analysis, *Landscaping, *Aesthetics, Landshaping, Slopes, Land use, Geomorphology, Wyoming, Montana.
Identifiers: Premining inventory of landscape, Quantitative geomorphology, *Powder River Basin(Wyo-Mont).

Trend (regression) surface analysis provides a convenient means of understanding spatially variable information. Thus topographic parameters graphically displayed as isopleths are used to evaluate quantitatively the topography of the coal strip mining areas of Wyoming and Montana. The analysis is expected to provide insight into basic questions of surface reclamation including the following: (1) how closely should topography be returned to the way it was before mining. (2) what landscape design needed so that the mine spoil areas can aesthetically blend into the undisturbed landscape. (3) what changes in surface and subsurface hydrology can be anticipated between disturbed and undisturbed lands. (Forest Service)

DETERMINATION OF OPTIMUM QUANTITY OF SERVICE WATER OBTAINABLE FROM ONE DAM SYSTEM,
Kyushu Inst. of Tech., Kitakyushu (Japan).
S. Murakami.
Journal of Hydrology (Amsterdam), Vol. 28, No. 2/4, p 229-244, February 1976. 6 fig, 6 tab, 10 equ, 3 ref.

Descriptors: *Dams, *Markov processes, *Probability, Monthly, Constraints, Water supply, Reservoirs, Least squares method, Optimization, Reservoir releases, Systems analysis, Mathematical models, Equations.
Identifiers: *Operating rule, Heuristic programming, *Japan, Emptiness.

The monthly operating rule of a one-dam system is considered. The monthly inputs into the reservoir are approximated by Gamma-type distributions and output is constant in a period of a month. The mathematical model of the discrete dam system is

LIBRARY OF THE UNIVERSITY OF

treated as a Markov chain model. The problem is how to determine the optimum quantity in each month so as to maximize the yearly obtainable water from a dam, under the constraint that the probability of reservoir emptiness is less than 0.1. To solve this problem, heuristic programming is used. The numerical results of the optimum quantity in each month under the above constraint are shown by using the input data of real reservoirs in Japan. This method may also be applied to the problem of how to allocate the monthly release from a multi-reservoir system so as to satisfy the demand of water of a city. (Bell-Cornell)

EVALUATION OF SHORT-TERM OPERATIONAL POLICIES FOR A MULTI-PURPOSE RESERVOIR SYSTEM,
Water Resources Board, Reading(England).
D. G. Jamieson, D. K. Smith, and J. C. Wilkinson.
Journal of Hydrology, Vol. 28, No. 2/4, p 191-213, February 1976. 4 fig, 2 tab, 8 ref.

Descriptors: *Multiple-purpose reservoirs, *Water policy, *Evaluation, *Short-term planning, Water supply, Management, Flood control, Reservoir operation, Simulation analysis, Constraints, Mathematical models, Systems analysis.
Identifiers: *Operating rules, United Kingdom.

As water supply demands on existing river-regulation schemes increase, it may be possible to defer large capital expenditure by operating the existing system more efficiently, since wastage due to indifferent management can account for up to 22 percent of the total reservoir storage capacity. While not all floods can be contained by component reservoir management, many can be mitigated by careful operation of the reservoir sluices. Considered is the short-term control strategy for the management of multi-purpose reservoirs for water supply and flood alleviation in the River Dee system. As a first step towards implementation, the existing operating rules have been compared objectively to the proposed control policy, and this is reported concerning the short-term strategy. The objective of the present control policy is to contain the high flows of the catchment's headwaters in the reservoirs while the peak flows of the down stream portion of catchment pass down the main channel. Considering the proposed operation procedure, a comprehensive telemetry scheme is being installed on the Dee catchment; the optimal control of the reservoir sluices depends on the ability to forecast future flow sequences. A hydrologic simulation package (DISPRIN) acts of the telemetered rainfall data and upstream tributary flows to produce forecast hydrographs which are routed through reservoirs, if appropriate, and down the main river channel. Whereas the existing control rules attempt a compromise between flooding to critical areas, the proposed strategy gives preference to the area around Llyn Tegid. (Bell-Cornell)

RELEASE CONTROL POLICY FOR A LARGE LAKE SUBJECT TO WIND WAVES,
Water Resources Center, Budapest (Hungary).
I. Bogardi, L. Duckstein, and W. A. Metler.
Journal of Hydrology (Amsterdam), Vol. 28, No. 2/4, p 175-190, February 1976. 3 fig, 3 tab, 3 equ, 7 ref.

Descriptors: *Lakes, *Control, *Water policy, *Water levels, *Dynamic programming, *Stochastic processes, Reservoir releases, Methodology, Monthly, Water storage, Shores, Damages, Hydrologic aspects, Economics, Optimization, Inflow, Equations, Algorithms, Mathematical models, Systems analysis, *Risks.
Identifiers: Lake Balaton(Hungary), Computational procedures.

Presented is a methodology for controlling the level of a large and shallow lake subject to a double uncertainty in the state of nature. The two uncertainty components are: (1) average monthly static water level, which determines benefits and losses associated with tourism and storage of water; and (2) monthly maximum dynamic water level, which may cause extensive shore damage. The computational procedure for finding the optimum control policy utilizes stochastic dynamic programming. The methodology is demonstrated by means of the case study of Lake Balaton in Hungary where data on the water level rise caused by wind are available. The model for dependent monthly inflows has been computerized and implemented on the CDC 6400 at the University of Arizona. (Bell-Cornell)

CONTROL OF A RIVER SYSTEM WITH TWO STORAGE RESERVOIRS,
Birmingham Univ. (England). Dept. of Civil Engineering.
M. J. Hamlin, N. T. Kottegoda, and T. Kitson.
Journal of Hydrology (Amsterdam), Vol. 28, No. 2/4, p 155-173, February 1976. 4 fig, 1 tab, 10 ref.

Descriptors: *Water storage, *River systems, *Reservoirs, *Control, River regulation, Water policy, Water yield, Operations research, Hydrologic aspects, Simulation analysis, Low flow, Computer models, Reservoir releases, Constraints, Equations, Mathematical models.
Identifiers: *Severn River(England), Vyrnwy reservoir(England), Predictive models, Regulation losses, Bivariate model, Synthetic data.

Described is a system in which a number of controls are used for operational purposes. Some of these controls have been determined purely empirically as in the case of flood alleviation. The controls which protect the firm withdrawal requirements for water supply purposes from Vyrnwy reservoir are determined statistically and the control of reservoir releases for river regulation purposes are based on a crude predictive model. The investigation was undertaken to determine whether rescheduling of statutory releases from the Vyrnwy reservoir could be effectively used to improve regulation of the River Severn and thus increase the quantity of water which could be abstracted without additional capital expenditure. Regulation losses can be substantial when there is a travel time of five days, as in this case, between the reservoir and the river control point. The possibility of reducing this loss by constructing bankside storage low down in the catchment is also considered. (Bell-Cornell)

CASE STUDY: FOR THE ANALYSIS OF WATER MANAGEMENT INVESTMENTS ON HAND OF THE EXAMPLE OF THE KISKORE RIVER BARRAGE AND ITS IRRIGATION SYSTEMS,
G. Reich.
Working Paper No. 54, UNDP/UN Interregional Seminar on River Basin and Interbasin Development, Budapest, Hungary, September 1975 (Paper in French). 2 fig, 3 tab, 6 ref. (United Nations, Department of Economic and Social Affairs).

Descriptors: *Water management(Applied), *Investment, *Irrigation systems, *Economic efficiency, Social aspects, Effects, Projects, Costs, Arid lands, Europe.
Identifiers: *Tisza River Valley(Hungary), *Kiskore River Barrage(Hungary), Arid regions.

The Tisza Valley in Hungary is plagued by an increasingly serious water shortage. The canalization of the Tisza River is important in solving the problem of increasing demands for water. The most important link in the canalization is the Kiskore River Barrage and the complex system of projects connected with it. The purpose and the technical capacity figures of the system of projects and the characteristic features of their implementation are described. Included is a formulation of the perspective socio-economic effect of the system (investments and expected economic benefits) and an attempt to quantify its economic efficiency. Economic efficiency is evaluated in two different ways. This is carried out partly from an economic point of view--using prices of 1972--and partly by forming dynamic indices projected onto the year 1973, the financial main point of the investments continued and benefits carried into effect in a long period. Beside efficiency (profit return) indices, the specific costs of the projects and of the benefits produced are given as auxiliary indices. It can be stated as a final conclusion that both expected perspective socio-economic effects and the efficiency of the system of projects will form in accordance with those planned. (Bell-Cornell)

COOPERATIVE MANAGEMENT AND DEVELOPMENT OF INTERNATIONAL RIVER BASINS,
Cornell Univ., Ithaca, N.Y. School of Civil and Environmental Engineering.
L. B. Dworsky.
Working Paper No. 50, UNDP/UN Interregional Seminar on River Basin and Interbasin Development, Budapest, Hungary, September 1975. 2 charts, 18 ref, 22 p.

Descriptors: *River basin development, *Management, International commissions, Water policy, Hydrologic aspects, Economics, Decision making, Organizations, Behavior, International law, Planning.
Identifiers: *International cooperation.

This general report has three objectives, all of which follow the guidelines provided by the Seminar organizers. First, it presents some specific factors influencing cooperation among cobasin countries and discusses problems and issues affecting international water management organizations. Second, it views a number of background reports and conference papers in the light of these factors and identifies illustrative types of resource situations from these and other sources. Third, it proposes a number of questions for consideration by the Seminar and its work groups with the expectation that the results of discussions will provide substantive material for the 1977 United Nations Water Conference. Considered are factors influencing cooperation, hydrologic-economic incentives, international relations, policy-making and implementation, general problems and issues, organizational behavior, decision-making analysis, areas of international conflict, commission structure, and reviews concerning international activities, with case studies and resource situations. RIVER BASIN DEVELOPMENT FOR SOCIO-ECONOMIC GROWTH,
National Water Authority, Budapest (Hungary). Dept. of Water Management Policy.
L. David.
Working Paper No. 52, UNDP/UN Interregional Seminar on River Basin and Interbasin Development, Budapest, Hungary, September 1975. 2 fig, 7 equ, 19 ref. (United Nations, Department of Economic and Social Affairs).

Descriptors: *River basin development, *Comprehensive planning, *Optimum development plans, *Water resources, Social aspects, Economics, Growth, Constraints, Equations, Optimization, Water demand, Water supply, Runoff, Systems analysis, Mathematical models.
Identifiers: Interdisciplinary planning.

This general report analyzes the inseparable connection between socio-economic growth (SEG) and river basin development (RBD), considering RBD as a subsystem of SEG. The concept of comprehensive river basin development is discussed, its systems analysis is presented, and main conditions and means of the reasonable implementation of RBD are determined. A set of conclusions and proposals for further action is listed. The purpose of RBD is to achieve the optimum use of natural water resources on basin-wide scale during socio-economic development. The criteria of optimum use depend at all times on the constraints of SEG. RBD is a comprehensive, man-made process involving social, economic, technical, environmental, and natural elements, discussed herein in detail. The RBD process has three basic evolution periods and needs to be planned and controlled using systems analysis. The evaluation of alternative development policies and strategies can be attained using optimization techniques and mathematical models. A comprehensive, interdisciplinary approach is of growing importance, covering simultaneously the technical, economic, social, legal and administrative aspects, including problems of uncertainties. The proposals listed cover, among others, the process analysis of RBD and the development of long-range river basin planning methods, techniques and data collection. (Bell-Cornell)

Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Proceedings Paper NO. 12089, Vol. 102, No. WR1, p 163-176, April 1976. 5 fig, 1 tab, 9 ref.

Descriptors: *Water resources, *Probability, *Reservoir storage, *Hydroelectric power, *Powerplants, Methodology, Optimization, Energy, Computers, Operations research, Projects, Long-term planning, Mathematical models, Equations, Systems analysis.
Identifiers: *Systems engineering, Decomposition approach.

The introduction of large storage hydroelectric projects into an existing mixed hydro and thermal generating system increases the need for sound long-term operating policies and system development plans. The complexity of the integrated overall operation of such a generating system is too great for direct application of optimization techniques. This paper describes a methodology which performs a detailed optimization of the long-term operation of a part of the generating system, comprising a large storage hydro project and a thermal plant, under varying conditions of thermal capacity and firm energy demand. When the methodology was applied to an actual large storage hydro project the results provided considerable insight into the long-term integrated operating characteristics of hydro and thermal plants. A basis for coordinating long-term operation with the large storage hydroprojects is suggested. The methodology involves decomposing the system into separate hydrothermal subsytememes and analyzing each with a special algorithm. The method finds the best way to integrate the operation of a mixed hydrothermal electric power generation system where one or more of the reservoirs are large enough to provide overyear storage. A PRACTICAL MONTHLY OPTIMUM OPERATIONS MODEL,
Bureau of Reclamation, Sacramento, Calif. Mid-Pacific Regional Office; and Bureau of Reclamation, Sacramento, Calif. Water and Power Control Div.
D. M. Fults, L. F. Hancock, and G. R. Logan.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Proceedings paper No. 12063, Vol. 102, No. WR1, p 63-76, April 1976. 7 fig, 1 tab, 4 ref.

Descriptors: *Water resources, *Forecasting, *Mathematical models, *Computer programs, Engineering, Systems analysis, Dynamic programming, Multiple-purpose projects, Operations research, Projects, Equations, Algorithms, Reservoirs, Water policy, *Optimization, Constraints, Flood control, *California.
Identifiers: Operating policy, *Central Valley Project(Calif).

A mathematical model is developed for the Central Valley Project in California. The model produces a 12-month operating policy; it is programmed in FORTRAN IV for processing on a CDC CYBER 74 computer. Project operations managers are using the model as a decision-advising tool. This model will be coupled with a daily strategy mode. A four-dimensional dynamic programming algorithm is developed to optimize the operation of the four-reservoir system. The objective of the model is to maximize energy generation within the limits of firm water and power contracts, mandatory releases, and flood control. A unique technique given the acronym RecIP for recomputed initial policy is developed to compute the initial operating policy that is optimized. The RecIP technique is an iterative process using the results of the incremental dynamic programming algorithm to compute a new initial policy to satisfy the required end of operational period target storages desired by the user. DIVERSION OF WATER THROUGH NORTHFIELD MT. PUMPED STORAGE PROJECT,
Stone and Webster Engineering Corp., Boston, Mass. Water Resources Group.
C. W. Lockwood.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. WR1, Proceedings paper No. 12075, p 49-62, April 1976. 9 fig, 1 tab, 2 ref.

Descriptors: *Water resources, *Water supply, *Pumped storage, *Inter-basin transfers, Diversion, Inlets(Waterways), Pumping, Reservoirs, Water quality, Projects, *Connecticut River.
Identifiers: Northfield Mt. pumped storage project(Mass).

Provisions were made at the Northfield Mountain Pumped Storage Project for the diversion of 26 billion gallons or 79,800 acre-ft of water per year from the Connecticut River to the Quabbin Reservoir. The outlet works including gates, fish screens, stop logs, metering devices, and transmitting and recording devices were provided by Northeast Utilities. During periods of flood flow in the Connecticut River, excess flow will be pumped into reserve space in the upper reservoir by use of the main pump-turbine units and this will then be permitted to run through the diversion works which include the outlet works and the proposed aqueduct to the Quabbin Reservoir. Northeast Utilities is cooperating with the Commonwealth of Massachusetts in the proposed development of this source of water supply. This diversion project utilizing a pumped storage hydroelectric power project to augment a municipal water supply is unique and important. (Bell-Cornell)

WATER RESOURCES DEVELOPMENT OF INTERNATIONAL RIVERS WITH SPECIAL REFERENCE TO THE DEVELOPING WORLD,
West Indies Univ., Barbados. School of Law.
P. K. Menon.
International Lawyer, Vol. 9, No. 3, p 441-64 (1975). 24 p.

Descriptors: *Coordination, *Water resources development, *Rivers, *International law, *Conservation, Planning, Agriculture, River basins, Data collections, Construction, Maintenance, Consumptive use, International waters, Irrigation, Riparian rights, Flood control, Navigation, Prior appropriation, Dams, Industries, Electric power.
Identifiers: *International cooperation.

The rational utilization and optimum development of international water resources require cooperative and concerted action by riparian states on the basis of legal principles defining rights and obligations. International water law, which is not well developed at this time, can be divided into four categories: territorial integrity, absolute sovereignty, community in the waters, and limited territorial sovereignty. In the developed nations, controversies regarding the utilization and control of international rivers have been settled through agreements between the nations involved. In the developing nations, the trend of legal arrangements is taking on different features, including: (1) integrated basin development with multi-purpose projects and basin-wide programs; (2) joint and coordinated action; (3) community interests; (4) limitation of sovereignty; and (5) respect for national sovereignty. The administrative question that arises in undertaking the construction of projects is whether construction should be done by a joint agency or divided between the countries. A similar problem arises with respect to operation and maintenance of the projects. Where a joint agency is established for construction, it may be necessary to have special agreements concerning the proper laws to be applied. (Segall-Florida)

DYNAMICS OF MARSH LAND FORMATION AND SUCCESSION ALONG THE LOWER COLORADO RIVER AND THEIR IMPORTANCE AND MANAGEMENT PROBLEMS AS RELATED TO WILDLIFE IN THE ARID SOUTHWEST,
Arizona State Univ., Tempe.
R. D. Ohmart, W. O. Deason, and S. J. Freeland.
In: Transactions of the 40th North American Wildlife and Natural Resources Conference, 1975, Published by the Wildlife Management Institute, Washington, D.C., p. 240-251 (1975). 9 fig, 1 tab.

Descriptors: *Colorado River, *Wildlife, *Habitat improvement, *Freshwater marshes, *Succession, Ecology, Wildlife conservation, Wildlife management, *Marsh management, Riparian plants, Aquatic habitats, Southwest U.S., Arid lands, Saline water, Environmental effects, Marshes.
Identifiers: *Topock Marsh, Beaver Lake, Lake Su-ta-nah, Duck Lake, Hunters Hole, Powell Slough, Lake Tapio, Blankenship Bend, Lake Havasu, Three Fingers Lake.

Historical evidence indicates that backwater marsh situations were never very extensive or enduring (50 to 70 years) along the lower Colorado River (delta excluded). These backwaters have been and remain important habitats for many forms of wildlife, but may become useless to some wildlife in a few years because of salinization and anoxia. Increased access to the river due to road development and increased river navigability has allowed people to invade the river and its backwaters, disrupting wildlife feeding and nesting activities. Conditions have been eased somewhat by the creation of three Federal refuges on the river (Imperial, Cibola, and Havasu), but damaging human impact is still widespread. Enhancement of backwater habitats for wildlife must be a consideration in future construction projects along the river. Following construction, access roads should be completely closed to public use to at least one-quarter mile and preferably one-half mile from the marshes. Future backwaters intended for wildlife should be constructed to contain gently sloping shorelines to support emergent vegetation, yet have deepwater areas to prevent high water temperatures in summer months. Some type of water exchange with the river is required to provide fresh and cool water inflow. Backwaters must be managed to prevent silt and organic accumulation which eventually reduces the general wildlife use value. Precision dredging or draglining appears to be the best method currently available. (Robinett-Arizona)

STATE-OF-THE-ART SURVEY AND EVALUATION OF MARSH PLANT ESTABLISHMENT TECHNIQUES: INDUCED AND NATURAL; VOLUME I: REPORT OF RESEARCH,
Michigan Univ. Ann Arbor, School of Natural Resources.
J. A. Kadlec, and W. A. Wentz.
Available from the National Technical Information Service, Springfield, Va. 22161, AD-A012 834, $9.00 in paper copy, $2.25 in microfiche. Contract Report D-74-9, December 1974. 266 p, 5 fig, 8 tab, 419 ref, 4 append. Army DACW72-74-C-0010.

Descriptors: *Aquatic plants, *Marsh plants, *Marshes, Vegetation, Aquatic environment, *Marsh management, Reproduction, *Vegetation establishment, Freshwater, Saline water, Salinity, Temperature, Soils, Wetlands, Environment, *Reviews, *Bibliographies.

Knowledge of marsh and aquatic plant establishment was assessed by reviewing the literature and contacting agencies and individuals likely to have relevant information. Factors that affect plant establishment in saltwater areas include tides salinity, drainage, aeration, water table, rainfall, soil, evaporation, temperature, biota, water depth, light penetration, and current and wave action. In freshwater areas, water levels or depths, substrate, water quality, turbidity, currents and wave action are particularly important. Aquatic and marsh plants propagate naturally by both seeds and vegetative parts. The propagules are dispersed by wind, water, animals, and man. By controlling various environmental factors, it is possible to promote and encourage the natural invasion and growth of aquatic and marsh plants, especially in freshwater systems. In many cases, plantings of aquatic and marsh plants will be necessary to vegetate a new substrate. Seeding appears to be the least expensive procedure, but environmental condition must be favorable or success will be low. Transplants usually provide faster establishment and are hardier than seedlings. Efforts at establishing Spartina alterniflora in Atlantic coast marshes have shown good results. The basic problems encountered in the establishment of aquatic and marsh plants are physically unsuitable substrates, nutrient deficiencies, polluted sediments, excessive wind or current action, excessive turbidity, unfavorable patterns of water level fluctuations, and unfavorable water depths. Research is needed in aquatic and marsh plant taxonomy, biology, and ecology. Special effort should be devoted to the study of site conditions and propagule collecting and planting methods. The 703 references listed in this volume were collected for the investigation of marsh and aquatic plant establishment which is reported in Volume I, Report of Research, of this report. The purpose of this bibliography is to make available an annotated listing of references which were not cited in Volume I. Although the bibliography does not represent an exhaustive review of the literature, it does provide an extensive survey of the pertinent references on the ecology and management of aquatic and marsh plants. The references selected for this bibliography emphasize studies useful to researchers and managers and concentrates on coastal, Great Lakes, and riverine marshes. (See also W76-06635) (Sims - ISWS)

A. Rango, V. V. Salomonson, and J. L. Foster.
Available from the National Technical Information Service, Springfield, Va. 22161 as N75-18695 $5.00 in paper copy, $2.25 in microfiche. Preprint X-913-75-26, February 1975. 34 p, 8 fig, 2 tab, 9 ref.

Descriptors: *Remote sensing, *Snow cover, *Streamflow forecasting, *Runoff, Snowmelt, Snowpacks, Melt water, Satellites(Artificial), Water supply, Snow surveys, Runoff forecasting, Data processing, Analytical techniques.
Identifiers: *LANDSAT.

Low resolution meteorological satellite and high resolution earth resources satellite data have been used to map snowcovered area over the upper Indus River and the Wind River Mountains of Wyoming, respectively. For the Indus River early Spring snowcovered area was extracted and related to April through June streamflow from 1967-1971 using a regression equation (coefficient of determination = 0.91). Prediction of the April-June 1972 streamflow from the satellite data was within 3% of the actual total. Composited results from two years of data over seven Wind River Mountain watersheds indicated that LANDSAT-1 snowcover observations, separated on the basis of watershed elevation, could also be related to runoff in significant regression equations. It appears that earth resources satellite data will be useful in assisting in the prediction of seasonal streamflow for various water resources applications, nonhazardous collection of snow data from restricted-access areas, and in hydrologic modeling of snowmelt runoff. LAKE MANAGEMENT CONFERENCE, MAY 12-14, 1975.
Purdue Univ., Lafayette, Ind. Water Resources Research Center.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-251 941, $7.75 in paper copy, $2.25 in microfiche. Proceedings of Conference sponsored by the Purdue University Water Resources Research Center. 206 p. (1975). D. Wiersma ed. OWRT A-999-IND(4).

Descriptors: *Lake Morphology, *Lake Fisheries, *Aquatic Weed control, *Herbicides, *Wetlands, *Fish management, Lakes, Lake basins, Limnology, Eutrophication, Recreation facilities, Indiana.
Identifiers: *Lake renovation, Biologic weed control.

This is the proceedings of a two-day conference sponsored by the Purdue University Water Resources Research Center. The program was developed for a lay audience interested in the maintenance and restoration of the natural lakes of Northeastern Indiana. It began with a discussion of the origin and general characteristics of Indiana lakes followed by presentations related to the role of government and local institutions as regulating agents. The second day dealt with some of the biological, physical and chemical means for restoring and maintaining lake quality. A panel discussion was held on the controversial issue of the phosphate ban in detergents. Panel members presented short papers after which there was a lively participation by the audience. USE OF RADAR INFORMATION IN DETERMINING FLASH FLOOD POTENTIAL,
National Weather Service, Garden City, N.Y. Eastern Region.
E. Wasserman.
NOAA TM NWS ER-60, December 1975. 10 p, 3 tab, 4 ref.

Descriptors: *Meteorology, Hydrology, *Precipitation(Atmospheric), *Flash floods, *Flood forecasting, Flood control, Warning systems, Rainfall intensity, Weather data, *Radar, Weather forecasting.
Identifiers: *Flash-flood potential, Flash flood guidance, MDR observations.

A systematic method is described in which manual digital radar values are used with flash flood guidance to help isolate areas where there is a flash flood potential. Radar estimates of maximum precipitation are compared objectively with the minimum, three-hour precipitation amounts required for flash flooding. Through this comparison, areas that have a potential for flash flooding are determined. Flash Flood Guidance is the minimum rainfall required for flash flooding. Using the three latest manually digitized radar (MDR) observations, a three-step procedure is presented for monitoring flash flood potential. A fourth step which requires detailed radar information, such as remote radar facsimile data, also is described. (NOAA)

THE IMPACT OF OVERWINTER DRAWDOWN ON THE AQUATIC VEGETATION OF THE CHIPPEWA FLOWAGE, WISCONSIN,
Wisconsin Univ., Madison. Environmental Resources Extension.
S. A. Nichols.
Wisconsin Academy of Sciences, Arts and Letters, Vol. 63, p. 176-186, 1975. 1 fig., 5 tab., 12 ref.

Descriptors: *Aquatic weed control, *Plant populations, *Drawdown, Water level fluctuations, Reservoirs, Winter, Wisconsin.
Identifiers: Chippewa Flowage(Wis.).

The stabilization of aquatic plant species in response to 50 years of water level fluctuations in the Wisconsin Chippewa Flowage (a 6120 ha area of interconnected bays, lake basins, and flood river channels operated as a storage, flood control, and recreation reservoir) is indicated. The variety of plant species is now much greater and there is no significant decrease in diversity with increased drawdown and in fact some of the highest diversity occurs in areas that had the greatest amount of drawdown. Although the water levels, fluctuate dractically, most fluctuations do not occur during the growing season. Exposure of reproductive parts is not always detrimental and may even be beneficial or necessary for germination of certain species. Clyceria borealis, Leersia orozoides, Polygonum natans, Salix interior, Scripus validus and Sium suave all showed an increase under drawdown conditions, as these species can survive under both terrestrial and aquatic situations. Asclepias incarnata, Brasenia schreberi, Elocharis acicularis, Nuphar variegatum, Numphaea tuberosa, Potamogeton ampliflolius, Potentilla palustris, and Sagittaria latifloria showed a preference for stabilized water levels. Najas flexilis, Potamogeton americanus, P. foliosus, P. gramineus and Anacharis canadensis appear to be able to recover and actually can increase after repeated drawdowns. (Auen-Wisconsin).

4B. Groundwater Management

KANSAS GROUNDWATER POLICY SEMINAR,
Kansas Water Resources Research Inst., Manhattan.
L. F. Keller.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-251 545 , $4.50 in paper copy, $2.25 in microfiche. KWRRI Contribution No. 171, October 1975. 62p 2 fig, 4 append. OWRT A-064-Kan(1) 14-31-0001-5016.

Descriptors: *Groundwater mining, *Kansas, Decision making, Water policy, Future planning(Projected), Groundeater resources, Water supply, Water management(Applied), Conferences, Research priorities, Water utilization.
Identifiers: Applied research, Policymakers, Groundwater seminar, Future groundwater policies.

The project was a seminar designed on groundwater mining in Kansas. Policy makers and experts on water resources, both from within and outside the University, acted as research resources, project critics and reality checks for student research. Both policymakers and experts made presentations to particular sessions of the seminar and indicated future research topics on groundwater. Three topics are required: (1) the siminar and how well it worked; (2) Kansas groundwater policies and (3) future policy issues in groundwater mining.

THE ROLE OF GROUNDWATER IN RURAL SUPPLIES IN GHANA,
Ghana Water and Sewerage Corp., Bolgatanga.
R. R. Bannerman.
Hydrological Sciences Bulletin, Vol. 20, No. 2, p 191-201, June 1975. 4 fig, 2 tab, 9 ref.

Descriptors: *Groundwater, *Rural areas, *Africa, Population, Water supply, Hydrogeology, Water policy, Rocks, Boreholes, Unit costs, Dug wells, Pumps.
Identifiers: *Ghana, *Rural water supplies, Rural communities, *West Africa, Villages, Hand-pumps, Hand-pump operations.

Over 60% of the population of Ghana is described as rural and is projected to remain so up to the end of the century. Water supplies for these populations are generally unsafe and unreliable. Waterborne diseases are endemic. Concern has been expressed in government planning and development programs; and planners were required to study the groundwater potential of the country and to what use groundwater should be put to in a rural water supply program. Results of studies conducted showed that water supply schemes based on groundwater sources have a clear economic advantage over those based on surface water. Relatively shallow boreholes equipped with dependable hand-pumps have a cost advantage over deep boreholes with motorized pumps. With the rather limited funds allocated for meeting rural water supply needs economically, a hand-pumped borehole program has been recently initiated and is already making a great impact among the rural people. PUBLIC GROUNDWATER SUPPLIES IN PUTNAM COUNTY,
Illinois State Water Survey, Urbana.
D. M. Woller, and E. W. Sanderson.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-251 550 $3.50 in paper copy, $2.25 in microfiche. ISWS Bulletin 60-18, 1976. 13 p, 2 fig, 1 tab.

Descriptors: *Water supply, *Illinois, *Groundwater resources, Well data, Unconsolidated aquifers, Gravels, Sand aquifers, Bedrock, Sandstones, Dolomite, Groundwater availability, Groundwater, Hydrology, Hydrogeology, Water sources, Water quality, Water wells, Municipal water, Water yield, Water properties, Hardness(Water), Chemical properties, Deep wells, Shallow wells, Geology, Aquifers.
Identifiers: *Putnam County(Ill), Dissolved minerals, Water bearing formations.

All available information was presented on production wells used for public groundwater supplies in Putnam County, Illinois. The definition of public water supply as contained in the Environmental Protection Act of 1970 was used to determine those water systems and wells to be included. Unconsolidated sand and gravel deposits associated with the Illinois River valley and the ancient Mississippi valley are tapped as a source of public water supply. There are 7 supply wells finished in these aquifers at depths of 100 to 237 ft. Reported yields range from 15 to 780 gpm. Analyses of water from these wells indicated that the iron content ranges from 0.0 to 7.6 mg/l, and the hardness from 296 to 379 mg/l. One well penetrates the Pennsylvanian rocks. It is 320 ft deep and is pumped at a rate of 15 gpm. A recent analysis of water from this well indicated the iron content is 0.42 mg/l and the hardness is 326 mg/l. The deep-lying Galena-Platteville Dolomite and Glenwood-St. Peter Sandstone are also tapped as a source of public water supply. Three wells in use range in depth from 1741.6 to 1793 ft. They are pumped at rates of about 60 to 150 gpm. Analyses of water from these wells show the iron content ranges from 0.1 to 3.8 mg/l, chlorides from 240 to 3690 mg/l, sodium from 245 to 2550 mg/l, hardness from 219 to 238 mg/l, and total dissolved minerals from 975 to 6333 mg/l. INdividual production wells for each supply were described in the order of their construction. The description for each well includes the aquifer or aquifers tapped, date drilled, depth, driller, legal location, elevation in feet above mean sea level, log, construction features, yield, pumping equipment, and chemical analyses. PUBLIC GROUNDWATER SUPPLIES IN MACOUPIN COUNTY,
Illinois State Water Survey, Urbana.
D. M. Woller.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-251 674 $3.50 in paper copy, $2.25 in microfiche. ISWS Bulletin 60-17, 1976. 9 p, 1 fig.

Descriptors: *Water supply, *Illinois, *Groundwater resources, *Well data, Unconsolidated aquifers, Gravels, Sand aquifers, Groundwater, Groundwater availability, Hydrology, Hydrogeology, Water sources, Water quality, Water wells, Municipal water, Water yield, Water properties, Hardness(Water), Chemical properties, Shallow wells, Geology.
Identifiers: *Macoupin County(Ill), Dissolved minerals, Water bearing formations.

All available information was reported on production wells used for public groundwater supplies in Macoupin County, Illinois. The definition of public water supply as contained in the Environmental Protection Act of 1970 was used to determine those water systems and wells to be included. Sand and gravel deposits in the unconsolidated materials above bedrock are tapped as the sources for three public water supplies. There are presently five public supply production wells, ranging in depth from 34 to 54 ft. Their reported yields range from 15 to 150 gpm. Past and present analyses of water from the three groundwater supplies indicated that the iron content ranges from 3.1 to 19 mg/l, and the hardness from 176 to 580 mg/l. Individual production wells for each supply were described in the order of their construction. A description for each well includes the aquifer tapped, date drilled, depth, driller, legal location, elevation in feet above mean sea level, log, construction features, yield, pumping equipment, and chemical analyses. PLANNING A MUST FOR GROUNDWATER DEVELOPMENT,
Clinton Bogert Associates, Fort Lee, N.J.
J. J. Baffa.
Water and Wastes Engineering, Vol. 12, No. 2, p 44-50, Feb., 1975. 3 fig.

Descriptors: *Aquifers, Groundwater, *Groundwater recharge, *Groundwater potential, *Artificial recharge, *Natural recharge, Water resources, Injection wells, Boundaries, Water quality, Land use, Borehole geophysics, Maryland, Oklahoma, New York.
Identifiers: *Long Island(NY), *Riverhead(NY).

Careful analysis is needed in groundwater aquifer development. Quantity of groundwater available is related to aquifer extent and properties, recharge characteristics, natural discharge, artificial recharge possibilities, drought occurrence, and withdrawals already being made. Quality is related to the naturally occurring relationships of solubili

ty and ion exchange of soil rocks. Geophysical methods and bore holes can suggest location of aquifers. Resistivity methods can be used to locate groundwater boundaries such as faults and dykes. Induced recharge can be accomplished by creating a reservoir in a natural streambed located in a recharge area. Rates of .1 to .4 feet per day have been reported for this type of recharge depending on local conditions. Artificial recharge of special recharge basins or wells is from diversion of stream flow from peak discharge periods or of storm water. Recharge rates of 30 feet per day and occasionally as high as 100 feet per day have been recorded. Injection wells operate in the range of 50 to 3000 gallons per minute. In designing groundwater supply, account must be taken of the effects of urban and agricultural land use, sanitary landfills, dissolved solids present, biological activity and the possibility of purifying water before recharge. It is good practice to undertake pilot projects before undertaking large scale facilities; well performance, well levels, hydrodynamic dispersion of recharge waters, and water quality effects may be measured in order to estimate recharge potential. BIBLIOGRAPHY OF STUDIES ON THE DENSITY AND OTHER VOLUMETRIC PROPERTIES FOR MAJOR COMPONENTS IN GEOTHERMAL WATERS, 1928-1974,
Geological Survey, Menlo Park, Calif.
R. W. Potter, D. R. Shaw, and J. L. Haas, Jr.
Open-file report 75-147, 1975. 78 p.

Descriptors: *Geothermal studies, *Bibliographies, *Reviews, *Publications, *Thermal water, Properties, Chemical properties, Salts, Density, Natural resources, Energy, Information retrieval.

This bibliography is an annotated listing of 230 references pertaining to the density of solutions of importance to geothermal exploration and energy production. The scope of this report has been restricted to reference containing data on aqueous solutions of the following salts: HC1, NaC1, KC1, CaC12, FeC12, H2S04, NaHS04, Na2S04, KHS04, K2S04, FeS04, H2C03, NaHC03, Na2C03, KHC03, K2C03, NaOH, KOH, Si02(ag), 'sea water'. The bibliography is a first step toward satisfying the needs of scientists and engineers as were expressed at the Conference on Thermodynamics and National Energy Problems and as further amplified by an an hoc committee of scientists convened by the U.S. Atomic Energy Commission. Support for this work has come from the U. S. Geological Survey's geothermal research program. (Woodard-USGS9

AQUEOUS SOLUBILITY OF PETROLEUM AS APPLIED TO ITS ORIGIN AND PRIMARY MIGRATION,
Geological Survey, Denver, Colo. Office of Energy Resources.
L. C. Price.
American Association of Petroleum Geologists Bulletin, Vol 60, No 2, p 213-244, February 1976. 19 fig, 9 tab, 175 ref.

Descriptors: *Solubility, *Oil, *Aqueous solutions, *Groundwater, *Temperature, Depth, Aquifers, Thermal water, Chemical reactions, Salinity, Vertical migration, Oil industry, Organic compounds.
Identifiers: *Petroleum.

The aqueous solubilities of individual hydrocarbons, petroleums, and petroleum fractions increase with increasing temperatures as determined by solubility data gathered in this study. The rate of solubility increase is uniform from room temperature to about 100 deg C where it increases drastically. At temperatures in excess of 180 deg C petroleum solubilities in water are high enough to account for the formation of petroleum deposits by a molecular-solution primary-migration mechanism. For example, the aqueous solubility of the gas-oil fraction (boiling range 316-371 deg C of the Ghawar Arabian crude oil shows over a 400-fold increase from 25 deg C to 180 deg C from 0.042 ppm to 17.0 ppm. The pronounced decrease in solubility of petroleums at the lower temperatures at shallow lower basin depths and from the movement of fresh shale waters into salty sand waters both readily serve to release dissolved hydrocarbons during the upward movement of deep basinal waters. Other investigators have shown that 15-20 percent water, by volume, remains in the clastic sediments at depths below 4.27-5.49 km in the Gulf Coast and other basins. This quantity of water as shown by mass-balance calculations is sufficient to account for the primary migration of petroleum from source rocks by molecular solution. Faults are believed to provide the main pathway for the vertical movement of water and dissolved hydrocarbons from great basinal depths. (Woodard-USGS)
W76-06455

SOUTHEASTERN MICHIGAN WATER-RESOURCES STUDY: GROUND WATER AND GEOLOGY,
Geological Survey, Lansing, Mich.
F. R. Twenter.
Geological Survey Data report, 1975. 143 p, 31 fig, 36 tab, 46 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water quality, *Hydrogeology, *Michigan, Data collections, Water supply, Water demand, Water utilization, Water yield, River basins.
Identifiers: Southeastern Michigan.

Southeastern Michigan, an area of 5,407 sq mi, encompasses all or parts of 13 counties and is drained by 7 major streams. About half of the State's population reside in the area. The land surface ranges in altitude from about 570 ft to about 1,200 ft. Precipitation ranges from 28 to 34 in annually. The average stream discharge in the area is about 2,300 cfs. Both bedrock and glacial deposits yield water to wells in the study area. Aquifers of both rock types underlie parts of the area. Of the bedrock formations that are tapped, the Saginaw Formation, Marshall Formation, Berea Sandstone, Sylvania Sandstone, and Bass Islands Dolomite generally yield the greatest quantities of water--in some places as much as 300 gpm. In the glacial deposits, sand and gravel, often occurring as outwash, are the principal water-producing rocks. In some places as much as 3,000 gpm can be obtained from these rocks. In both bedrock and glacial deposits the concentration of dissolved solids increases as the well depth increases. Many deeper wells yield water that is too highly mineralized for most uses. (Woodard-USGS)
W76-06457

PROGRESS REPORT ON THE WATER RESOURCES INVESTIGATION OF MARTIN COUNTY, FLORIDA,
Geological Survey, Tallahasee, Fla.
J. E. Earle.
Open-file report FL 75-521, 1975. 20 p, 10 fig, 1 tab, 6 ref.

Descriptors: *Water resources, *Data collections, *Water quality, *Florida, Groundwater, Surface waters, Aquifer characteristics, Water level fluctuations, Withdrawal, Water supply, Municipal water, Observation wells, Salinity, Streams, Nitrogen, Phosphorus.
Identifiers: *Martin County(Fla).

The base of the shallow aquifer ranges from 125 feet below sea level in the northwest part of Martin County, Fla., to about 280 feet below sea level in the southeast part of the county. Water levels decline about 2 to 5 feet during the dry season (October 1973 to May 1974) in most areas of Martin County. Within the area influenced by the pumping of Stuart's public supply wells, water level declined 6 feet between October 1973 and May 1974. Water levels during January - May 1974 in this area were 3 to 6 feet lower than they were in January - May 1965. This difference was due to a three-fold increase in pumpage (0.8 to 2 mgd) from 1965 to 1974. Chloride concentrations in four salt water monitoring wells around the Stuart well field ranged from 35 to 45 mg/litre during the rainy season of 1973. No appreciative increase in chlorides was found by the end of the next dry season. Water from five surface water sites had higher concentrations of phosphorus than water found in a typical urban area in Fort Lauderdale. Water from seven sites contained concentrations of nitrogen less than the typical rural site average. (Woodard-USGS)

SYSTEMATIC DESIGN OF LEGAL REGULATIONS FOR OPTIMAL SURFACE -GROUNDWATER USAGE - PHASE 2,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
H. J. Morel-Seytoux, R. A. Young, and G. E. Radosevich.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-251 889, $8.00 in paper copy, $2.25 in microfiche. Environmental Resources Center, Colorado State University, Fort Collins, Completion Report Series No. 68, September 1975, 229 p. OWRT B-109-COLO(5) 14-31-0001-4067

Descriptors: Groundwater, *Surface-groundwater relationships, Regulation, Pumping, Optimization, Design, *Conjunctive use, Water law, Legal aspects, Water management(Applied), Aquifers, Computer programs, *Model studies, Water wells, Arid lands, Seepage.
Identifiers: *Groundwater management, Conjunctive operations.

The design of regulations for integrated management of surface and groundwater is a complex and crucial problem in regions of the United States with a dry climate and a paucity of water resources. Analysis of the problem indicated the need to develop a new approach to hydrologic modeling of the interactions between a stream and an alluvial aquifer. This new approach conveniently provides the aquifer response to pumping from wells, the aquifer response to seepage flow from the river and the river response to pumping from wells. Several computer programs, operating sequentially, have been developed. Tests of the programs reported here, show that the developed technique provides comparable accuracy to more standard approaches. The benefits of the new approach are realized when the hydrologic model is coupled with an economic objective and with legal constraints. Several computer programs were developed. One of these computer programs (the most important and complex one) is fully documented in this report. Illustrative applications of these programs to solution of management problems involving legal constraints and economic considerations are provided. (See also W74-04853).

GROUNDWATER RESOURCES OF ALTUN-KUPRI AREA,
Institute for Applied Research on Natural Resources, Baghdad (Iraq).
R. H. Haddad, P. B. Smoor, D. Y. Bashoo, S. K. Sarbaro, and J. J. Dunnat.
Technical Bulletin 69, September, 1974. 115 p, 37 fig, 7 tab, 17 ref, 2 append.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Transmissivity, *Storage coefficient, *Safe yield, Aquifer systems, Groundwater, Hydrogeology, Water sources, Water supply, Natural recharge, Groundwater recharge, Water resources development, Alluvium.
Identifiers: *Altun-Kupri(Iraq).

The Altun-Kupri area located in northern Iraq covers about 860 square kilometers and has large potential groundwater resources which have only been partially developed. The upper part of the aquifer system, which is the main area of present and potential development, consists of Pleistocene and recent alluvial deposits underlain by Bakhtiari formation. Recharge generally takes place in the upland outcrop area of the Bakhtiari formation and the principal zone of discharge is in the vicinity of the mouth of the Jolak Wadi. Average transmissivity of the upper part of the aquifer system was estimated at about 2200 sq m/day, and because of the generally unconfined to semi-confined nature of the aquifer, a storage coefficient of 0.1 was assumed. Recharge to the entire basin for 1973-74, based on water level fluctuations and flow net analysis, was about 84,000,000 cubic meters per year. If pumping is confined to the upper part of the aquifer system, about 36 to 68 million cubic meters per year may be available for groundwater development from both temporary and permanent storage, assuming perfect completion and distribution of wells and certain critical limits for the drawdowns permitted. (Robinett-Arizona)
W76-06576

HIDDEN WATERS IN ARID LANDS.
Report of a Workshop on Groundwater Research Needs in Arid and Semi-Arid Zones, November 25, 1974, Paris, France, International Development Research Centre, Ottawa, Canada, 1975. 18 p. 2 append. L. A. Heindl, ed.

Descriptors: *Groundwater, *Arid lands, *Water resources development, *Water supply, *Droughts, Groundwater resources, Water quality, Semiarid climates, Water shortage, Environmental effects, Social aspects, Hydrogeology, Hydrologic data, Water management(Applied).

Because arid and semi-arid zones encompass about one-fifth of the earth's surface, increasing numbers of people continue to expand the use of these regions for food production and living space. The shortage of water can be eased in many regions by use of the huge reserves of groundwater stored in confined aquifers underlying these areas, but in many regions the amount and quality available are unknown. The Association of Geoscientists for International Development attempts in this workshop to single out specific research needs by presenting country reports, in an informal setting, that deal with the sources and quality of groundwater, the environmental and cultural impact of development, and coping with drought. Recommendations call for (1) exchange of information and encouragement of research, (2) immediate attention to an array of eight specific areas of applied research, (3) prompt attention to provision for trained hydrogeologists and hydrological engineers in critical areas, (4) managerial practices in the field of water development, (5) preparation of inventories of regional groundwater resources, and (6) collection of information on local droughts by hydrogeologists. Identifiers: *Fibonacci search, *Minimizatio techniques, Buried bedrock valleys, Pascal's trian gle, Symmetry.

In areas where the bedrock is irregular, depres sions in the bedrock formation can yield signif cantly higher amounts of water because th aquifer has a greater saturated thickness. Findin these areas by drilling test holes is a common prac tice but one that can be conducted more econom cally if an efficient search procedure is utilize This paper described such a technique called th Fibonacci Search and showed that it can sav thousands of dollars in the cost of drilling te holes when compared to 'brute-force' method (Visocky-ISWS)

Identifiers: *Nomads, Desertification.

Livestock herding peoples in west and east Africa have been severely hit lately by drought conditions. Thedisaster situation has been used as a means to change the life of these peoples. The survival of such peoples depends on a precise manipulation of the ecology, rational decision making, and risk management. However factors outside their control (water development, veterinary services, the creation of new international boundaries) have contributed heavily to the overstocking problem. (Robinett-Arizona)

Identifiers: *Desertification, Sahelian zone.

Overgrazing and overly intensive cropping encourage the spread of deserts in Africa, Asia, and Latin America, and undermine the productivity of vast semiarid zones throughout the world. The evidence of desert encroachment worldwide is surveyed, and the implications of recent climatic change theories are discussed. Directions for the ecologically sustainable exploitation of arid lands are outlined. (Robinett-Arizona)

URBAN EFFECTS ON THE DISTRIBUTION OF HEAVY CONVECTIVE RAINFALL,
Illinois State Water Survey, Urbana.
F. A. Huff.
Water Resources Research, Vol. 11, No. 6, p 889-896, December 1975. 5 fig, 6 tab, 9 ref. NSF GI-38317.

Descriptors: *Rainfall, *Convection, *Rainfall disposition, *Central U.S., *Urbanization, Industries, Rainfall intensity, Weather modification, Floods, Water yield, Hydrology, Meteorology, Hydrologic aspects, Flood control, Rain gages, Sewers, Rural areas, Storms, Frequency.
Identifiers: Raincells, *Urban areas, Rainstorms, St. Louis(Mo), Alton(Ill), Wood River(Ill), Duration, Metromex, Sewer design.

Data from a network of 225 recording rain gages in 5500 sq km in the St. Louis area, operated during the summers of 1971-1973, were used to investigate potential urban effects upon the distribution of heavy rainfalls. Emphasis was placed upon analysis of: (1) rain cells, the basic convective unit responsible for the production of heavy short-duration rates in thunderstorm-dominated climates; and (2) the distribution of heavy rainstorms producing 25 mm or more of rainfall within the network. Results showed a substantially greater water yield from the urban-affected cells compared with that from the rural (control) cells. The excess was greatest in moderate to heavy storms and apparently resulted most often from enhancement of the natural atmospheric rainfall processes in organized weather systems. The 25-mm rainstorms showed a pronounced maximum of occurrence in a region that frequently lies downwind of two urban-industrial areas, St. Louis and Alton-Wood River. It was concluded that the frequency distribution of heavy rainfalls may vary significantly between urban, suburban, and rural areas in large urban-industrial regions and that this may necessitate reevaluation of sewer design storm parameters in current use. THE EFFECT OF FOREST ON MINIMUM RIVER RUNOFF IN THE BROAD-LEAVED FOREST ZONE AND FOREST-STEPPE OF THE EUROPEAN PART OF THE USSR, (IN RUSSIAN),
G. S. Pimenova.
Lesove Denie 2, p 3-10, 1975.

Descriptors: *Runoff, Rivers, Europe, Forests, *Forest management, Grasslands, Soil moisture.
Identifiers: *USSR.

Data on the minimum runoff of small rivers in the broad-leaved zone and the forest-steppe from comparison of river basins with constrasting degrees of afforestation show that large tracts of forest are of great importance in increasing the undergroung water supply. In the central part of the forest-steppe, minimum river runoff in basins with greater afforestation is almost equal. The prevalence of an unsaturated soil moisture regime in the South is noted.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: *Watersheds(Basins), *Vegetation, *Soil chemistry, *Alaska, Forests, Trees, Plant populations, Cold regions, Soil chemical properties, Humus, Organic matter, Ecology, Hydrology, Soil profiles.
Identifiers: *Caribou Creek watershed(Alas).

Studies were completed in several black spruce and aspen/birch communities of the Caribou Creek Watershed. Frequency and basal area or percent cover were detailed for tree, sapling, shrub, herbaceous, moss, and lichen species. Organic layer mass was greatest beneath a north slope black spruce community. Carbon and nitrogen levels were higher in litter layers beneath the hardwook stands, whereas carbon/nitrogen ratios were higher in the living and decaying organic mat beneath black spruce. Concentrations of P, Ca, Mg, Mn and Zn were higher in hardwood than in conifer organic layers. K and Fe concentrations in organic layers were similar beneath hardwoods and conifers. Soils beneath conifer and hardwood stands could not be separated on the basis of pH, %C, %N, or C/N ratios. Cation exchange capacity closely reflected %C in all soils. More exchangeable bases were present in soils beneath hardwood communities than beneath black spruce communities. Increases in extractable P were found near the soil surface in aspen-dominated communities. Extractable soil P increased below 15 cm in conifer stands. (Sims - ISWS)

Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
H. K. Orr.
Transaction of the ASAE, (American Society of Agricultural Engineers) Vol. 18 No. 6: p 1076-1081, 1975. 10 fig, 4 tab, 10 ref.

Descriptors: *Soil compaction, *Soil physical properties, Grazing, Grasslands, Surface runoff, Range management, *South Dakota.
Identifiers: *Black Hills, *Bluegrass bottoms, Livestock trampling, Soil recovery, Range hydrology.

Not until the second year after fencing did soils on heavily grazed bluegrass range show significantly more macro-pore volume and/or reduced bulk density. Under protection the infiltration capacities also increased and summer storm runoff decreased. More than one year of protection from trampling is needed for significant recovery from soil compaction, a matter of considerable importance in grazing management. (Forest Service)

Identifiers: Tanzania, Lesotho.

One of the necessary lines of action to change the negative trend of food and water shortages in many African countries is an improved and ecologically sound use of the natural resources of water, vegetation, and productive soil. In order to study types of soil erosion, monitor present rates of erosion and determine consequences of erosion, it is necessary to carry out continuous studies of water and sediment flow in natural watersheds under different environmental conditions and different types of land use. These studies or 'catchment diagnoses' provide a sound basis for reclamation plans, which must be adapted to the local ecological and social conditions to be successful. Every land and water development scheme should be combined with critical evaluation of its impact on the environment and on man. In particular, the reactions of the environment to exploitation should be observed and conclusions drawn for better land use from these observations. In order to compare the situation before, during and after implementation of a plan, reliable reference data such as maps, photographs and descriptions must be obtained for land and water development projects. Initial mistakes can then be recognized and corrected by means of repeated comparisons or monitoring. (Robinett-Arizona)

INFLUENCE OF VESICULAR HORIZONS ON WATERSHED MANAGEMENT,
Texas A and M Univ., College Station. Dept. of Range Science.
W. H. Blackburn, R. E. Eckert, Jr., M. K. Wood, and F. F. Peterson.
In: Watershed Management Proceedings Irrigation and Drainage Division American Society of Civil Engineers, August 11-13, 1975, Logan, Utah, p. 494-515. n.d. 11 fig, 7 tab, 6 ref.

Descriptors: *Soil horizons, *Soil surfaces, *Sediment yield, *Infiltration rates, *Plant growth, *Watershed management, Soil erosion, Arid lands, Organic matter, Topsoil, Ranges, Soil physical properties, Wettability, Soil structure, Soil strength.
Identifiers: *Seedling emergence, *Vesicular horizons.

Vesicular soil surface horizons are found extensively on arid and semiarid range lands in poorly aggregated dune interspace soils (dune interspace is the area between areas of accumulation of litter and soil under trees, shrubs and bunchgrasses). Vesicular horizons are the major factor contributing to low infiltration rates and sediment production from large areas of rangeland. The influence of vesicular horizons on infiltration rates, sediment production, and seedling emergence is discussed. Areas of litter and soil accumulation had infiltration rates near or exceeding the application rate of 3 inches per hour and sometimes 3 to 5 times greater than the dune interspace areas. Sediment is usually considerably higher from dune interspace areas than from areas of accumulation and as dune interspace areas increase, sediment production increases. More sediment is produced from initially wet soils than those initially dry. This relationship is most marked for soils with a vesicular surface horizon. Seedling emergence was higher in areas of accumulation than in interspace soils. A decrease in organic matter content increased crust hardness, while an increase in the number of water applications decreased hardness. (Robinett-Arizona)

M. Kawamura, and S. Diamond.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-242 841 $4.00 in paper copy, $2.25 in microfiche. Joint Highway Research Project Report No. 75-4, March 1975. 31 p, 12 fig, 14 ref. FHA C-36-50H.

Descriptors: *Erosion control, *Clays, Erosion, Highways, Soil erosion, Porosity, Rainfall, Raindrops, Lime, Portland cements.
Identifiers: *Hydrated lime stabilization, *Portland cement stabilization, Erosion resistance, Pore size distribution, Erosion soil loss, Soil loss, Water-stable aggregate distribution, Scanning electron microscope observations.

Accelerated soil erosion from construction sites and the resulting increase in downstream sediment load constitutes a significat environmental problem. Laboratory studies indicated that small percentages of hydrated lime or of Portland cement will stabilize clay soils against rainstorm erosion by preventing particle detachment. Coordinated measurements of the size distribution of water-stable aggregates, of pore size distribution by mercury porosimetry, and of microstructure by scanning electron microscopy and energy dispersive x-ray spectrometry were used to clarify aspects of the mechanisms responsible for the development of erosion resistance. Attainment of such resistance was marked by aggregation of a significant part of the clay into water stable aggregations of the order of several millimeters in size, and of minimal change in porosity and pore size distribution on exposure to the test rainstorms. At least some of the clay particles in the aggregations appeared to be partly converted to calcium-bearing reaction products, and formation of the 'reticulated network' variety of calcium silicate hydrate gel linking adjacent particles was demonstrated. (Lee-ISWS)

ACETYLENE REDUCTION ASSAYS FOR NITROGEN FIXATION IN FRESHWATERS: A NOTE OF CAUTION,
Manitoba Univ., Winnipeg. Dept. of Microbiology.
R. J. Flett, J. W. M. Rudd, and R. D. Hamilton.
Applied Microbiology, Vol. 29, No. 5, p. 580-583, 1975. 4 fig., 13 ref.

Descriptors: *Analytical techniques, *Nitrogen fixation, *Methane bacteria, On-site investigations, Metabolism, Oxidation, Assay, *Pollutant identification.
Identifiers: *Acetylene reduction, Ethylene.

Since organisms fixing molecular nitrogen also reduce acetylene to ethylene, gas chromatographic determination of both gases are generally used to indirectly assess nitrogen fixation, but reproducible recovery of ethylene produced in acetylene reduction assays is essential. Microorganisms oxidizing methane in lakes were studied to determine if they could use ethylene. Lake samples transformed C14 ethylene into water soluble compounds undetectable by conventional acetylene reduction procedures; methane-oxidizing bacteria appeared responsible. About 28% of added ethylene was transformed and this figure is probably an underestimate. Depth distributions of methane-oxidizing and ethylene-transforming activities, temperature response curves, and substrate competition experiments indicated that the same organisms mediated methane oxidation and ethylene transformation. Whenever and wherever methane-oxidizing bacteria are active, acetylene reduction assays may be erroneus due to ethylene transformation. Metabolized ethylene was not incorporated into cellular material. Some metabolites were water-soluble, non-volatile compounds; carbon dioxide was not a major end-product. The assumption that ethylene produced during assay is not biologically or abiologically altered during incubation is sometimes invalid, causing errors in acetylene reduction assays used in environments containing methane-oxidizing bacteria. More confidence could be placed in acetylene reduction assays if ethylene stability were demonstrated by radiochemical techniques. If ethylene transformation occurred, only N15 techniques could be accurately used. (Buchanan-Davidson--Wisconsin)

A METHOD OF DETERMINING MORPHOPHYSIOLOGICAL INDICATORS IN THE ECOLOGY OF ROTIFERS (ROTATORIA), (IN RUSSIAN),
Y. S. Chuikov.
Ekologiya 5(5), p 95-97. 1974.

Descriptors: *BioindicatorS, *Rotifers, Methodology, Ecology, Animal physiology, Microbiology, Eutrophication, Production.
Identifiers: Keratella-Quadrata-Frenzeli, Keratella-Quadrata-Quadrata, Lorica, Rotatoria.

The isolation of some morphological indices, expressing the interaction of internal and external factors for rotifer populations as indicators of ecological conditions, is proposed. In addition to such external morphological indices as the shape and dimensions of the lorica and its formations, indices of the physiological state of internal organs are also valuable: form and size of the gonads, form of the ovarian nucleus and the gastric glands, number and dimensions of eggs or embryos, periods of latent egg production and, to a certain extent, the gnathic apparatus. The use of this method of morphophysiological indicators in studies associated with the anthropogenic eutrophication of waters is illustrated using Keratella quadrata quadrata and K. quadrata frenzeli.--Copyright 1975, Biological Abstracts, Inc.

E. G. Srinath, T. B. S. Prakasam, and R. C. Loehr.
In: Proceedings of the 29th Industrial Waste Conference, Part Two, May 7-9, 1974, Lafayette, Indiana, Purdue University, p 1038-1048. 7 fig, 3 tab, 14 ref.

Descriptors: *Analytical techniques, *Nitrification, *Nitrogen, *Nitrites, Suspended solids, *Pollutant identification, Waste water treatment, Sludge, Aerobic treatment, Oxidation, Microorganisms.
Identifiers: Total Kjeldahl nitrogen, Mixed liquor volatile suspended solids, Nitrosomonas, Nitrobacter.

Various methods are available for estimating the active mass of the sludge in an aerobic treatment process, based on the biochemical characteristics of the aerobic organisms. In nitrifying systems, mixed liquor volatile suspended solids (MLVSS) is used as the parameter and is usually very crude. Results from research on the process of nitrification were used to develop a parameter for the active mass of nitrifying organisms. The oxidation rates of ammonium and nitrite of the mixed liquors (expressed as milligrams of substrate nitrogen oxidized per hour per milligram of cellular total Kjeldahl nitrogen (TKN) of the mixed liquor) were compared with the rates obtained with pure cultures of Nitrosomenas europaea, Nitrobacter agilis, and N. winogradskyi suspended at known concentration (milligrams of cellular TKN/liter) in a mineral salt medium containing their respective substrates, ammonium and nitrite. The reference pH for determining the rates was in the range of 7.4 to 7.9 since the maximum rates were obtained in this range. The ratio between the specific rates of oxidation of the mixed liquor nitrifying population and the pure cultures under similar conditions of pH and temperature represents the fraction of the TKN of the mixed liquor as contributed by the cellular TKN of the autotrophic nitrifiers. This ratio when multiplied by the TKN concentration of the mixed liquor, gives the TKN concentration of the nitrifying organisms, which can be used as an estimate of their mass. (Pinto-FIRL)

NITROSOPHENOL AND NITROSONAPHTHOL DERIVATIVES AS REAGENTS FOR SPECTROPHOTOMETRIC DETERMINATION OF IRON AND DETERMINATION OF MICRO-AMOUNTS IN WATERS WITH 2-NITROSO-5-DIMETHYLAMINOPHENOL,
Okayama Univ. (Japan). Dept. of Chemistry.
K. Toei, S. Motomizu, and T. Korenaga.
The Analyst, Vol. 100, No. 1194, p 629-636, September, 1975. 5 tab, 38 ref.

Descriptors: *Spectrophotometry, *Analytical techniques, *Nitrogen compounds, Iron, *Pollutant identification, Rivers.
Identifiers: Nitroso compounds.

The iron(II) complexes of twenty-five nitroso compounds were examined spectrophotometrically in aqueous solution for suitability as analytical reagents for iron(II) ion. Although most of the complexes with nitroso compounds had a 1:3 composition in aqueous solution and chloroform, two complexes, nitroso-DMAP and nitroso-DEAP, had a 1:4 composition. Because of this, and because the ligands possess strong electron-donating groups, the molar absorptivities of the two complexes were very large. Although the molar absorptivity of the nitroso-DEAP complex was slightly larger than that of the nitroso-DMAP complex, the latter is more useful for the determination of micro-amounts of iron. Nitroso-DMAP is more stable, and the color of its complex with iron(II) in aqueous solution is stable for much longer than nitroso-DEAP. A spectrophotometric method using nitroso-DMAP was applied to the determination of iron in city and river waters. The method possessed several advantages. The complex formed had a molar absorptivity about four times as large as that formed with 1,10-phenanthroline. Diverse ions which are generally present in natural waters did not interfere in the determination. The nitroso-DMAP complex had a wide range of pH in which the full color developed, and the simplicity of the procedure allowed measurements to be carried out in aqueous solution. (Loustau-FIRL)

CADMIUM AND ZINC CONTENTS OF CORN LEAF AND GRAIN PRODUCED BY SLUDGE-AMENDED SOIL,
Illinois Univ. at Urbana-Champaign. Dept. of Agronomy.
R. L. Jones, T. D. Hinesly, E. L. Ziegler, and J. J. Tyler.
Journal of Environmental Quality, Vol. 4, No. 4, p 509-514, October/December, 1975. 5 fig, 3 tab, 10 ref.

Descriptors: *Cadmium, *Zinc, *Sludge treatment, *Soil analysis, Hydrogen ion concentrations, Sludge disposal, *Pollutant identification, Environmental effects, Anaerobic digestion.
Identifiers: Land application, Atomic absorption analysis.

Because the cadmium present in sludge-amended soil presents a hazard to plant and animal ecosystems, the patterns of concentrations of cadmium in plants have been related to soil pH. In animal and plant physiology, zinc is important to consideration of transport of cadmium across membranes, and levels of zinc in plant tissues were also reported. Sludge from high-rate anaerobic digestors was applied to three out of four plots of corn. Leaves and grains of the corn were sampled, and yield determinations were made. In addition, soil samples were taken. Cadmium and zinc were determined in the samples by atomic absorption analysis. The pH was determined from the soil samples in distilled water solutions. Decline in yield was the first apparent effect of some elemental excess. Increases in extractable cadmium and zinc from the sludge-amended soils was also a result. Uptake of cadmium was substantial in the case of leaves. Mechanisms appeared to operate in diminishing the concentration of cadmium in grains. Zinc contents resembled results for cadmium. Soil pH was found to interact significantly with cadmium levels in the soil to affect cadmium levels in the leaves. The interaction between pH and zinc has long been known. An important new observation was that above pH 7 when large amount of zinc were available, increases in cadmium levels in leaves were not observed. Substantial increases in zinc content could undoubtedly mediate any negative effects of sludge-enhanced cadmium levels. Furthermore, sludges that would be applied to plants for nutrients would be applied in considerably smaller amounts. (Loustau-FIRL)

CHEMICAL ANALYSIS AND ENVIRONMENTAL QUALITY,
H. Egan.
Chemistry and Industry, No. 19, p 814-820, October 4, 1975. 44 ref.

Descriptors: *Water analysis, *Analytical techniques, *Pollutant identification, Chemical analysis, Monitoring, Measurement, Water quality.

Chemical analysis can provide a measurement of the various factors which need to be taken into account in evaluating environmental quality. It can measure the level of substances, usually trace substances, which intrude in the atmospheric, aquatic or terrestrial environment, and can contribute to an understanding of the possible interactions between these factors. This article discusses various chemical monitoring methods: electro-optical devices based on ultraviolet absorption for measuring sulfur dioxide; a flame-photometric detector for sulfur compounds; infrared gas analysis and chemical reaction for measuring carbon monoxide; and, lazers for monitoring ozone, ethylene and other trace constituents in the atmosphere. Analytical methods for monitoring pollutants in aquatic environments include atomic absorption, atomic fluorescence, atomic emission and mass spectrometry, and neutron activation analysis. Study of the terrestrial environment has brought about the development of new multidetection or multiresidue methods such as gas-liquid chromatographic multidetection. There is evidence growing interest in the monitoring of the total environment by remote sensing techniques. (Loustau-FIRL)

MEASUREMENT IN WATER RESEARCH PART 1.
Measurement and Control, Vol. 8, No. 11, p 441, November, 1975. 1 fig.

Descriptors: *Water analysis, *Pollutant identification, *Analytical techniques, Heavy metals, Equipment, Instrumentation.

The Water Research Centre, Buckinghamshire, U. K., is responsible for all aspects of water supply and disposal including resources, potable water treatment, quality, and distribution, sewage treatment, industrial wastes treatment, water pollution, and sewerage.Some of the techniques used at the WRC to identify pollutants are described. A gas chromatography/mass spectrometer is used to measure organic compounds such as oils, plastics, and pesticides. Although glass capillary columns have many advantages over the stainless steel columns usually used in hydrocarbon analysis, the experimental difficulties associated with their preparation and their limited commercial availability have inhibited their use. The WRC is investigating the application of some newer types of glass columns for research and routine work in water analysis. High-pressure liquid chromatography permits materials at low concentrations to be determined relatively easily. The WRC is evaluating a flameless atomic absorption spectrometry technique for the determination of trace metals. Anodic stripping voltammetry is an electroanalytical technique for the determination of trace metals; it has been used for the analysis of potable water, seawater, and sewage and sewage effluents. Emission spectrographic analyses were performed on water samples from rivers in England and Wales to determine the baseline concentrations of trace metals in these rivers. (Orr-FIRL)

EARTHWATCH,
National Oceanic and AtmosphericAdministration, Rockville, Md. Deep Water Ports Project Office.
J. E. Jensen, D. W. Brown, and J. A. Mirabito.
Science, Vol. 190, No. 4213, p 432-438, October 31, 1975. 6 fig, 1 tab, 22 ref.

Descriptors: *Monitoring, *Data collections, Research and development, *Information exchange, Environmental effects, Water pollution, Air pollution, *Pollutant identification.
Identifiers: *Earthwatch.

Earthwatch, part of the United Nations Environment Program, is a four-part program involving monitoring, research, evaluation, and information exchange. The program, which was created in June, 1972, will provide the basis for global environmental management and supporting measures. The monitoring aspect of Earthwatch will be done at stations all over the world and in connection with organizations already established by the United Nations. Research activities include atmospheric research, and oceanic exploration. Information exchange will complement the activities and services already provided by the World Data Center. Eventually the framework for Earthwatch will be nongovernmental assessment centers around the world. (Loustau-FIRL)

EXAMINATION OF SEWAGE AND SEWAGE SLUDGE FOR ENTEROVIRUSES, VOLUME 1.
Ontario Ministry of Health, Toronto.
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 27, Training and Technology Transfer Division (Water), Environmental Protection Service, Environment Canada, Ottawa, Canada, March 1975, 35 p, 11 tab, 47 ref. 72-5-1.

Descriptors: *Sewage sludge, Sewage, Pollutants, Environment, Microorganisms, Electron microscopy, Nutrients, Heavy metals, *Pollutant identification.
Identifiers: *Enteroviruses, *Agricultural land, Chloroform, Poliovirus, Vaccines, Urban sewage, Rural land.

A promising and practical method for taking advantage of the nutrient qualities of sewage sludge is to spread it on agricultural or grass land in rural areas. This method, however, carries an inherent risk that the environment may be polluted further with harmful agents such as viruses and heavy metals. This report deals with the first phase of a virus monitoring program being carried out in the Enterovirus Laboratory of the Ontario Ministry of Health, in connection with the plans to spread urban sewage sludge on rural land in Ontario. The results of this program include virus surveillance studies on five Ontario plants which employ different phosphate removal techniques, as well as related laboratory studies. (Environment Canada)

Identifiers: *Dimethylamine(DMA), *Dimethylformamide(DMF), Flame-ionization detector, Total ionic current, Collector current, Organic sorbents.

The reliability of data on the contents of dimethylamine (DMA) and dimethylformamide (DMF) in water using gas chromatography and the gas chromatograph-mass spectrometer combination was assessed. Regarding the practical requirements of the industry, attention was concentrated on the concentration range of 0 to 500 mg/l. Using gas chromatograph with the flame-ionization detector, hundreds of ppb of DMA and the ppm level of DMF can be determined in aqueous solutions. With gas chromatography-mass spectrometer system, monitoring the total ionic current, similar concentrations are detectable as with the flame-ionization detector, but the detection limit is substantially lowered to 10 ppb for both DMA and DMF, when the collector current is monitored. Identifiers: *Ammonia probe, *Specific ion electrode, *Kjeldahl nitrogen, Technicon autoanalyzer, Distillation-Nesslerisation, Polytetafluoroethylene membrane, Kjeldahl method, Automated digestion, Flow-through system.

A commercially available ammonia probe was used in an automated continuous flow-through system to determine the ammonia-N concentration in Kjeldahl digests of fresh waters. The method is suitable for samples with Kjeldahl-N concentrations greater than 0.1 mg N/l. In the 0.1-1.0 mg N/l range 10 digests/h can be analyzed. Only microdigestion equipment and sample volumes of 25 ml are required. The ammonia probe with modified filling solution and polytetafluoroethylene membrane is sufficiently stable for continuous use throughout a working day. Analyses of Kjeldahl digests of freshwater samples by this method and the distillation-Nesslerisation procedure showed good agreement. More precise results were obtained by the ammonia probe method. The ammonia probe method obviates the steam-distillation operation which is time-consuming and during which errors can be easily introduced by loss or gain of ammonia. (Henley-ISWS)

MULTIVARIATE AND SEQUENTIAL STATISTICAL PROCEDURES IN THE BIOLOGICAL ASSESSMENT OF WATER QUALITY,
Colorado State Univ., Fort Collins. Dept. of Statistics.
T. T. Keefe, and E. P. Bergersen.
August 1975. 82 p, 20 fig, 13 tab, 57 ref, append. 14-06-D-7550.

Descriptors: *Water quality, *Statistical methods, *Graphical analysis, Fish behavior, *Biological communities, Aquatic communities, *Bioindicators.
Identifiers: *Species diversity.

Research on the application of multivariate and sequential statistical procedures in the biological assessment of water quality is described. Graphical presentation of bivariate statistical analysis was developed and found to be ideal for the interpretation of biologically based water quality data where two responses can be measured on the same experimental unit. A progress statement on the suitability of a graphical trivariate approach to assessing water quality is also presented. A technique for graphical display of R x 3 contingency tables was applied to the problem of detecting differences among aquatic communities with respect to functional biological groups and was found to be well-suited for visually inspecting such differences. Confidence interval estimation of White's measure of association between two categorical variables was developed and applied to an evaluation of fish movements in response to changing water quality. To facilitate the application of the Sequential Comparison Index (SCI), several procedures, based on statistical designs, are presented for sample selection and processing. Sequential statistical procedures were found to be a potentially time-and-cost saving technique for biologically assessing water quality; application of this technique with SCI data was shown to provide a rapid first approach to identifying station differences in species diversity. IN REGARD TO THE QUESTION OF THE DETERMINATION OF HEAVY METALS IN RIVER WATERS WITH THE AID OF RADIONUCLIDE X-RAY FLUORESENCE ANALYSIS, (IN GERMAN),
Staatliches Forchungsinstitut Geochemisches, Bamberg (West Germany).
H. Meier, E. Unger, W. Albrecht, D. Boesche, and W. Hecker.
Mikrochim Acta 5/6, p 505-518, 1975.

Descriptors: *Pollutant identification, *Heavy metals, Rivers, *X-ray fluorescence, Radioisotopes, Sediments, Suspended solids.

The fundamentals of energy-dispersive X-ray fluorescence analysis involving radioactive nuclide sources in combination with Si(Li) semiconductor detectors or proportional counter tubes are discussed. Examples are given to show that the procedure is suitable for the rapid determination of dissolved or suspended pollutants of river waters and sediments. Direct analysis of water samples and analysis of specimens without preliminary chemical treatment by evaporation or centrifugation are possible. Concentrations of 0.1 ppm are the detection limits.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: Rainfall, Model studies, Ions, Water analysis, *Pollutant identification, Water chemistry, Soil chemistry, *Absorption, Ecology, Precipitation(Atmospheric).
Identifiers: Rainfall chemistry, *Acid rainfall, Soil acidification.

Problems of measurement and interpretation of rainfall acidity in terms of effects on the soil-plan system are discussed. The theory of the carbon dioxide-bicarbonate equilibria and its effect on rainfall acidity is given. The relationship of a cation-anion balance model of acidity in rainfall to plant nutrient uptake processes is discussed, along with its relationship to a model previously proposed in the literature. Averagre H+ concentration calculated from pH measuremets does not appear to be a satisfactory method of determining H+ loading from rainfall if the rain is not consistently acid. Calculating loading from H+ minus HCO3 -, strong acid anions minus basic cations, or net titratable acidity is suggested. The flux of H+ ions due to plant uptake processes and sulfur and nitrogen cycling is considered. H+ is produced by oxidation of reduced sulfur and nitrogen compounds mineralized during decomposition of organic matter. Plant uptake processes may result in production of either H+ or OH-ions. Fluxes of H+ from these processes are much greater than rainfall H+ inputs, complicating measurement and interpretation of rainfall effects. The soil acidifying potential due to the oxidation of the NH4+ in rainfall is apparently of a similar magnitude to the direct acidity inputs. (EPA)

AUTOMATIC ORGANIC MONITORING SYSTEM FOR STORM AND COMBINED SEWERS,
Raytheon Co., Portsmouth, R.I.
A. Tulumello.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-242 142, $5.00 in paper copy, $2.25 in microfiche. Report EPA-670/2-75-067. June 1975. 69 p, 30 fig, 6 tab, 3 append. 68-03-0262. 1BB034ROAP 21-ASO Task 038.

Descriptors: Combustion, *Instruments, Recording instruments, Carbon dioxide, *Monitoring, Sampling, *Storm water, Organic wastes, Sewage, *Pollutant identification, Combined sewers.
Identifiers: Infrared, *Total organic carbon, Organic pollution, Combined sewage, Storm-related wastewaters, *Automatic monitoring.

Early in the program to develop a stormwater TOC (total organic carbon) system, it was established that continuous on-line TOC was the best method for the measurement of stormwater pollution loading. (See W76-00507). Hardware was assembled that would process stormwater samples containing high suspended solids and that would obtain a continuous signal proportional to the concentration of TOC in the sample. Synthetic samples of municipal raw influent charged with primary sludge were analyzed using the TOC analyzer. Data were also obtained on actual stormwater samples collected during storm events at Boston. Further modifications were made after these observations. Automatic circuitry designed to provide turn auto-zero, auto-span and sample line flushing was added to the hardware, and the system was installed at Boston Cottage Farm Storage Facility. Automatic continuous analyses were obtained

ng storms on site at the Cottage Farm Storage acility. (EPA)

entifiers: *Monroe County(Mich), *Hagman oad Sanitary Landfill(Mich).

t the Hagman Road Landfill refuse is buried in custrine and glacial till deposits consisting ainly of silty clays. These clays overlie a thick rbonate aquifer used locally for water supply. ie dominant direction of groundwater flow is rtically down. Time of groundwater travel from e refuse to the aquifer was estimated at 12 years, tting first arrivals in 1978. Water quality moniring of bedrock waters showed decreases in total ssolved solids, sulfates, calcium, magnesium, lorides, and total hardness with increases in alinity to exist locally beneath the landfill. The incipal chemical reaction felt to explain some, t not all, of the water quality changes is sulfate duction. Theoretical geochemical modellings lped to support this interpretation. The landfill is hypothesized to have either triggered or acelerated sulfate reduction by creating the reducg environment. (Gibb-ISWS)

PHOTOCHEMICAL SIDE REACTION THAT TERFERES WITH THE PHENOL-POCHLORITE ASSAY FOR AMMONIA,
lifornia Univ., Davis. Dept. of Food Science d Technology.
Gravits, and L. Gleye.
nnology and Oceanography, Vol. 20, No. 6, p. 5-1017, 1975. 3 fig., 5 ref.

scriptors: *Analytical techniques, *Ammonia, ea water, *Light, *Chemical reactions, Spectophotometry, Assay.
ntifiers: Phenolhypochlorite assay.

posure to sunlight of the reaction mixture for phenolhypochlorite assay for ammonia in seaer results in the formation of a compound tenvely identified as indophenol, the same comnd that is formed in the presence of ammonia. photochemical side reaction of reagent blanks le with distilled water results in a yellow oration within minutes. The solution than vly turns green with continued exposure to light. After an hour of exposure the absorbance hese solutions at 640 nm is typically between and 0.3 absorbance units. Similar color changes observed when assay mixtures containing amia standards in either distilled water or seaer are exposed to sunlight. The concentration he interfering compound increases with exled exposure and its formation ceases with the solution is removed from light. The interference reaction can be prevented by wrapping the sample containers with aluminum foil before adding reagents and by assuring that the sample is not exposed to sunlight while it is being transferred to the cuvette and placed in the spectrophotometer. It is also suggested that the nitroprusside reagent and phenol solution be protected against light exposure. It is possible, too, that artificial laboratory lighting may interfere with the assay. (Auen-Wisconsin).
W76-06712

THE ACID-BUBBLING METHOD FOR PRIMARY PRODUCTIVITY MEASUREMENTS MODIFIED AND TESTED,
Iceland Univ., Reykjavik. Science Inst.
P. Theodorsson, and J. O. Bjarnason.
Limnology and Oceanography, Vol. 20, No. 6, p. 1018-1019, 1975. 5 ref.

Descriptors: *Primary productivity, *Analytical techniques, *Laboratory tests, Carbon, Carbonates, Organic matter.
Identifiers: Acid-bubbling method.

When estimating the primary productivity by separating the C14-carbonate from newly assimilated C14-labeled organic matter by acidifying the sample and driving the carbon dioxide out with a stream of air, it was found that the C14 activity of the sample containing the labeled algae seemed to decrease even after all the C14-carbonate had supposedly been driven off. A study indicated that no activity was actually being lost from the bubbling vessel, but some of the algae were sticking to the wall of the Allihn tube, which would normally lead to an underestimation of primary productivity but could, in some cases, lead to a serious overestimation. By shaking glass vials, adding 5 ml of Insta-Gel to 5 ml of seawater, and bubbling the air through a hypodermic needle, the adhesion of the C14-labeled organic matter to the walls of the vessel was eliminated. The acid-bubbling method measures not only the C14 activity of labeled organic matter inside the algae but also organic matter excreted during normal metabolism of the cells. The 5-15% of the total C14 activity in the filtrate was measured and added to the activity of the filter. (Auen-Wisconsin).

TELEDETECTION BY AIRPLANE AND SATELLITE IN THE STUDY OF MARINE POLLUTION, (IN FRENCH),
Centre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Nice (France).
M. Aubert, J. P. Breittmayer, and Tan N'Guyen.
Rev Int Oceanogr Med 39/40, p 33-52, 1975.

Descriptors: *Remote sensing, *Aerial photography, Water pollution, *Pollutant identification, Satellites(Artificial).
Identifiers: *Teledetection, Marine pollution.

The use of aircraft and satellites gives new possibilities in the studies of marine pollutions. Aerial photography facilitates exploration of restricted areas with good precision, allowing direct computation of pollutant concentration. Documents transmitted by satellites in the 500-600 and 600-700 nm wavelength show sources and extent of pollution; diffusion of the most important pollutants can be analyzed on the photos. Combined use of these 2 methods of analysis of marine water bodies allows study of peculiar local situations and their consideration in a general hydrological context.--Copyright 1975, Biological Abstracts, Inc.

APPARATUS FOR THE IN SITU CONCENTRATION OF TRACE METALS FROM SEAWATER,
Environmental Research Lab., Narragansett, R.I.
E. W. Davey, and A. E. Soper.
Limnology and Oceanography, Vol. 20, No. 6, p. 1019-1023, 1975. 2 fig., 6 ref.

Descriptors: *On-site tests, *Sea water, *Trace elements, *Analytical techniques, Cadmium, Chromium, Copper, Iron, Manganese, Nickel, Lead, Zinc, Heavy metals.

An instrument designed to concentrate trace metals from seawater in situ and thereby reduce some potential sources of sample contamination is described and illustrated. It is arranged to sample at 10 cm from the sediment-water interface by attaching the filter and column directly to an anchoring cement block and at 0.5 m below the air-water interface by attaching filter and column directly to a water collection bottle. Intermediate depths could also be sampled by the addition of filter, column, tubing, and bottle assemblies. The bottles are suspended from a surface float so that they remain at the same immersion depth regardless of tidal cycles. This apparatus and grab sampling give comparable trace metal results with seawater samples in the laboratory; however field measurements vary especially in embayments, which are due to metal flux changes imposed by tidal cycles, intermittent anthropogenic metal inputs, or both. This apparatus could be applied to monitoring baseline trace metal levels, sewage and industrial metal outfalls, offshore dumping sites, and diffusion of heavy metals from polluted sediments. It could be adapted for monitoring other compounds such as methylated mercury, chlorinated hydrocarbons, amino acids, etc., by replacing the Chelex-100 in the columns with resins specific for the compound of interest. A PISTON CORER FOR PEAT,
Woods Hole Oceanographic Institution, Mass.
A. C. Redfield.
Limnology and Oceanography, Vol. 20, No. 6, p. 1042-1045, 1975. 3 fig., 4 ref.

Descriptors: *Sampling, *Muck soils, Peat, Cores, Lake sediments, Muds.
Identifiers: Piston corer.

An instrument is described which secures samples of peat or other soft sediments with minimal disturbance of structure, compression, or contamination by material from other depths. Its special virtue is the automatic control of the depth of sampling. It has been used to sample salt marsh peat from depths up to 25 ft, and by working through a hole in ice cover, 19 ft of soft lake sediments have been secured from under 27 ft of water. The construction and operation of the corer is diagrammed. The first core, extending from the surface to a 1 ft depth is cut by inserting the handle in the upper hole of the template to ensure that the piston remains immovable and forcing the core barrel downward to the limit of its excursion, when the upper end of the extension tube will correspond in position to the second hole of the template. The instrument is then withdrawn after tightening a setscrew. A second core, from 1 to 2 ft below the surface, is obtained after reinserting the corer into the hole; the process is repeated until five cores are obtained and may be continued to greater depths by the attachment of extension rods and tubes. Cores can be secured from any predetermined depth. Two instruments have been made to obtain cores of different diameter. Their construction and dimensions are shown. (Auen-Wisconsin)

STUDY OF THE STRONTIUM 90/STRONTIUM ISOTOPE BALANCE IN A LATVIAN LAKE, (IN RUSSIAN),
Akademiya Nauk Latviiskoi SSR, Riga. Inst. of Biology.

LIBRARY OF THE UNIVERSITY OF ILLINOIS

M. P. Leinerte, D. R. Vadzis, Z. K. Kalninya, and Y. Y. Sloka.
Ekologiya 5(5), p 77-79, 1974.

Descriptors: Lake, Strontium radiosotopes, Mud, Radioisotopes, Plankton, Seasonal, Spectrophotometry, Radioactivity, Pollutant identification, Aquatic plants.
Identifiers: Alburnus-Alburnus, Elodea-Canadensis, Equisetum-Limosum, Esox-Lucius, Nuphar-Luteum, Perca-Fluviatilis, Phragmites-Communis, Strontium-90, Typha-Latifolia, *USSR(Latvia), *Isotope balance(Lakes).

To study the isotope balance of the lake, the stable Sr level was determined by atomic absorption spectrophotometry and the Sr90 level was determined the oxalate Y90 separation techniques in Lake Engures of the Latvian SSR (USSR). Seasonal variations in these levels are observed. The higher the stable Sr level, the higher was the radioactive Sr in the water, plants and fish. Toward the end of the vegetation period, the levels of both isotopes increased in the lake water and plants, decreased in plankton, mud, and ichthyophagous fish and did not change in the sand or planktonophagous fish. The plants studies included Equisetum limosum, Phragmites communis, Typha latifolia, Nuphar luteum and Elodea canadensis. The fish studies were Alburnus alburnus, Perca fluviatilis and Esox lucius. The complete mexture of Sr and Sr90 had not yet occurred in this lake.--Copyright 1975, Biological Abstracts, Inc.

ON THE UNIVERSALITY OF THE POOLE AND ATKINS SECCHI DISK-LIGHT EXTINCTION EQUATION,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
S. B. Gilbert, and R. Gene.
J Appl Ecol. 11(1), p 399-401, 1974.

Descriptors: Ponds, Sewage, *Arizona, *Secchi disks, Equations, *Light penetration, Measurement.
Identifiers: *Light extinction equation, *Poole and Atkins equation.

On 26 clear days during the year April 1971-March 1972, K(extinction coefficient) and ZSD (Secchi disk depth) measurements were made in a small manmade pond filled with renovated sewage water of the Flushing Meadows reclamation project at Phoenix, Arizona. The results of the determinations of K, and ZSD at Flushing Meadows are plotted on a log-log scale, along with additional data. The Poole and Atkins equation possesses a universality that should provide a sufficiently accurate estimate of light extinction in all types of water for many biological studies lacking detailed light profile measurements.--Copyright 1975, Biological Abstracts, Inc.

THERMODYNAMIC LIMITATIONS ON THE USE OF THE PLATINUM ELECTRODE IN EH MEASUREMENTS,
M. Whitfield.
Limnol Oceanogr. 19(5), p 857-865, 1974.

Descriptors: *Thermodynamics, Estuaries, Electrodes, Hydrogen ion concentration, Oxygen, Measurement, *Estuarine environment, Oceans, *Oxidation - reduction potential, *Pollutant identification.
Identifiers: Plantinum electrodes.

The thermodynamic stability of surface oxide and sulfide coatings on the Pt electrode is considered. In well mixed environments thermodynamic considerations and experimental evidence suggest that the platinum surface acts as an oxide electrode that responds to pH rather than to O2 partial pressure. In stagnant conditions in the marine or estuarine environment the slow formation of Pt sulfide may push the measured Eh values to more negative potentials if permanently emplaced electrodes are used. These reactions may restrict the operational use of Eh measurements.--Copyright 1975, Biological Abstracts, Inc.

DETERMINATION OF PARTS PER BILLION SULFIDE IN WATER WITH THE SULFIDE-SELECTIVE ELECTRODE,
Du Pont de Nemours (E. I.) and Co., Aiken, S. C. Savannah River Lab.
E. W. Baumann.
Anal Chem. 46(9), p 1345-1347. Illus. 1974.

Descriptors: *Pollutant identification, *Electrodes, *Sulfides, Water analysis, Analytical techniques, Methodology.

The sulfide-selective electrode is well suited for the routine determination of total sulfide in water because of simplicity of measurement and absence of interferences. A procedure issued by Orion, with a sulfide antioxidant buffer of sodium salicylate ascorbic acid and sodium hydroxide, will determine sulfide contents as low as 0.1 ppm. This sensitivity was extended to 30 ppb by removal of heavy metals (identified as Cu and Cr) from the sodium salicylate by dithizone extraction. Because this sensitivity was still inadequate to determine sulfide concentrations in natural waters, a preconcentration step was incorporated to extend the determination to a lower ppb range. The sulfide was separated as ZnS, coprecipitated with Zn(OH)2, and subsequently dissolved in alkaline EDTA-ascorbic acid solution for potentiometric measurement with the sulfide-selective electrode. The procedure without the preconcentration step was used to determine higher concentrations of sulfide. --Copyright 1975, Biological Abstracts, Inc.

NEUTRON ACTIVATION ANALYSIS OF SOME OF THE BIOLOGICALLY ACTIVE TRACE ELEMENTS IN FISH,
Pennsylvania State Univ., University Park, Dept. of Nuclear Engineering.
K. K. S. Pillay, C. C. Thomas, Jr., and C. M. Hyche.
J Radioanal Chem. 20(2), p 597-606, 1974.

Descriptors: *Pollutant identification, *Trace elements, *Neutron activation analysis, *Lake Erie, Analytical techniques, Fish, Copper, Mercury, Cadmuim, Zinc, Chromium, Spectrometry.
Identifiers: Arsenic, Selenium.

Highly specific neutron activation analysis procedures involving post irradiation chemical separations were developed for the determination of (environmental pollutants) Cu, Hg, Zn, Cd, As, Se and Cr in fish tissues. The procedures developed were used to determine the levels of these biologically active elements in some of the commercially important fish species of Lake Erie. The nuclear analytical procedures developed generally involved the irradiation of fish tissues followed by wet-ashing in the presence of non-radioactive carriers. From the homogeneous solution of the tissue digest, the elements of interest were chemically isolated and the radioactivities were measured by scintillation gamma ray spectrometry. The results include both the determination of the precision and accuracies of each of these elemental analyses and a survey of these 7 elements in 9 major fish species of Lake Erie.--Copyright 1975, Biological Abstracts, Inc.

CHLOROPHYLL A CONTENT AS AN INDEX OF PERIPHYTON PRODUCTIVITY, EXEMPLIFIED BY LAKE KRASNOE, (IN RUSSIAN),
S. L. Basova.
Ekologiya 5(2), p 73-74, 1974.

Descriptors: *Chlorophyll, *Periphyton, Lakes, *Productivity, Biomass, Bioindicators, Ponds, Pollutant identification, Reeds, Seasonal.
Identifiers: Bulrush, Grass, *USSR(Lake Krasnoe).

Samples of periphyton were collected in the summer and fall of 1971 in Lake Krasnoe (Karelian isthmus (Russian SFSR, USSR). The periphyton biomass on different substrates was established and the content of chlorophyll a was determined spectrophotometrically. When considering chlorophyll a as an index of biomass it is important to know its relative content in Periphyton. It varied from 0.02-0.24% of fresh weight for periphyton of reedgrass, 0.10-0.33% for pondweed, 0.09-0.18% for bulrush and 0.02-0.56% for stones. On the assumption that the biomass expressed on a fresh weight basis is 10 times greater than the dry weight, the average relative content of chlorophyll in the periphyton of Lake Krasnoe is 1,2-1.7% of the dry weight of the periphyton.--Copyright 1975, Biological Abstracts, Inc.

THE DETERMINATION OF CARBOHYDRATES IN NATURAL WATERS: A COMPARISON OF PAPER CHROMATOGRAPHIC: COLORIMETRIC AND ENZYMATIC METHODS, (IN GERMAN),
Freiburg Univ. (West Germany). Limnologische Institut.
A. Geller.
Arch Hydrobiol Supplementb 47(3), p 295-324, 1975.

Descriptors: *Carbohydrates, *Chromatography, *Colorimetry, Enzymes, Analytical techniques, Assay, Pollutant identification.
Identifiers: Aphanizomenon, *Enzymatic method, Paper chromatography, Saccharide, Spaerotilus.

In limnology and oceanography estimation of carbohydrates is mainly done by paper chromagraph and colorimetric tests, e.g., the anthrone metho for determination of total hexoses. Paper chromatographic and colorimetric methods usually employed in limnology and other paper chromatographic, colorimetric and enzymatic assays were investigated and compared for sensitivity, specificity and applicability to carbohydrate analysis of natural waters. The carbohydrate content of Aphanizonmenon and Sphaerotilus were determined after acid hydrolysis as monosaccharide by these methods.--Copyright 1975, Biological Abstracts, Inc.

THE HEAVY METAL CONCENTRATIONS IN THE MARINE SEDIMENTS ALONG THE COAST OF FUKUYAMA, (IN JAPANESE),
Kagoshima Univ. (Japan). Marine Biology Lab and Kagoshima Univ. (Japan). Environment Sciences.
A. Inoue, and S. Asakawa.
Mem Fac Fish Kogoshima Univ 23, p 209-21 1974.

Descriptors: *Heavy metals, Coasts, *Sediment, Spectrophotometry, Pollutant identification.
Identifiers: Eutreptiella-sp, Exuviaella-sp, Heavy, *Japan(Fukuyama).

The heavy metal contents in the marine sedimen (Japan) were evaluated by atomic absorption spectrophotometry. The heavy metals ordinarily included 2400-3100 microgram/g of dried matter Fe, 280-790 for Mn, 8-21 for Co, 13-100 for Cu, 700 for Zn, 16-95 for Ni and 1.0-3.9 for Cd. definite difference was recognized for any met between the contents of the upper layer (0-5 from the surface) and those of lower layer (10 cm). The mean quantities of extractable hea metals in the marine sediments of this distr were: 2000 microgram/g of Fe/g of dried mat 280 of Mn, 6 of Co, 20 of Cu, 90 of Zn, 6 of Ni

of Cd. High concentration of extractable Fe and Mn suggested that the elution of those metals from marine sediments would constantly occur and maintain the long lasting blooms of dinoflagellates, such as Exuviaella sp. and Eutreptiella sp.--Copyright 1975, Biological Abstracts, Inc.

5B. Sources Of Pollution

APPLICATIONS OF LINEAR TIME SERIES MODELS AND STEPWISE REGRESSION MODELS TO SELECTED WATER QUALITY DATA ON THE CONNECTICUT RIVER,
Massachusetts Univ., Amherst. School of Health Sciences.
C. J. Gross, and R. C. Galkiewicz.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-251 557 $5.00 in paper copy, $2.25 in microfiche. Massachusetts Water Resources Research Center, Publication No. 37, November, 1973. Completion Report FY 74-4, 36 p, 2 fig, 15 tab, 6 ref, append. OWRT A-062-MASS(1).

Descriptors: *Time series analysis, *Regression analysis, *Model studies, *Connecticut River, Data collections, *Dissolved oxygen, *Coliforms, Forecasting, Estimating, Water pollution sources, Computer programs.
Identifiers: Autoregressive models, ARMA models, White noise models.

Each water quality data set for the Connecticut River is fitted by a linear time series model, undergoes a stepwise multiple regression, and has its residuals fitted by a linear time series model. All data sets including both original and residual data sets are fitted adequately by either an autoregressive model, an ARMA model, or a white noise model. Using these data sets it was possible to forecast future dissolved oxygen readings assuming conditions of continuity in the basin) at three sampling stations, as well as forecasting future coliform counts at two of these stations. The analyses show that all original data sets for which the white noise model is inappropriate are proportion saturated dissolved oxygen data sets. Furthermore, the tendency of proportion saturated dissolved oxygen appears downward in some years, e.g. 1962, but not always, e.g. 1963. An analysis of coliform counts could not be made because both original coliform data sets were fitted adequately by the white noise model. The pollution related independent variables which are most highly related to dissolved oxygen levels are pH and turbidity, though no strong relationship can be demonstrated.

SALINITIES OF AMBIENT AND INTERSTITIAL WATERS OF SOME MASSACHUSETTS NORTH SHORE SALT-MARSHES,
Massachusetts Univ., Amherst.
D. L. Merrow, and N. H. Nickerson.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-251 551 $3.50 in paper copy, $2.25 in microfiche. Completion Report, April 1975, 7 p, 10 ref. OWRT A-036-MASS(1).

Descriptors: *Salinity, *Groundwater movement, *Massachusetts, *Salt marshes, *Peat, Chlorides, Hydrogen sulfide, Gases, Test wells, Water pollution sources, Path of pollutants, Connate water, Pollutant identification.

The purpose was to determine whether selected salt marshes along the north shore of Massachusetts had any effect on retarding seaward flow of fresh ground water. The salt marshes on the North Shore are underlain mostly by loose black peat smelling strongly of H2S; below the peat at different depths is found dense Boston Blue clay. Both these soils are semipervious to impervious to water. Water samples from holes drilled in the marsh showed much variation in chloride content. The evidence indicated that ground water is slowed and to a measurable extent physically backed up by peat deposits in marshes over heavy clay as are found on the North Shore. These findings may be interpreted as evidence that where an impermeable or hard-pan layer occurs under a salt marsh, fresh ground-waters move seaward through the peats of the marsh only slowly, and that any natural openings such as cracks or man-made openings such as mosquito control ditches hasten this run-off. Slow water movement through the peat is amply demonstrated by the presence of H2S in unmistakable quantity; the anaerobic condition marked by the presence of this gas means no rapid penetration of oxygenated waters.

REGIONAL DISTRIBUTION OF THE MAJOR DISSOLVED SOLIDS IN THE STREAMS OF ILLINOIS,
Northern Illinois Univ., De Kalb. Dept. of Geology.
M. M. Nienkerk, and R. C. Flemal.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-251 554, $4.50 in paper copy, $2.25 in microfiche. Illinois Water Resources Center, Urbana, Research Report No. 109, February 1976. 56 p, 34 fig, 4 tab, 21 ref, 3 append. S-046-ILL.

Descriptors: *Dissolved solids, *Illinois, Streams, *Water analysis, *Distribution, *Regional analysis, *Path of pollutants, *Distribution patterns, *Water pollution sources, Strip mining, Wastes, Waste disposal, *Chemical wastes, Drainage basins.
Identifiers: *Stream water quality.

Using water analyses from 67 gaged streams in Illinois, the frequency-weighted mean concentration (mg/l) and the long-term yield (tons/sq mi/yr) were determined for the following dissolved constituents: iron, manganese, fluoride, boron, silica, phosphate, chloride, sulfate, nitrate, ammonium, calcium, magnesium, sodium, potassium, strontium, carbonate, alkalinity, total hardness, and total dissolved mineral content. Values obtained were used to construct contour maps of the magnitudes of each constituent. Most of the constituents are readily contoured, indicating that their magnitudes have regional consistencies, and are controlled by regional rather than local factors. Several constituents (phosphate, ammonium, potassium, and strontium) do not follow this pattern, and at least two (chloride and nitrate) have increased in magnitude with time. Constituents with strong regional patterns can be divided into groups based on the geographic location of high and low concentration/yield areas. In most cases explanations for the patterns can be found in regional patterns of geologic, hydrologic, and/or demographic conditions. Detailed and specific sources for individual constituents are difficult to delimit at this level of investigation. However, general considerations as to the relative importance of natural versus anthropogenic sources can be hypothesized in some of the more apparent cases. Among significant anthropogenic sources appear to be strip mining activity, introduction into--and subsequent fallout from--the atmosphere of soluble materials, use of fertilizers, disposal of industrial, domestic, and farm wastes, and street salting.

INFILTRATION OF ORGANIC PHOSPHATE COMPOUNDS IN SOIL,
California Univ., Davis. Dept. of Land, Air, and Water Resources.
D. E. Rolston, R. S. Rauschkolb, and D. L. Hoffman.
Soil Science Society of America Proceedings, Vol. 39, No. 6, p 1089-1094, November-December 1975. 6 fig, 19 ref.

Descriptors: *Infiltration, *Irrigation practices, *Soil types, *Fertilizers, *Phosphorus compounds, Leachate, Groundwater movement, Penetration, Soil properties, Phosphates, Nutrient removal, Phosphorus, Soil analysis, Evaluation, Soil chemistry, Soil bacteria, Soil moisture, Soil water, Organic compounds, Clay loam.
Identifiers: Organic phosphate compounds, Chemical fertilizers, Phosphorus placement, *Phosphorus fertilizers, Phosphatase enzyme, Panoche clay loam, Aiken clay loam, Glycerophosphate, Methyl ester phosphate, Glycol phosphate, Infiltrating solutions.

Organic phosphate compounds may be moved greater distances into soil than is possible with inorganic phosphates, inasmuch as organic phosphates must be enzymatically hydrolyzed to orthophosphate before soil reactions inhibit movement. The hydrolysis in solution and movement in soil of six organic phosphates were investigated in order to evaluate possible advantages of the compounds as fertilizers. The compounds studied were glycerophosphate, methyl ester phosphate, glycol phosphate, glycol phosphate, ethyl ester phosphate, glucose 1-phosphate, and glucose 6-phosphate. The infiltration of organic P compounds into Panoche clay loam soil and glycerophosphate into five soils differing in texture, clay type, organic matter, and pH and into one soil at three water contents was investigated by infiltrating organic P solution into columns of dry or moist soil at a rate of 66 kg of P/ha. Inorganic P concentration in bicarbonate extracts was measured as a function of soil depth at the termination of infiltration. The movement of P from organic compounds was compared with the movement of potassium phosphate. All the organic phosphates hydrolyzed at similar rates. The P from all the organic compounds moved to approximately the 12-cm depth in the calcareous Panoche clay loam soil with only slight differences in P concentration above that depth, whereas inorganic phosphate moved no more than 2-3 cm. The enzymatic hydrolysis rate of glycerophosphate and the resulting P distribution after infiltration was influenced by soil type. (Henley - ISWS)

A COMPARATIVE STUDY OF CHEMICAL LOADINGS OF ACID AND NON-ACID TRIBUTARIES OF CHEAT LAKE, WEST VIRGINIA,
West Virginia Univ., Morgantown. Dept. of Biology.
D. Edens.
Proceedings West Virginia Academy of Science, Vol. 1, p. 45-51, 1974. 4 tab., 14 ref.

Descriptors: *Chemical analysis, *Acid mine drainage, *Acid streams, *West Virginia, Discharge measurement, Hydrogen ion concentration, Specific conductivity, Silicates, Sulfates, Iron, Acidity, Phosphates, Nitrates, Nitrogen, Ions, Cations, Potassium, Surveys, Tributaries.
Identifiers: *Cheat Lake(W Va), Canyon Run(W Va), Sunnyside Run(W Va), Tower Run(W Va), Maple Run(W Va), Morgan Run(W Va), Cole's Run(W Va), Quarry Run(W Va), Rubles Run(W Va).

Acid stream loading was compared with non-acid stream loading in tributaries of Cheat Lake, West Virginia, using concentration and discharge measurements taken during June 1973-January 1974. Acid streams had low pH, high conductivity, high silicate, sulfate, total iron, total acidity, orthophosphate, and total phosphate concentrations, and low nitrate-nitrogen concentrations. Non-acid streams had a pH near neutrality, lower conductivity, and lower silicate, sulfate, total iron, total acidity, orthophosphate, and total phosphate concentrations. Acid streams had high loadings of sulfate, total iron, total acidity, orthophosphate, and total phosphate, lower nitrate-nitrogen loading, and contributed more ions to Cheat Lake. Acid mine drainage did not increase silicate loading. Streams receiving acid drainage had higher cation concentrations, except potassium, and greater ion concentrations and loadings per unit drainage area. Acid tributaries could be distinguished from non-acid tributaries by all parameters studied except nitrate-nitrogen concentration and loading, silicate loading, and potassium concentration. Maple Run and Quarry Run had been disturbed and were distinguished from other non-acid streams by drainage area concentrations and loadings. Loadings and concentrations per unit drainage area detect small differences in streams and may indicate disturbances in drainage basins undetected by concentrations or loadings alone. BIODETERIORATION OF NAVY INSECTICIDES IN THE OCEAN,
Civil Engineering Lab. (Navy). Port Hueneme, Calif.
H. P. Vind, and C. W. Mathews.
Available from the National Technical Information Service, Springfield, Va. 22161 as AD/A007 568 $3.50 in paper copy, $2.25 in microfiche. ONR Annual Report No. 4, January 1975. 13 p, 2 tab., 1 ref. ONR 1-0020.

Descriptors: *Biodegradation, *Insecticides, *Sea water, DDT, Chlorinated hydrocarbon pesticides, Microorganisms, Lepids, Solubility, Pesticide residues, Toxicity, Leaching, Laboratory tests, Water pollution control.
Identifiers: Limnoria tripunctata.

Based on previous studies concerning the biodeterioration of insecticides in the ocean, it was hypothesized that water insoluble chlorinated insecticides are transported in sea water primarily by being absorbed in the fatty cell membranes of microorganisms suspended in the water. According to the hypothesis, it is theorized that insecticides which are somewhat less fat soluble than DDT will not enter marine food chains as easily at DDT. Thus they would be less hazardous as DDT, but would be just as toxic and persistent. It is predicted that insecticides in sewage can be removed with microbial cells in a primary or secondary sewage treatment plant. To determine the validity of this hypothesis, matchsticks are impregnated with a chlorinated hydrocarbon insecticide or other chlornated compound, then tested to see if the chlorine-containing compounds are degraded or leached. The wood eating marine crustacean, Limnoria tripunctata, is used as the test organism. Also gas chromatography will be used to determine the presence of insecticides. Early tests have been inconclusive, because leaching is very slow. Relative rates of biodegradation, fat solubilities, and leaching of 26 different chlorinated organic insectides or related chlorinated compounds are being tested. (Buchanan-Davidson--Wisconsin)

N AND P DISTRIBUTION IN LAKE KINNERET (ISRAEL) WITH EMPHASIS ON DISSOLVED ORGANIC NITROGEN,
Israel Oceanographic and Limnological Research Ltd., Haifa; and Kinneret Limnology Lab., Tiberias (Israel).
C. Serruya, U. Pollingher, and M. Gophen.
Oikos, Vol. 26, No. 1, p 1-8, 1975. 7 fig, 4 tab, 26 ref.

Descriptors: *Nitrogen, *Phosphorus, *Nitrogen cycle, *Lake sediments, *Lake stages, Lakes, Ammonia, Nitrates, Denitrigication, Ammonification, Nitrogen compounds, Bottom sediments, Eutrophication, Limnology, Plankton, Anaerobic conditions.
Identifiers: *Dissolved organic nitrogen, *Lake Kinneret(Israel), Peridinium.

Fluctuations of the amounts of different forms of nitrogen and total phosphorus, and their distribution between lake water and plankton in Lake Kinneret in northern Israel are described. Distribution of N and P shows that the lake water is the largest pool of N while sediments are the main reservoir of P. The organic nitrogen originates from 3 sources: the watershed, the plankton and the sediments. During the 7-8 month anoxic period, a large amount of organic nitrogen is accumulated in the lake bottom. During the destratification and turnover period this deposited organic nitrogen undergoes rapid hydrolysis and causes a sudden increase in dissolved organic nitrogen. The rate of ammonification of the dissolved organic nitrogen in winter may have an important ecological role, as a delay may retard the Peridinium bloom. (Robinett-Arizona)

HORIZONTAL SPREAD OF WASTEWATER FIELD OVER CALM OCEAN SURFACE,
Montgomery (James M.), Pasadena, Calif.
J. L. Chao.
Journal Water Pollution Control Federation, Vol. 47, No. 10, p 2504-2510, October, 1975. 2 fig, 18 ref.

Descriptors: *Waste assimilative capacity, *Waste water disposal, *Oceans, *Effluents, Design criteria, Engineering, Water pollution effects, Pollutant identification, Flow characteristics, *Path of pollutants.

Discharge of waste water into the ocean by cities and industries demands effective dilution of the effluent for oxidation and assimilation of the waste. Because of the complexity of ocean outfall system designs, the problem of horizontal spread of waste water in the absence of ocean currents was analyzed, and design guidelines were established for the praticing engineer. Since the primary purpose of the paper was to provide a simple method for estimating the dilution resulting from horizontal spread, flow characteristics were simplified and assumptions were made. It was pointed out that the subsequent dilution resulting from horizontal spread is relatively low in magnitude in comparison with the initial dilution that the effluent buoyant plume receives. (Loustau-FIRL)

CHLORINATION IN DILUTE AQUEOUS SYSTEMS; 2,4,6-TRICHLOROPHENOL,
Waterloo Univ. (Ontario). Dept. of Chemistry.
J. G. Smith, S. Lee, and A. Netzer.
Environmental Letters, Vol. 10, No. 1, p 47-52, 1975. 1 tab. 10 ref.

Descriptors: *Chlorination, *Chemical reaction, *Phenols, Analytical techniques, Pollutant identification, Water pollution sources.
Identifiers: Chloroform.

In order to elucidate the effects of chloroform on phenols, 2,4,6-trichlorophenol in dilute aqueous solution was treated with hypochlorous acid at pH 3.5 to pH 6. Reaction products were extracted from solution and examined by thin layer chromatography. The individual isolated components were characterized by their infra-red, nmr, and mass spectra. The principal products of the reaction were 2,4,4,6-tetrachloro-2,5-cyclohexadienone (A), and 2,6-dichloro-p-benzoquinone (B). Their identification was based on their spectra and was confirmed by mixture melting point with authentic samples. The possibility of the interconversion of A and B was investigated by treating each of these compounds with hypochlorous acid but it did not occur. Instead, an unindentified material characterized by a carbonyl frequency of 1800 c/m was formed. A number of minor products were also formed. The material balance in the experiments was low, with approximately 50% of the organic material remaining in the aqueous layer being lost by volatilization. Recovery of the organic products from the chromatographic column was also low. In part, this loss appears due to photolytically induced decomposition of the chlorinated products. Hypochlorous acid produced non-phenolic products by oxidation and by the addition of chlorine and/or hypochlorous acid to the aromatic ring. Although the toxicological properties of these polychlorinated species are unknown, chemical separations of chlorination reaction products should be employed with caution. (Loustau-FIRL)

Descriptors: *Nutrient removal, *Soils, *Phosphates, *Sorption, Laboratory tests, Septic tanks, Soil mechanics, Waste water treatment, Environmental effects.
Identifiers: Soil saturation.

The capabilities of six widely different Connecticut soils to sorb phosphate was studied in laboratory tests. Samples of the soils were suspended in phosphate solutions and their saturation times were measured. With that information the traveling time of the phosphate in the soils was calculated. Soil cores of the six soils were then leached with phosphate solutions on a weekly basis for two years. It was found that because of the great variance in sorption capacities, the saturation time requirements varied greatly. Over time the soils did not become fully saturated, suggesting that the soils were regenerated. These observations were substantiated by field studies around septic tank drainfields, one of which had been in operation for 5 years and still showed sorption capabilities. In addition, treatment of acid oils with waste water was found to increase their pH, thereby increasing their CEC and capacity to remove cationic pollutants from waste water. Thus it was concluded that soils around septic tank systems can remove phosphate effectively and for an indefinite length of time. (Loustau-FIRL)

TRACE ELEMENT CONCENTRATIONS OF SEWAGE TREATMENT PLANT EFFLUENTS AND SLUDGES; THEIR INTERACTIONS WITH SOILS AND UPTAKE BY PLANTS,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
A. R. Bradford, A. L. Page, L. J. Lund, and W. Olmstead.
Journal of Environmental Quality, Vol. 4, No. 1, p 123-217, January/March, 1975. 1 fig, 8 tab, 18 ref.

Descriptors: *Sludge disposal, *Trace elements, *Soil contamination effects, Treatment facilities, Effluents, California soil analysis, Toxicity, Water pollution effects, Waste water(Pollution).
Identifiers: Sludge toxicity.

The variety and concentrations of trace elements in effluents and sludges from certain metropolitan areas were identified and their interactions with soils and effects on plant growth were evaluated. Seven secondary treatment plants in southern California were selected for bimonthly analyses of the effluent over a 10-month period. The concentrations of Cu, Zn, Ni, Co, and Cd were consistently higher in the sludge samples than those obtained in ordinary California soils. Analysis of barley, bean, and tomato plants grown in sand culture and irrigated with aqueous sludge extracts was done to demonstrate the variabilty of absorption of different elements from sludge sources. Excessive and often toxic concentrations of B, Cu, Mo, Ni, Co, and Cd were found when compared to the concentrations in the control plants irrigated with a complete nutrient solution. Variabilities of different elements from different sludge are presented in a table. (Loustau-FIRL)

REVIEW OF HEATED DISCHARGE MANAGEMENT AND CONTROL ALTERNATIVES, ONCE-THROUGH SYSTEMS IN LARGE WATER BODIES.
Maclaren (James F.) Ltd., Willowdale (Ontario).
Environmental Protection Service, Environment Canada, Ottawa, Canada, Economic and Technical Review Report EPS 3-WP-75-4, December 1975, 161 p., 14 fig, 12 tab, 214 ref.

Descriptors: *Thermal powerplants, *Temperature control, Powerplants, Intakes, Environmental effects, *Reviews, *Thermal pollution.
Identifiers: *Heated discharges, Cooling systems.

A review is presented of current literature and non-Canadian legislation dealing with heated discharges from thermal power plants. Management and control alternatives are discussed, with particular reference to the problems associated with once-through cooling systems discharging into large water bodies. Topics discussed include the environmental effects of cooling systems, alternative designs for intakes and cooling systems, methods for the prediction and monitoring of environmental effects of heated discharges, and research needs. Past and existing standards and regulations for temperature control in other countries are critically reviewed. Recommendations are made concerning the selection of power plant sites, pre-operational surveys, the development of criteria for heated discharge regulation, intake and outfall design, and alternative cooling systems. A MODEL TO PREDICT THE PERFORMANCE OF FEEDLOT RUNOFF CONTROL FACILITIES AT SPECIFIC OREGON LOCATIONS,
Oregon State Univ., Corvallis. Dept. of Agricultural Engineering.
R. B. Wensink, and J. R. Miner.
Transactions of the American Society of Agricultural Engineers, Vol. 18, No. 6, p 1141-1146, November-December 1975. 3 fig, 6 tab, 6 ref. OWRT A-028-ORE(Z) EPA R-803819-01-0.

Descriptors: *Model studies, *Storm runoff, *Agricultural runoff, *Weather data, *Farm wastes, *Oregon, Water pollution sources, *Feed lots, Detention reservoirs, Water pollution control, Organic wastes, Rainfall-runoff relationships, Precipitation(Atmospheric).
Identifiers: Runoff curve number, Sufficient design method.

A computer simulation model was developed which can be used to size feedlot runoff retention basins based upon previous climatological records. The model simulated a feedlot surface onto which precipitation falls and runoff results. Weather data from three unique climatological regions were used in the model to evaluate feedlot pollution control designs in Oregon. The sufficient design method was used to determine minimum storage volume required to prevent illegal discharges as defined by EPA Effluent Guidelines. This technique demonstrated that to use design procedures based upon a factor times the 10 yr-24 hr or the 25 yr-24 hr storm leads to designs that are either unreasonably expensive or would lead to illegal discharges. The model was used to determine pollution control performance with various combinations of pumping rates and storage facility volumes. (Lardner - ISWS)

WASTEWATER DISPOSAL BY SUBMERGED MANIFOLDS,
Miljoplan, Hovik (Norway). Water Pollution Section.
P. Liseth.
Journal of Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY1, Proceedings Paper 11839, p 1-14, January 1976. 8 fig, 13 ref, 1 append.

Descriptors: *Path of pollutants, *Hydraulic design, *Hydraulic models, *Hydraulic structures, *Outlet works, Outlets, Outfall sewers, Diffusion, Waste dilution, Discharge(Water), Orifices, Hydraulics, *Waste water disposal, Laboratory tests, Mixing.
Identifiers: Manifolds, *Submerged orifices, Diffusors, Submerged manifold.

Jet mixing from submerged manifolds for wastewater disposal was studied by means of hydraulic model experiments. The experimental results showed that the dilution and flow pattern of buoyant jets from a manifold in stagnant receiving water of uniform density is altered if merging of the jets takes place. The ratio between vertical distance y above the manifold to the distance L between the ports along the manifold was found to be determining for the effects of merging. For values of y/L between 0-5, no significant differences in the center dilution was observed as compared to that of a single jet. For y/L greater than 5, the jets gradually merged into a two-dimensional plume over the manifold, causing a rapid reduction in the center dilution. For a given discharge load per length of manifold a port spacing y/L from 5 to 10 will result in the highest center dilution of the jets. (Morris-ISWS)

NITRATE MOVEMENT AND ITS DISTRIBUTION IN THE SOIL PROFILE OF DIFFERENTIALLY FERTILIZED CORN WATERSHEDS,
Agricultural Research Service, Cheyenne, Wyo.
G. E. Schuman, T. M. McCalla, K. E. Saxton, and H. T. Knox.
Soil Science Society of America Proceedings, Vol. 39, No. 6, p 1192-1197, November-December 1975. 4 fig, 2 tab, 20 ref.

Descriptors: *Nitrates, *Fertilizers, *Soil profiles, *Soil water movement, *Ion transport, *Iowa, Analytical techniques, Inorganic compounds, Leaching, Nutrient removal, Water pollution sources, Path of pollutants, Water quality, Nitrogen, Soil analysis, Irrigation effects, Soil tests, Percolation, Groundwater, Root zone, Agriculture, Loess, Contour farming, Corn(Field), Agricultural watersheds.
Identifiers: Nitrate movement, Chemical fertilizers, Anhydrous ammonia, Ammonia nitrate.

Nitrate movement within the 6.1-m soil profile of a watershed in southwestern Iowa, fertilized at 448 kg N/ha per yr, resulted in a 720-kg/ha increase in NO3-N below the corn root zone during the 3-year study. The NO3-N concentration of the baseflow from the watershed increased during this period, indicating that some of the leached NO3-N reached the groundwater. The watershed fertilized at the recommended N rate (168 kg/ha per yr) did not increase the quantity of NO3-N below the corn root zone; however, some NO3-N leaching did occur. Between April 1971 and April 1974, the accumulation of NO3-N in the profile of the excessively fertilized watershed moved from the 1.0- to 3.1-m depth. The watershed fertilized with 168 kg N/ha per yr did not show any zones of significant NO3-N accumulation in the soil profile at any of the sampling dates. The depth to the water table on the lowest contour sampled on the excessively fertilized watershed was 4.6 and 4.9 m in April 1973, and April 1974, respectively. The average NO3-N concentration for these two sampling dates at the water table depth increased from 3.7 to 12.9 ppm. The average NO3-N concentration at the water table depth on the normally fertilized watershed was 2.0 and 4.5 ppm in April 1973 and April 1974,

respectively, with a water table depth of 3.0 m. (Henley t ISWS)

TRANSIENT WATER QUALITY MODELING IN STREAMS,
Cornell Univ., Ithaca, N.Y. School of Civil and Environmental Engineering.
R. Willis, D. R. Anderson, and J. A. Dracup.
Water Resources Bulletin, Vol. 12, No. 1, p 157-174, February 1976. 4 fig, 1 tab, 17 ref.

Descriptors: *Water quality, *Management, *Simulation analysis, *Nitrogen cycle, Environmental engineering, Planning, Streams, Canals, Dissolved oxygen, Systems analysis, Mathematical models, Equations, *California.
Identifiers: Finite difference approximation, Mass transport equations, *Truckee River(Cal), Transient conditions.

A general planning model for simulation of water quality in streams and canals is formulated and verified. The model simulates the temporal and spatial variations in conservative and nonconservative constituents. The nitrogen cycle and its interaction with other nutrients and the dissolved oxygen resources of the stream are included. A fully implicit finite difference approximation is used to solve the mass transport equations describing variations in constituent concentrations throughout the stream systems. The model is applied to the Truckee River in northern California. Results indicate the applicability of the model for assessing the impact of alternative water quality management strategies on the stream systems. (Bell-Cornell)

Identifiers: *Dade County(Fla).

During 1971-74, the U. S. Geological Survey investigated the chemical, physical, bacteriological, and virological characteristics of the groundwater in five areas serviced by septic tanks in Dade County, Florida. Samples were collected from wells ranging in depth from 10 to 60 ft. Some enrichment of groundwater with sodium provided a possible key to differentiating septic-tank effluent from other urban groundwater contaminant sources. High ammonia nitrogen, phosphorus, and the repetitive detection of fecal coliform bacteria were characteristic of two 10-foot monitor wells that consistently indicated the presence of septic-tank effluent in groundwater. Fecal coliform bacteria were present on one or two occasions in many wells but the highest concentration, 1,600 colonies/100 ml, was related to storm-water infiltration rather than septic-tank discharge. The groundwater in the more permeable limestone in south Dade County near Homestead contained low concentrations of septic-tank related constituents. In north Dade County, where the aquifer is less permeable, groundwater contained the highest dissolved iron, manganese, COD, and organic carbon. (Woodard-USGS)

Identifiers: *Idaho National Engineering Laboratory, *Waste ponds.

The influence of liquid radioactive and chemical waste disposal is described for the Snake River Plain aquifer at the Idaho National Engineering Laboratory (INEL). In 1971 to 1973, an average of 237 water samples were collected annually, and an average of 600 chemical and radiometric determinations was made annually. An annual average of 817 water-level measurements was made in wells to determine the relations of water-level fluctuations to the movement of wastes. The 25 INEL production wells pumped an annual total of 2.5 billion gallons of water during 1971 to 1973. About 50% of this pumpage was returned to the aquifer. The Test Reactor Area utilizes ponds and a deep well to dispose of about 400 million gallons of dilute wastes per year. About half of the liquid waste is discharged to a radioactive waste pond. Infiltration from the ponds has formed a large perched-water body in the basalt. The perched groundwater body contains tritium, chromium-51, cobalt-60, and strontium-90. The extent and concentration of these radionuclides are shown on maps. A chemical processing plant discharges low-level radioactive waste and chemical waste directly to the Snake River Plain aquifer through a 600-foot disposal well. The distribution of waste products in the Snake River Plain aquifer covers about 15 square miles. Since disposal began in 1952, the wastes have migrated about 5 miles downgradient from discharge points. (Woodard-USGS)

THE EFFECT OF LAND USE ON THE CHEMICAL AND PHYSICAL QUALITY OF SURFACE AND GROUND WATERS IN SMALL WATERSHEDS,
Massachusetts Univ., Amherst. Dept. of Plant and Soil Sciences.
M. E. Weeks.
Available from the National Technical Information Service, Springfield, Va., as PB-251 890, $3.50 in paper copy, $2.25 in microfiche. Massachusetts Water Resources Center, Amherst, Publication 41, Completion Report 74-7, September 1974. 9 p, 2 tab, 4 ref. OWRT A-040-MASS(1)

Descriptors: *Land use, *Massachusetts, Small watersheds, *Water pollution sources, *Nitrates, *Phosphates, Farm wastes, Domestic wastes, Fertilizers, Water quality, Surface waters, Groundwater, Organic matter.
Identifiers: *South River watershed(Mass).

Results obtained from monitoring surface and ground waters gave only a qualified answer to the question of how to obtain some initial estimate of the effects of different land use patterns on water quality in the small watershed used (South River watershed - part of the Deerfield River and Connecticut River systems). This river is about 15 miles in length and has five named tributary brooks and numerous lesser part-time streams draining the watershed of approximately 16,400 acres. Agricultural wastes come largely from manure produced by the nearly 1100 head of cattle on the farms in the area, and from crop residues and, to a lesser extent, from fertilizers used. The houses of residence, including those in Ashfield and Conway centers, contribute most of the effluents from septic tanks and considerable raw sewage directly to the South River. Eight stations were located at different places along the stream water samples from the river at each of these stations were taken on a monthly basis for analysis. Low ground water phosphate concentrations were always found in lysimeters located in an area of the watershed where different soil management practices could be studied. No evidence of leaching was found from three field sites receiving moderate to sometimes heavy applications of manure and fertilizers. Laboratory and field studies with suction lysimeters on nitrate concentrations in water conclusively show that in many soil situations most of the nitrate-nitrogen not utilized by the crop is lost by denitrification rather than by leaching. The presence of high levels of active organic matter supplied in high application rates of manure are conducive to rapid denitrification.

Available from the National Technical Information Service, Springfield, Va. 22161 as PB-240 15 $5.00 in paper copy, $2.25 in microfiche. Technical Report 60. October 1974. 94 p, 45 tab, append.

Descriptors: Water quality control, *Eutrophication, Industrial wastes, *Nitrates, Sewage treatment, Water pollution sources, *Nutrient removal, Nitrogen compounds, *Phosphorous compounds, *Water assimilative capacity, *Chesapeake Bay, Water pollution effects, Water pollution treatment, Pennsylvania, Maryland.
Identifiers: Non-point sources, Point source control, *Susquehanna River Basin, Nutrient loading, Northumberland(PA), Conowingo(MD).

Progressive eutrophication of the Chesapeake Bay resulting from discharge of nitrogen and phosphorous in the Susquehanna River between Northumberland, PA, and Conowingo, MD, prompted the EPA to initiate a comprehensive study of the river and to develop a nutri-

management program. Comprised of monitoring and sampling of stream stations and sewage treatment plants, the study developed the following objectives: identification of nitrogen and phosphorous loadings, determination of seasonal variations in loadings; delineation of point and non-point sources; determination of loading rates from agricultural, forestry and urban areas; seasonal mass balance of loadings; and determination of phosphorous 'sinks' resulting from impoundments. Results are presented of data analysis and interpretation utilizing regression analysis to establish relationship between both nutrient concentration and loading versus stream flow. Even with point source phosphorous control, impacts from expected population growth will require consideration of non-point source control as well as high degree of phosphorous and nitrogen removal at point sources. Hopefully, management agencies will utilize these data and expand upon them to develop land use management programs in conjunction with point source control of nutrients. Future studies recommended included fertilizer application studies, significance of construction industry as a non-point source, and determination of non-point sources in urban runoff. A literature review discloses contradictory conclusions as to the extent agricultural runoff contributes to water and air pollution. To investigate the actual and potential importance of agricultural runoff, a study is described which was conducted at the West Virginia University-Morgantown as a basis for a mathematical model to characterize the surface runoff and tile drainage from a small agricultural watershed, including the interrelationships between soil types, hydrologic, climatologic, and pollution indices. Measurements included rainfall, runoff, sediment, organic matter, nutrients, and bacterial densities carried to the stream from surface and subsurface runoff. The predictive model, based on the Universal Soil Loss Equation and regression analysis, held well for the data collected, except for the winter months. The model has a much wider use because it takes into consideration most of the factors thus far identified as affecting the quality of agricultural runoff. Although the constant 'K' in the model related the total-nitrogen, total phosphorus, and COD to sediment, and is specific to this watershed, it can be estimated from soil fertility data and enrichment ratios for other watersheds. It is concluded that erosion rather than fertilizer is a major contributor of pollutants to surface waters although indiscriminate fertilizer use will also be a contributing factor. (Auen-Wisconsin).

Identifiers: *Sewage sludge dispersal, Coastal waters, *Silver, *Delaware Bay.

Sewage sludge from the municipal plants of Philadelphia, Pennsylvania, and Camden, New Jersey, has been dumped some 12 miles off the mouth of the Delaware Bay from 1961 to 1972 in amounts averaging 389,340 m3/year. Since 1973 the disposal area has been moved some 40 miles off-shore. Assays of silver and zinc in bottom sediments surrounding the Philadelphia dump site were employed to disclose the possible dispersion of sewage sludge. These trace metals are highly concentrated in the secondary treated sewage sludge from the Philadelphia metropolitan area, and display sensitive indications as tracers for the bottom dispersal of the sludge off the mouth of Delaware Bay. From such metal distributions, it is fair to conclude that the sludge has moved out of the former designated area of disposal some tens of miles shoreward, toward the west. A possible link between the sludge and a food web is implicated. (NOAA)

Descriptors: *Sewage sludge, *Sludge, *Sewage disposal, *Sludge disposal, *Waste disposal, *Ammonium compounds, Sampling, Water pollution, Water treatment, Phytoplankton, Waste dumps, New York.
Identifiers: *Ammonium concentrations, *New York Bight Apex, Dump sites, Parachute drogues, Water columns, Water bottom concentrations, Marine life.

Water column ammonium concentrations were determined at several stations at or near the sewage sludge dump site in the New York Bight apex on 30 and 31 July, 1973 and also at several stations located on a perimeter surrounding the dump area. Parachute drogues were used to track the movement of water over a 31-hour period. Within the dump site, ammonium concentrations weremicro matchy and usually increased from surface to bottom with concentrations in the ranges of less than 1UM and 1-9 micro m, respectively. However, at one station that had recently received sludge input, the surface ammonium concentration was over 500 micro m and the bottom concentration was about 200 micro m. All except two background stations showed no significant vertical variation in ammonium. The observations suggest that sludge dumping increases ammonium content of the water column, but that high levels probably do not persist for long periods. (NOAA)

Identifiers: Submerged-diffuser discharges, *Waste heat, *Thermal plume, D.C. Cook plant(Mich), Prototype data, Model predictions.

The Donald C. Cook Nuclear Plant at Bridgman, Michigan, uses submerged-diffuser discharges as a means of disposing waste heat into Lake Michigan. This report presented preliminary results of temperature surveys of the thermal plume at the D. C. Cook Plant. Indications are that the spatial extent of the plume at the surface is much smaller than previous results for surface shoreline discharges, particularly in the near and intermediate portions of the plume. Comparisons of limited prototype data with hydraulic (tank)-model predictions indicated that the model predictions for centerline temperature decay at the surface are too high for the initial 200 m from the discharge, but are generally correct beyond this point to the limits of the model. In addition, the hydraulic-model results underestimate the areal extent of the near and intermediate portions of the plume at the surface. Because this is the first report of a new field program, several inadequacies in the field-measurement techniques were noted and discussed. New techniques that have been developed to remedy these deficiencies, and which will be implemented for future field work, were also described. (Morris - ISWS)

THE RATE OF SPREAD OF FUEL OIL NO. 1,
Geological Survey of Sweden, Stockholm.
B. Sellberg.
Nordic Hydrology, Vol. 6, No. 1, p 63-72, 1975. 8 fig, 3 ref.

Descriptors: *Water pollution, *Groundwater, *Oil spills, Oil pollution, Groundwater movement, Sands, Soils, Oil, Soil contamination, On-site investigations, Analytical techniques, Pollutants, Pollutant identification, Path of pollutants.
Identifiers: *Oil movement in soils.

Experiments have been made in the field to determine the way in which fuel oil No. 1 spreads in some common unconsolidated deposits in Sweden, such as esker material, bottom varves of

glacial clay and sand on clay. In the investigations, the velocity of fuel No. 1 in reasonably homogeneous medium sand with a good groundwater flow was found to be 1.0-1.6 m/day, but usually the velocity was as low as 0.1-0.2 m/day. Experiments covering a longer period showed that the maximum concentration diminished very much in transport up to a distance of about 20 m. (Sims-ISWS)

PHOSPHORUS SOURCES FOR THE LOWER MADISON LAKES,
Wisconsin Univ., Madison. Water Chemistry Lab.
W. Sonzogni, and G. F. Lee.
Wisconsin Academy of Sciences, Arts and Letters, Vol. 63, p. 162-175, 1975. 1 fig., 12 tab., 19 ref. EPA 16010EHR.

Descriptors: *Phosphorus, *Lakes, Wisconsin, Agricultural runoff, Urban runoff, Land use, Precipitation(Atmospheric), Fallout.
Identifiers: *Madison(Wis), *Phosphorus sources, Lake Monona(Wis), Lake Mendota(Wis), Lake Waubesa(Wis), Lake Kegonsa(Wis), Yahara River(Wis).

The soluble orthophosphate and total phosphorus loading to and outflow from the lower of the chain of lakes (Monona, Waubesa, and Kegonsa) in Madison, Wisconsin are estimated to determine the effect of diversion of sewage effluents. The largest phosphorus source to these lakes is the Yahara River; i.e., for each of the lower lakes the outflow from the higher lake in the chain is the principal source. In contrast, the headwater Lake Mendota, with a much larger drainage basin, receives most of its phosphorus input from rural runoff. Rural runoff is the second most important phosphorus source to Lakes Waubesa and Kegonsa, but loading estimates are much lower than the pre-diversion estimates. Despite the reduction in the phosphorus loading, these lakes are still highly eutrophic. Urbanization within the Lake Mendota watershed is projected to double by 1900, nevertheless the increase in phosphorus loading would be small compared to the total load dominated by the Yahara River. The effect of urbanization would be significant, however, if new urban areas were at one time marshes. It is estimated that southeastern Wisconsin marshes could yield on the order of 45 kg of phosphorus/ha upon drainage. (Auen-Wisconsin)

DEGREE OF POLLUTION OF THE SAINT LAWRENCE RIVER FROM REPENTIGNY TO MONTMAGNY, (IN FRENCH),
Laval Univ., Quebec. Departement des Vivres.
J. G. Noel, and R. E. Simard.
Nat Can (Que) 102(2), p 199-208, 1975.

Descriptors: *St. Lawrence River, *Canada, *Bacteria, Microbiology, Coliforms, Streptococcus, Water quality standards, *Path of pollutants, Bioindicators, Wastes, Molds, Yeasts.
Identifiers: Montnagny, Ontario, Quebec, Repentigny.

The microbial water pollution level of the St. Lawrence River between Repentigny and Montmagny (Quebec, Canada) was studied from June-Sept. 1971. This area was divided into 31 sampling stations and averages of 450,000 total bacteria, 1100 total coliforms, 200 fecal coliforms, 45 fecal streptococci and 1300 yeasts and molds were found per 100 ml of water. These groups of microorganisms are the principal indicators of microbial contamination of water from domestic, human, animal, agricultural and industrial wastes. The results obtained from this microbiological survey, compared to those obtained from the Great Lakes and from the International Section of the St. Lawrence River and to the water quality criteria and Canada and Ontario, showed that a high level of microbial contamination occurs in the St. Lawrence River. The highest polluted stations were those of Sorel, Trois-Rivieres, Quebec and the north channel of the River at the Orleans Island. (See also W76-06735)--Copyright 1975, Biological Abstracts, Inc.

DEGREE OF POLLUTION OF THE SAINT LAWRENCE RIVER FROM REPENTIGNY TO MONTMAGNY: II. BIOCHEMICAL POLLUTION, (IN FRENCH),
Laval Univ., Quebec. Departement Des Vivres.
J. G. Noel, and R. E. Simard.
Nat Can (Que) 102(2), p 209-218, 1975.

Descriptors: *St. Lawrence River, *Canada, *Biochemistry, *Path of pollutants, Nitrates, Nitrogen, Chemical oxygen demand, Wastes, Bioindicatory, Phosphates.
Identifiers: Ammonia nitrogen, Quebec, Repentigny, Montmagny.

The biochemical water pollution level of the St. Lawrence River studied from Repentigny to Montmagny (Quebec, Canada) during June-Sept. 1971. This area covered was divided into 31 sampling sections and the mean results in mg/liter were 0.522 organic nitrogen (Keljdahl-nitrogen), 0.280 ammonia nitrogen, 0.515 nitrate, 0.061 orthophosphate, 21.3 chemical 02 demand. These compounds are the principal indicators of biochemical water pollution from domestic, agricultural, animal and industrial wastes. The results obtained which were compared to those from the Great Lakes, the International Section of the St. Lawrence River and to the water quality criteria in Canada and Ontario show that a high level of pollution occurs in the St. Lawrence River, particularly near Repentigny, Tracy, Trois-Rivieres, Donnacona, Quebec and the North and South Brance of the River at the Orleans Island. THE WINTER DISTRIBUTION OF ULTRAVIOLET ABSORPTION IN THE SURFACE WATERS OFF THE WEST COAST OF THE BRITISH ISLES,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
P. Foster, and A. W. Morris.
Environ Pollut. 7(2), p 121-132, 1974.

Descriptors: *Salinity, Coasts, Oceans, *Ultraviolet radiation, Measurement, *Path of pollutants, *Organic matter, Estuaris, *Distribution, Water pollution, Absorption, Surface water.

Concurrent measurements of salinity and the integrated UV absorption in the wavelength range 250-350 nm were made in the surface waters of Beaumaris, Cardigan and Liverpool Bays during the winter. Organic matter derived from land drainage rather than that produced by in situ biological activity controlled the magnitude of the absorption. The high absorptions recorded in Liverpool Bay were principally attributed to greater fluvial discharge rather than to absorption enhancement from polluted sources. It was not possible to distinguish spectrally any contribution to the dissolved organic matter from industrial or domestic sources. The increase in absorption caused by a decrease of 1‰ in salinity was greater in Liverpool Bay than in Cardigan Bay, principally as a result of the relatively high concentrations of dissolved UV absorbing organic matter in waters adjacent to the river Mersey estuary.--Copyright 1975, Biological Abstracts, Inc.
W76-06739

SEASONAL DISTRIBUTION OF ULTRAVIOLET ABSORPTION IN THE SURFACE WATERS OF LIVERPOOL BAY,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
P. Foster, and A. W. Morris.
Estuarine Coastal Mar Sci. 2(3), p 283-290, 1974.

Descriptors: Seasonal, *Distribution, *Salinity, Surface water, *Organic matter, *Ultraviolet radiation, Estuaries, *Path of pollutants, Bays, Water pollution, Absorption, Rivers.
Identifiers: Liverpool Bay(England).

Concurrent measurements of saliniity and the integratd UV absorption in the wavelength range 250-350 nm were made in the surface waters of Liverpool Bay (England) during 4 cruises conducted in Sept. and Dec. 1970 and March and July 1971. Except during Sept. the distribution and magnitude of the UV absorption were predominantly influenced by organic matter introduced from land sources rather than by in situ biological activity. Highest values of ultraviolet absorption consistently occurred adjacent to the estuariew of the River Mersey and River Ribble. Waters from the River Mersey were organically 'dirty' relative to all other freshwater sources in the area.--Copyright 1975, Biological Abstracts, Inc.

NITRATES IN KANSAS GROUNDWATERS AS RELATED TO ANIMAL AND HUMAN HEALTH,
Kansas State Univ., Manhattan. Comparative Toxicology Lab.
W. E. Ridder, F. W. Oehme, and D. C. Kelley.
Toxicology. 2(4), p 397-405, 1974.

Descriptors: Nitrates, Kansas, Animal diseases, Human diseases, Water wells, Groundwater, Water pollution sources, Potable water, Public health, Fertilizers.

Sources of nitrates observed in farm well water appear related to improper location and construction of wells. Statistical analysis of the low levels of applied inorganic N fertilizer suggest that the fertilizer applied was not related to the nitrate con

tent of the water. Although the presence of animal health problems did not correlate with levels of nitrates in well waters and with the use of inorganic fertilizers, the presence of many variables made evaluation difficult. The nitrate levels in many rural and domestic water supplies were sufficiently high to potentially produce physiological impairment in animals drinking those waters. Clinical signs may have been obscured by their own complexity and subtleness. The significance of nitrates in drinking waters can currently be objectively measured only by the development of acute nitrate poisoning.--Copyright 1975, Biological Abstracts, Inc.

SUSPENDED MATTER AND ITS COMPONENTS IN THE BLACK SEA, (IN RUSSIAN),
Institute of Biology of the Southern Seas, Sevastopol (USSR).
D. M. Vityuk.
Gidrobiol Zh 11(1), 12-18, 1975.

Descriptors: Bacteria, Assay, Suspended solids, Plankton, Metals, Sulfides, Sea water.
Identifiers: *Black Sea, USSR.

Assays of suspended matter (40) from the Black Sea near the Danube mouth, at the Bosporus and in the central part of the Sea were examined in Nov. 1971. The data are compared with previously performed analyses from the Sevastopol area and the mouths of 19 rivers flowing into the Black and Azov Seas (USSR). The two main types of Black Sea suspension are of autochthonous and allochthonous origin. The formation of insoluble metal sulfides in deep water, specific for the Black Sea, is 1 of the sources of autochthonous suspended material. The carbonate portion of the mineral part of the Danube suspended material does not usually exceed 7%, in the mineral part of the abyssal region it is above 25%.--Copyright 1975, Biological Abstracts, Inc.

5C. Effects Of Pollution

NITROGEN, PHOSPHORUS AND CARBON FLUX IN CHESAPEAKE BAY MARSHES,
Virginia Inst. of Marine Science, Gloucester Point.
D. M. Axelrad, K. A. Moore, and M. E. Bender.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-251 549, $5.00 in paper copy, $2.25 in microfiche. Virginia Water Resources Research Center, Blacksburg, VWRRC Bulletin 79, January 1976. 182 p. 53 fig, 17 tab, 106 ref, 2 append. OWRT B-027-VA (2).

Descriptors: *Nitrogen, Estuaries, *Phosphorus, *Nitrogen fixation, Marshes, *Carbon, Detritus, *Chesapeake Bay, Algae, *Virginia, *Salt marshes, Wetlands, Nitrates, Nitrites, Dissolved solids, *Nitrogen cycle, *Cycling nutrients, Path of pollutants.
Identifiers: Spartina, Dissolved carbon, Benthic algae, Organic carbon.

Annual nitrogen, phosphorus and carbon budgets for two Virginia salt marshes were determined by monthly measurements of water discharge and constituent concentrations over tidal cycles. Considering all three forms of phosphorus measured (total, dissolved organic and orthophosphate) there was a net loss from the estuary to the marshes. The data reveal a loss of particulate phosphorus of estuarine origin to marsh sediments and mineralization of this phosphorus in the marshes with subsequent export of dissolved inorganic and organic phosphorus back to the estuary. Nitrogen flux data show a loss of nitrate and nitrite to the marshes. Particulate nitrogen is imported to the marshes where it is mineralized and returned to the estuary as ammonia and dissolved organic nitrogen. The magnitude of nitrogen export suggests significant fixation of atmospheric nitrogen by marsh flora with subsequent export as dissolved species. Carbon flux data show significant contributions of both particulate and dissolved organic carbon to the estuary from the marshes. Estimates of export, based on marsh grass productivity, suggest a loss of 36 and 49 percent of a year's primary production on the marshes as detritus for Ware and Carter Creeks respectively.

ENERGY AND POLLUTION CONCERNS IN DREDGING,
Army Engineer Div. South Atlantic, Atlanta, Ga.
A. W. Mohr.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 101, No. WW4, Proceedings Paper 11733, p 405-417, November 1975. 4 fig, 1 tab, 3 ref, 2 append.

Descriptors: *Dredging, *Canals, Channels, Construction equipment, *Energy, Air pollution, Excavation, Earth handling equipment, Sediments, Environmental engineering, Slurries, Land reclamation, Solid wastes, Water pollution.
Identifiers: *Dredges, *Waterways, Excavating equipment.

Dredging equipment in the United States should be augmented for a more versatile dredging fleet by the addition of the mechanical bucket ladder dredge for channel work. The addition of the bucket ladder dredge is especially desired in view of the relatively new concerns of energy conservation and pollution abatement. From these concerns, the former is well defined but the latter is not. In most cases both concerns oppose each other and interfere with the conventional concept of economy. The new concerns are expected to shift the conventional concept of economy toward efficiency in terms of amount of bottom density material dredged, transported, and deposited per unit of fuel. This shift is expected to be accompanied by a change in emphasis from maximum solid flow rate toward maximum effluent density. Bucket ladder dredges are inherently well suited to satisfy the new concerns, especially at long transport distances. (Roberts - ISWS)

THE BIOGEOCHEMISTRY OF PHOSPHORUS IN AN EXPERIMENTAL LAKE ENVIRONMENT: EVIDENCE FOR THE FORMATION OF HUMIC-METAL-PHOSPHATE COMPLEXES,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
T. A. Jackson, and D. W. Schindler.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, p. 211-221, 1975. 11 fig., 1 tab., 14 ref.

Descriptors: *Cycling nutrients, *Chelation, *Phosphorus, *Humus, Chemical reactions, Bottom sediments, Microorganisms, *Canada, Iron, Aluminum, Carbon, Fulvic acids, Humic acids, Lakes.
Identifiers: *Phosphorylation.

Movements, transformations, and interactions with humic matter of P32 labeled orthophosphate were studied in outdoor pools containing lake water, lake water + bottom mud, or lake water + bottom mud + formalin. Microorganisms changed dissolved P32 phosphate into higher molecular weight substances and accelerated transfer of dissolved P32 to mud. Water and mud were fractionated and subjected to gel filtration, then analyzed. Most lake water P32 was water-extractable. Most P32 in mud was non-extractable and the extractable portion was concentrated in the sodium hydroxide extract. Phosphorus was always associated with iron and aluminum, not calcium. P32 was highest in fractions richest in humic matter. In Sephadex fractions of alkali-extracted humic matter from mud, iron, aluminum, and phosphorus were correlated with organic carbon. There was a relationship between P32 bound per micromole iron + aluminum and the molecular structure of humic matter and an inverse relationship between P32 and total phosphorus per micromole iron + aluminum. It is concluded that phosphorus was bound to iron and aluminum complexes of humic matter. Added P32 coordinated only to iron and aluminum atoms not already saturated with phosphorus. More P32 was bound per mole iron + aluminum in fulvic acid than in humic acid fractions. (Buchanan-Davidson--Wisconsin)

tion, Discharge(Water), Inflow, Dominant organisms, Water circulation.
Identifiers: *Riverine lakes, *Southern Indian Lake, Manitoba, *Churchill River(Manitoba), River plumes, Melosira, Nutrient sources.

Southern Indian Lake, Manitoba, was studied to determine mechanisms causing high production in this riverine lake and to assess the river's role in maintaining productivity. Although mean water residence time was 9 months in the entire lake, the Churchill River plume was renewed every two-three months and was the source of a relatively high phosphorus load. Lake mainstem stations had higher average algal biomass and chlorophyll concentrations than regions receiving local drainage; these correlated with estimated phosphorus loadings, but algal biomass and chlorophyll ranges were less than expected from nutrient considerations. Biomass and Secchi disk depths increased from inlet to outlet. Increasing clarity away from the inlet was due to sedimentation. In the mainstem, Melosira dominated during phytoplankton maxima. Nutrients declined rapidly with onset of spring bloom. The two phytoplankton maxima occurred earlier near the inlet than the outlet; this was not due to differential heating but was flow related, suggesting that nutrient recharge from the river after the spring bloom was required to initiate the second maximum. Productivity experiments indicated that in late summer upstream lake regions were in a period of population replacement or decline, while the lower lake had actively growing populations and higher production rates. (Buchanan-Davidson--Wisconsin)

ALGAE FROM MONTANE STREAMS ON THE ISLAND OF MAHE, IN THE SEYCHELLES,
Polish Academy of Sciences, Krakow. Instytut Botaniki.
K. Starmach.
Acta Hydrobiologica, Vol. 17, No. 3, p. 201-209, 1975. 4 fig., 8 ref.

Descriptors: *Systematics, *Algae, *Streams, Islands, Cyanophyta, Chlorophyta, Rhodophyta, Diatoms, Periphyton, Varieties, Africa, *Indian Ocean.
Identifiers: Mahe Island, *Seychelles Islands.

Samples of algae were collected in mountain streams on the Island of Mahe in the Seychelles Island group located in the west Indian Ocean north of Madagascar. Six species of blue-green algae (Homoeothrix juliana, Calothrix muscicola nova sp. ad interim, Scytonema bohneri, Lyngbya kutzingii, L. aerugineo-coerulea, and L. amplivaginata), one species of green algae (Oedogonium sp. Penium polymorphum), and one species of red algae (Batrachospermum capensis spec. nova) were identified. Detailed descriptions are presented for all algae found. The blue-green alga, Calothrix muscicola, is probably a new species, differing in size and in the absence of swelling at the base from C. epiphytica or C. stellaris. Twenty species of diatoms were also identified and the frequency of their distribution recorded; Achnanthes minutissima, Eunotia arcus var. fallax, Eunotia fallax, Frustulia saxonica var leptocephala, and Gomphonema gracile were the most common. (Buchanan-Davidson--Wisconsin)

ALGAE IN THE GEBEL MARRA MTS IN WEST SUDAN,
Polish Academy of Sciences, Krakow. Instytut Botaniki.
K. Starmach.
Acta Hydrobiologica, Vol. 17, No. 3, p. 211-221, 1975. 5 fig, 1 tab., 3 ref.

Descriptors: *Algae, *Chlorophyta, *Cyanophyta, *Diatoms, *Rhodophyta, *Africa, Speciation, Systematics, Nostoc, Cladophora, Variety, Subtropic, Foods, Diets.
Identifiers: *Gebel Marra (Sudan), Lake Dariba, Spirulina platensis, Spirulina massartii, Dermocarpa xenococcoides, Nostochopi lobatus, Biddulphia levis, Fragilaria pinnata, Epithemia turgida, Rhopalodia gibberula var. van heurckii, Rhizoclonium, Spirogyra, Mougeotia, Oedogonium, Tribonema, Audouinella.

Algae collected at five different sites in the volcanic Gebel Marra Mountains of West Sudan in 1964 were identified. A total of 31 different species of blue-green algae, 3 species of green algae, and 34 species of diatoms are described. Taxonomic studies were made of each algal species. The frequency of distribution of the various diatom species is indicated. The blue-green algae were the most common; the most characteristic of these were Spirulina platensis and S. massartii, which produced blooms in Lake Dariba. This species occurs in masses in subtropical countries and that of Lake Chad (Africa) is used as food by the natives, and is considered more digestible than Chlorella. Various species of Nostoc and Dermocarpa xenococcoides and Nostchopsis lobatus, which are found only in tropical regions, were also present. The most characteristic and frequently found species of diatoms were Biddulphia levis, Fragilaria pinnata, Epithemia turgida, and Rhopalodia gibberula var. van heurckii. Smaller numbers of other species were also found. In the green algae, filamentous forms such as Rhizoclonium, Cladophora, Spirogyra, Mougeotia, Oedogonium, and Tribonema were found. The red alga Audouinella was also present; the blue-green alga Dermocarpa xenococcoides was always present on the filaments of this alga. (buchanan-Davidson--Wisconsin).

WATER CHEMISTRY AND FERTILITY OF TWENTY-THREE CONNECTICUT LAKES,
Connecticut Agricultural Experiment Station, New Haven.
W. A. Norvell, and C. R. Frink.

Descriptors: *Water chemistry, *Lakes, *Eutrophication, *Connecticut, Turbidity, Color, Nitrogen, Phosphorus, Specific conductivity, Alkalinity, Calcium, Magnesium, Chlorophyll, Oxygen sag, Potassium, Chlorine, Lake morphology, Bicarbonates, Trophic level.

The water chemistry of twenty-three Connecticut lakes was studied in fall of 1973 and spring and summer of 1974 in order to evaluate the current condition of the lakes with respect to the plant nutrients, nitrogen and phosphorus; to determine which lakes have changed significantly during the last few decades; and to understand factors contributing to the eutrophication of these lake. The lakes range from clear, infertile, oligotrophic water to turbid, highly fertile eutrophic water subject to excessive growth of algae and aquatic weeds. Many became eutrophic during the last few decades. Generally the concentrations of phosphorus and chlorophyll-a have increased and transparency decreased. During the summer, oxygen supplies in deep water are low. Algal populations, measured as chlorophyll-a were closely related to phosphorus concentrations. Phosphorus was in shorter supply than nitrogen in most lakes and is the nutrient most likely to limit algal growth. Eutrophication of these lakes undoubtedly associated with changes in type and intensity of land use in their watersheds. The appendix shows the sampling date and depth, the transparency, alkalinity, chlorophyll-a soluble phosphorus, total phosphorus, ammonia nitrogen, nitrate-nitrogen, soluble nitrogen and total nitrogen for each lake. (Buchanan-Davidson--Wisconsin).
W76-06207

NITROGEN AND SULFUR CONTENT AND PH OF PRECIPITATION IN IOWA,
Iowa State Univ., Ames. Dept. of Agronomy.
M. A. Tabatabai, and J. M. Laflen.
Journal Environmental Quality, Vol. 5, No. 1, p. 108-112, 1976. 2 fig., 4 tab., 34 ref. 1845. IA50010.

Descriptors: *Nitrogen, *Sulfur, *Hydrogen ion concentration, *Precipitation(Atmospheric), *Nutrients, Snow, Rain, Nitrates, Ammonia, Sulfates, Phosphates, Phosphorus, Annual, *Iowa.

To determine pH, ammonia nitrogen, nitrate nitrogen, sulfate sulfur, and phosphate phosphorus concentrations contained in precipitation in Iowa, and to determine what quantities of these nutrients are added annually by precipitation, six terrestrial sites were sampled between September 1971 and December 1973. Annual amounts of ammonia nitrogen and nitrate nitrogen added by precipitation were approximately equal. The annual amount inorganic nitrogen added per hectare ranged from 10 kg in north-central Iowa to 14 kg in west-central Iowa. Annual amount of sulfate sulfur added per hectare ranged from 13 kg in the northeast to 17 kg in the north-central. It was estimated that precipitation added an average of about 0.6 kg ammonia nitrogen, 0.6 kg nitrate nitrogen, and 1.5 kg sulfate sulfur per hectare monthly. Seasonal variations were observed for sulfate sulfur as values were higher in fall and winter than in spring and summer. The average annual pH was 6 in rainfall and snowfall both years; pH values were rarely as low as 4. The phosphorus content of precipitation was very small; at the most only about 0.1 kg of water soluble phosphate phosphorus was added annually per hectare. Nitrate nitrogen was not found in any precipitation sample analyzed. (Buchanan-Davidson--Wisconsin)
W76-06208

THE IMPORTANCE OF DIURNAL VARIATION OF PHOTOSYNTHESIS VS. LIGHT CURVES TO ESTIMATES OF INTEGRAL PRIMARY PRODUCTION,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
E. J. Fee.
Verhandlungen International Vereinigung Limnologie, Vol. 19, p. 39-46, 1975. 3 fig., 1 tab., 21 ref.

Descriptors: *Estimating, *Diurnal, *Photosynthesis, *Light intensity, *Primary productivity, Phytoplankton, Measurement, *Canada, Model studies, Time, Lakes, Annual.
Identifiers: Experimental Lakes Area(Ontario).

A method of estimating integral phytoplankton primary production based on photosynthetic response to light in an incubator, light extinction in the water body, and distribution of surface light over time using a digital computer program was modified incorporate variation of photosynthesis versus light curve during the day. Three lakes in the Experimental Lakes area, Ontario, were the study sites. There was no consistent change of photosynthetic rate over days at low irradiances accounting for interaction between light and time. Results were summarized for computer analysis as follows: production at all irradiances was invariant from sunrise until noon, then declined linearly to minimum production at sunset. This model was incorporated into the computer program and used to compute annual lake basis productivity. A second model was developed assuming no diurnal variation at low irradiances. Another model used exponential rather than linear interpolation to compute production from incubator data. Samples should be taken in the morning to obtain comparable data. In calculating integral daily production, it is not important to incorporate diurnal variation effects, since sampling and data analysis errors are often greater. Simple simulation models can demonstrate the actual significance of seemingly important relationships like diurnal variation. (Buchanan-Davidson--Wisconsin).

ANNUAL DEVELOPMENT OF PLANKTON IN A RIVER WATER INTAKE WEIR AND IN A TREATMENT POND AND ITS REMOVAL IN TREATMENT PLANTS,
nstytut Ksztaltowania Srodowiska, Warsaw (Poland). Zaklad Uzytkowania i Ochrony Wod.
H. Klimowicz.
Acta Hydrobiologica, Vol. 17, No. 3, p. 299-308, 1975. 2 fig., 8 ref.

Descriptors: Resistance, *Plankton, *Water purification, *Water treatment, Water intakes, Varieties, Chlorination, Coagulation, Filtration, Settling basins, *Weirs.
Identifiers: *Uszwica River(Poland).

Seasonal qualitative and quantitative phytoplankton changes in a river intake weir on the Uszwica River, Poland, and a settling pond were investigated to determine their tolerance to several water purification stages. Diatoms numbers increased from intake to the middle of the pond, then decreased. Numbers of algae, protozoa, and rotifers increased throughout the pond length. Phytoplankton (especially diatoms) dominated all year, but zooplankton were rare. Species are classified by rates at which they were removed by water treatment (concrete settling tank with added coagulant, sand filtration, chlorination). Ninety-five taxonomic units were identified; forty-two were found in completely treated water, but specimen numbers were greatly reduced. Curves illustrating development of organisms in the pond and river intake were similar. Seasonal changes in plankton numbers seemed due to changes in mean water temperature. High dissolved oxygen and pH values of 7.1-7.6 were favorable to plankton growth. Fluctuations in water turbidity paralleled the total number of organisms. Turbid water was chiefly polluted with mineral rather than organic compounds. Rapid exchange ofriver water in the pond prevented plankton blooms. Plankton can be used to record changes occurring in treated water and evaluate treatment methods. (Buchanan-Davidson--Wisconsin).
W76-06211

CHANGES IN WATER QUALITY IN FINNISH LAKES AND RIVERS 1962-1973 (IN FINNISH WITH ENGLISH SUMMARY),
National Water Board of Finland, Helsinki. Research Inst.
R. Laaksonen.
Report No. 12, 1975. 66 p. 64 fig., 5 tab., 3 ref., 2 append.

Descriptors: *Water pollution, *Water quality, *Lakes, *Rivers, Specific conductivity, Chlorides, Sulfur, Regression analysis, Running waters, Autumn, Nitrogen, Alkalinity, Electrolytes, Acidity.
Identifiers: *Finland.

Water quality studies of Finnish lakes and rivers from 1962-1973 showed that conductivity, chloride, and total sulfur had increased in running waters. Observations were insufficient to adequately describe the dynamic processes taking place. More changes were observed in the autumn than the spring. Leaching was important. Water quality changes were slightly more frequent in deep water than in running water. More changes were observed at 5 m depths and fewer changes in water near the bottom. Salt concentrations increased in many deep water stations; oxygen levels varied; total nitrogen sometimes increased; and alkalinity sometimes decreased. Water quality changes were more common in the great lake systems than in waters near the coast or in northern Finland waters. Water quality had deteriorated in some areas but seemed to be improving in other areas. Electrolytes were high in river systems in the south and southwest. Salts, sulfur, and chloride increases were less frequent in the great lakes and not observed near the southwest coast. Acidity decreased in rivers on the south and southwest coasts. Fewer changes were observed in waters on the Ostrobothnian coast than in Lake Finland. Detailed tables of lotic and lentic waters show the trend of their components at the 95% confidence level. (Buchanan-Davidson--Wisconsin).

THE PLANKTONIC CRUSTACEANS OF MONCOVE LAKE, MONROE COUNTY, W. VA.,
Arizona State Univ., Tempe. Dept. of Zoology.
W. W. Taylor.
Proceedings West Virginia Academy of Science, Vol. 46, p. 223-229, 1974. 4 tab., 9 ref.

Descriptors: *Reservoirs, *Crustaceans, *West Virginia, Varieties, *Daphnia, *Zooplankton, Oligotrophy, Dominant organisms.
Identifiers: *Moncove Lake(W Va), Bosmina longirostris, Alona, Daphnia catawba, Daphnia ambigua, Mesocyclops edax, Diaptomus pallidus.

Moncove Lake, West Virginia, a small impoundment used for sport fishing, was studied from August 1972-August 1973 to determine planktonic crustacean abundances and species composition. Samples were removed with replicate vertical tows from 0.5 m above the bottom at two sites. The crustacean community consisted of Bosmina longirostris, Alona sp., Daphnia catawba, Daphnia ambigua, Mesocyclops edax, and Diaptomus pallidus. Total crustacean abundance at both stations followed the same seasonal pattern, but changes were usually detected first at the upstream station. The upstream station contained a greater yearly mean crustacean density and more individuals/sq cm in summer; mean crustacean abundance during the growing season was not significantly different. D. ambigue, D. catawba, and M. edax were the dominant zooplankton at both stations, but abundances varied. D. ambigua and M. edax populations were highest at the upstream station; D. catawba was highest at the downstream station. Total crustaceans and individual abundance followed the same general pattern. D. ambigua was the first dominant species to reach maximum densities at both stations; D. catawba reached maximum density next at the lower station, followed by M. edax. The reverse was true at the upper station. Moncove Lake was considered oligotrophic. (Buchanan-Davidson--Wisconsin).
W76-06214

AQUATIC INSECTS OF WISCONSIN,
Wisconsin Univ., Madison. Dept. of Entomology.
W. L. Hilsenhoff.
Wisconsin Department of Natural Resources Technical Bulletin No. 89, 1975. 53 p. 352 fig., 79 ref.

Descriptors: *Wisconsin, *Aquatic insects, *Systematics, Varieties, Ecology, Distribution, Stoneflies, Mayflies, Dragonflies, Caddisflies, Lacewings, Midges, Diptera, Water beetles, Insect control.
Identifiers: Megaloptera, Hemiptera, Neuroptera, Lepidoptera, Coleoptera.

Taxonomic advances have been made since keys to genera of insects in North America were published. Due to increased interest in the aquatic environment, generic keys have been prepared for aquatic insects occurring in Wisconsin. The keys are restricted to genera which are likely to be found in Wisconsin and include only the aquatic stages of these genera. General information on the biology, ecological requirements, distribution, and abundance of genera in Wisconsin is included. Each key has an appended list of species which occur in Wisconsin; species and genera that may occur but have not yet been collected are marked with an asterisk. References to recent keys to species that are not monotypic are included for most orders. Because of uncertainty in identification, no list of species is appended for Diptera, Lepidoptera, and Neuroptera. No effort was made to denote species of Ephemeroptera not collected in Wisconsin. Keys are presented for Plecoptera (stoneflies), Ephemeroptera (mayflies), Odonata (dragonflies), aquatic Hemiptera (bugs), Trichoptera (caddisflies), Megaloptera (fishflies and alderflies), aquatic Neuroptera (spongilia flies), aquatic Lepidoptera (moths), aquatic Coleoptera (beetles), and aquatic Diptera (flies and midges). A glossary of terms used in the keys is included. (Buchanan-Davidson--Wisconsin).

ECOLOGY AND BIOGEOGRAPHY OF MAYFLIES (EPHEMEROPTERA) OF RUNNING WATERS IN THE POLISH PART OF THE CARPATHIANS. I. DISTRIBUTION AND QUANTITATIVE ANALYSIS,
Jagellonian Univ., Krakow (Poland). Dept. of Hydrobiology.
R. Sowa.
Acta Hydrobiologica, Vol. 17, No. 3, p. 223-297, 1975. 8 fig., 18 tab., 120 ref.

Descriptors: *Ecological distribution, *Biogeography, *Mayflies, *Rivers, *Distribution patterns, Physicochemical properties, Streams, Water levels, Velocity, Temperature, Turbidity, Hydrogen ion concentration, Hardness(Water), Oxygen, Varieties, Dominant organisms, Habitats, Seasonal, Speciation, Europe.
Identifiers: *Poland, *Carpathian Mountains(Poland), Nymphs.

Mayfly abundance and distribution were studied in running waters in the Polish portion of the Carpathian Mountains and in the territory bounded by the Vistula and San Rivers. Previous studies are also reviewed. Sixty-eight streams ranging from high mountain streams to lowland rivers were studied between 1958-1972. Each region and sampling station is carefully described and physicochemical environmental factors indicated, i.e., variations in water level and flows, current velocity, temperature, turbidity, pH, hardness, oxygen. Over 3346 winged mayflies and 100,000 nymphs belonging to 97 species were collected. Each species and the stations where they were found are listed. Comments are made where the nomenclature had changed or the identification seemed incorrect. This comprehensive investigation delineates the maximum range for each species, its distribution within the investigated area, and along specific water courses. Six different longitudinal zones were distinguished in the Sola, Skawica, Raba, and San catchments and the Dunajec and its tributaries from the Tatras and Groce, which were inhabited by five different mayfly nymph communities. They are identified as to species composition and dominance. The quantitative distribution of mayflies is indicated at five habitats in the River Raba catchment area at various seasons. THE RELATIONSHIPS OF PHOSPHORUS AND NITROGEN TO THE TROPHIC STATE OF NORTHEAST AND NORTH-CENTRAL LAKES AND RESERVOIRS.
Pacific Northwest Environmental Research Lab., Corvallis, Oreg.
Available from the National Technical Information Service, Springfield , Va 22161 as PB-240 937, $4.00 in paper copy, $2.25 in microfiche. Working Paper No. 23, December 1974. 40 p. 7 fig., 14 ref., 2 append. 1BA029

Descriptors: *Eutrophication, *Trophic level, *Phosphorus, *Nitrogen, Lakes, Northeast U.S., Chlorophyll, Nuisance algae, Secchi disks, Algae, Depth, Limiting factors, Nutrients, Connecticut, Maine, Massachusetts, Michigan, Minnesota, New Hampshire, New York, Rhode Island, Vermont, Wisconsin.
Identifiers: *Phosphorus input guidelines, *North-central U.S., National Eutrophication Survey.

National Eutrophication Survey data collected during 1972-1973 from lakes and reservoirs in ten

northeast and north-central states were used to describe relationships between total phosphorus concentrations and chlorophyll in phosphorus-limited lakes, which were used to establish phosphorus guidelines (20-30 micrograms total phosphorus/l) to avoid nuisance phytoplankton blooms. Oligotrophic and mesotrophic lakes had chlorophyll concentrations less than 12 micrograms/l. Secchi disc readings (in eutrophic lakes) were less than 2 m, above 6.6 feet in mesotrophic lakes, and above 11.8 feet in oligotrophic lakes. Relationshipes between median fall total phosphorus concentrations and algal yields suggested a total phosphorus guideline of 25 micrograms/l to maintain algae-free conditions. Using Vollenweider's concept, total phosphorus loading guidelines were established for phosphorus-limited lakes and reservoirs. Loading limits were established for each lake based on mean depth and hydraulic retention time. A relationship deriving total nitrogen-loading guidelines for nitrogen-limited lakes was developed. All nitrogen-limited lakes studied were eutrophic, indicating that usually nitrogen-limitation does not occur until a lake is highly enriched. These guidelines plus knowledge of nutrient levels, land use, lake use, and lake morphometry can be used to establish enforceable nutrient criteria and to avoid nuisance algal bloom conditions. (Buchanan-Davidson--Wisconsin).

Descriptors: *Eutrophication, *Surveys, *Sampling, *Analytical techniques, Chemical properties, On-site tests, Precipitation(Atmospheric), Streams, Sewage effluents, Septic tanks, Northeast U.S., Stream flow, Runoff, Drainage area, Lakes, Bioassay, Nutrients, Algae, Minnesota, Michigan, Wisconsin, New York, Connecticut, Massachusetts, Rhode Island, Delaware, New Hampshire, Maine.
Identifiers: *Nutrient sources, *National Eutrophication Survey, Selenastrum capricornutum, Nutrient loads.

The chemical, physical, and biological methods and other procedures used by the National Eutrophication Survey for studying lakes, streams, and municipal sewage treatment plant effluents in ten northeastern states are described. Estimates of streamflows and runoff for streams and drainage areas for each stream, lake or reservoir were made. Lake tributary and outlet nutrient loads were estimated for an average flow year. Using regression analysis, the results showed annual loading values generally within a few percent of the loading which would be estimated if it were assumed that nutrient concentrations did not vary with changes in stream flow. Usually 100% of point-source loads eventually reached the lake or reservoir. Nutrient contributions of unsampled portions of drainage areas were estimated by using the average nutrient export per unit area of sampled stream drainage and multiplying that by the area of the unsampled portion. When sewage plant effluents were not sampled, nutrient loads were estimated on the basis of 100 gallons/capita/day. Total phosphorus and nitrogen contributions were also estimated on a per capita/year basis. Algal assay tests were conducted with Selenastrum. Phytoplankton was identified and counted, and the most prevalent genera and total counts per ml were tabulated for each lake sampled. (Buchanan-Davidson--Wisconsin).

PHYTOPLANKTON BIOMASS AND DISTRIBUTION IN A SHALLOW EUTROPHIC LAKE (LAKE GEORGE, UGANDA),
Vienna Univ. (Austria). Limnologische Lehrkanzel.
G. G. Ganf.
Oecologia (Berl). 16(1): 9-29. Illus. 1974.

Descriptors: *Phytoplankton, *Biomass, Lakes, *Eutrophication, Flow, Fluid movement, Africa.
Identifiers: Anabaena, Lake George, Melosira, Uganda, Water movement.

Lake George, a shallow lake in western Uganda, supports a permanent and dense crop of phytoplankton, and may be regarded as eutrophic although the ambient concentrations of inorganic N and P are low. The figures for the annual nutrient loadings (Viner andSmith, 1973) would suggest, however, a eutrophic lake when analyzed on the scheme of eutrophication proposed by Vollenweider (1968). The horizontal distribution of chlorophyll a shows a concentric pattern, with the maximum values occurring towards the center. This horizontal variation is thought to reflect water movements, and a general pattern of water flow is proposed. The majority of the species show no seasonal variation but populations of both Anabaena and Melosira show annual variations. These 2 spp. also have a horizontal distribution pattern which is the reverse of other species. This pattern is used to support that proposed movements of water. Phytoplankton generation times are discussed in relation to the diurnal cycle occurring in Lake George. --Copyright 1974, Biological Abstracts, Inc.

IMPACT OF THE SEWAGE WORKERS' STRIKE ON THE RIVER CLYDE,
Clyde River Purification Board, Glasgow(Scotland).
D. Hammerton.
Effluent and Water Treatment Journal, Vol. 15, No. 6, p 278-287, June 1975. 4 fig, 1 tab, 1 ref.

Descriptors: *Water quality, *Sewage treatment, *Sewage effluents, *Aeration, Pollution, Waste dilution, Flow augmentation, Oxygen demand, Aquatic populations, Water pollution effects.
Identifiers: *River Clyde(Scotland).

From October 7 to December 2, 1974, 120 workers at three Scottish sewage treatment plants went on strike and during that time about 450 megaliters per day of untreated liquid residuals were discharged into the River Clyde. The main concern was public health, that is, to see that sewers did not become overloaded and that crude sewage did not flow onto the streets. A major effort to monitor damage to water quality was made. In addition to obvious contamination at each sewage outfall there was a marked rise in suspended solids, ammonia and BOD values, with a resultant decrease in dissolved oxygen. In the middle of October oxygen declined rapidly but two days of heavy rainfall increased oxygen concentrations to very safe levels and averted a salmon kill. Two methods of aerating river water were tried on a small scale. Two oxygen injection units were capable of injecting from 1/2 to 1 and 1/2 tons of oxygen per day and were effective, but two floating aerator units did little, probably because the units did not mix water sufficiently. Impact on plants and animals was less than might be expected which emphasizes the fact that conditions on the bottom rather than those in the water determine the ability of life forms to survive. The river recovered in about six months. There was no real threat to public health during the strike because of relatively high water flows (but not high enough to flood streets fortunately), lowered water temperatures, and the fact that treatment plants and rivers were not affected where river water is used for recreation and water supply. Aquatic eco-systems can recover from severe or catastrophic short-term pollution much more rapidly than from lower levels of chronic pollution. (Smith - North Carolina)

HEALTH SIGNIFICANCE OF AIRBORNE MICROORGANISMS FROM WASTEWATER TREATMENT PROCESSES, PART I: SUMMARY OF INVESTIGATIONS,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
J. L. S. Hickey, and P. C. Reist.
Journal Water Pollution Control Federation, Vol. 47, No. 12, p 2741-2757, December, 1975. 54 ref.

Descriptors: *Public health, *Aerosols, *Treatment facilities, Bacteria, Pathogenic bacteria, Coliforms, Air pollution effects, Path of pollutants, Reviews, Microorganisms.
Identifiers: Air pollution sources, Aerated waste water treatment.

This report summarizes 16 published reports representing 13 separate field studies, all that could be found in English, of airborne microorganisms from waste water treatment processes. The earlier studies, from 1907 to the 1950's, established that bacteria was spread by aerosolization from waste water flowing in sewers, sludge aeration tanks, and trickling filters. In 1966, it was shown that trickling filters yielded twice as many coliforms as other plant units, and that half the particles were less than 5 microns in diameter. In a different test, it was calculated that this particle size could penetrate the lungs and that the number of small particles increased with some distance from the waste water sources. Later it was decided that the small aerosols could penetrate both the bronchia and the upper respiratory tract. Aerosol dispersion patterns, taking into consideration the direction of wind, were made. In 1973, a test was undertaken in which bacteria were recovered from various airs around a plant and guinea pigs were inoculated with the organisms. Within 6 weeks the guinea pigs developed lesions. Another study concluded that solar radiation, low relative humidity, and low wind speed reduced aerosol emissions. One report suggested that coliforms may not be a reliable index of air pollution arising from waste water aeration and that total colony count may be a more accurate measure. Some of the reports made conclusions about possible health hazards, but the totality of the significances on health are summarized in the second part of the article. HEALTH SIGNIFICANCE OF AIRBORNE MICROORGANISMS FROM WASTE WATER TREATMENT PROCESSES, PART II: HEALTH SIGNIFICANCE AND ALTERNATIVES FOR ACTION,
North Carolina Univ., Chapel Hill. Dept. of Environmental Science and Engineering.
J. L. S. Hickey, and P. C. Reist.
Journal Water Pollution Control Federation, Vol. 47, No. 12, p 2758-2773, December, 1975. 4 tab, 77 ref.

Descriptors: *Public health, *Treatment facilities, *Aerosols, Bacteria, Pathogenic bacteria, Path of pollutants, *Air pollution effects, Microorganisms.
Identifiers: Aerated waste water treatment, Air pollution sources.

The emission and spread of viable bacterial aerosols from aerated waste water processes has been demonstrated in numerous studies. These aerosols contain a variety of virulent, pathogenic, bacterial genera and species in particles within the human respirable size range for both upper and lower respiratory tract deposition. Present evidence does not, however, confirm or negate the existence of a health risk. Further investigation of health effects is necessary, and concurrent development and evaluation of viable aerosol control measures could be helpful. Environmental monitoring is not of much value without further studies on the health aspects of aerosols. Nonetheless, waste water plant operators and health professionals should be informed of the potential risks from waste water aerosols. These conclusions were drawn from an overall assessment of the results and conclusions of studies into the airborne microorganisms. The studies included field and laboratory investigations, reviews, and surveys from 1907 to 1975. (See also W76-06326) (Loustau-FIRL)

NUTRITIONAL AND PHYSIOLOGICAL EFFECTS OF NITRATES, NITRITES, AND NITROSAMINES,
Florida Univ., Gainesville. Dept. of Animal Science.
R. L. Shirley.
BioScience, Vol. 25, No. 12, p 789-794, December, 1975. 81 ref.

Descriptors: *Septic tanks, *Waste water treatment, *Fertilizer, *Sewage treatment, *Lakes, Nitrates, Nitrites, Eutrophication, Toxicity, Potable water, Animal diseases.
Identifiers: Nitrosamines, Carcinogens.

Areas of high concentrations of livestock, heavy fertilizer application, septic tanks, and dewage plant outflow may produce excessive quantities of nitrates in animals' drinking water and eutrophication of lakes. Nitrates and nitrites consumed in diets of animals are being studied as toxic factors for the animals. Ruminants have greater tolerance of nitrate and nitrite than human infants, but a potential danger still exists. Nitrates have been demonstrated to lessen formation of toxins when added to meat products that contain various toxin-producing microbes. On the other hand, in the presence of various amines in meat and other foodstuffs, nitrites have been demonstrated to produce carcinogenic nitrosamines. Bacteria in the alimentary tract produce nitrosamines from nitrite and amines derived from lecithin and proline. Because experimental doses exceed the concentrations that normally appear, it is not known whether the potential sources of nitrosamines have actually produced cancer in animals. Tests on rats showed that nitrosamines produced cancer in the digestive, urinary, and respiratory tracts, as well as in the liver and reproductive tissues. (Loustau-FIRL)

EFFECTS OF SALINITY ON NITRIFICATION IN THE EAST RIVER,
New York State Dept. of Health, Albany. Div. of Labs. and Research; New York State Dept. of Health Albany. Environmental Health Center.
M. Chen, E. Canelli, and G. W. Fuhs.
Journal Water Pollution Control Federation, Vol. 47, No. 110, p 2474-2481, October, 1975. 3 fig, 3 tab, 25 ref.

Descriptors: *Ammonia, *Nitrites, *Waste water treatment, *Nitrification, *New York, Sampling, Bacteria, Rivers, *Salinity, Environmental effects, Chemical analysis, Waste assimilative capacity.
Identifiers: East River(NY).

Due to known high concentrations of ammonia and nitrite from discharges of waste water treatment plants into New York Harbor, a study was done to determine the rate of nitrification in the East River and to determine the NaCl tolerance of the nitrifying bacteria. Water samples were collected from 12 sites along the East River each week for about three months. Media were prepared with the river dilutions to represent the concentrations of calcium, magnesium, phosphorus, and iron in the undiluted East River water. The samples were incubated for 20 days and then portions were used as inocula. Colonies were selected and streaked twice for isolation. The results of chemical analysis showed that the rates of nitrification in samples from the East River are increased when the sampls are diluted with suitable media prepared with distilled water. The rates of nitrification in samples from the southern or central parts of the East River are higher than those in samples near the sound. Both NaCl and some unknown substances in the filtrate portion of the water seem to inhibit nitrification in the East River. Nitrifying bacteria isolated from the East River were not halophilic. Most nitrifying bacteria in the East River are therefore apparently of terrestrial origin. (Loustau-FIRL)
W76-06335

RELATIONSHIP BETWEEN VARIOUS BACTERIAL POPULATIONS AND COPROSTANOL AND CHOLESTEROL,
Canada Centre for Inland Waters, Burlington (Ontario).
B. J. Dutka, and A. El-Shaarawi.
Canadian Journal of Microbiology, Vol. 21, No. 9, p 1386-1398, September, 1975. 3 fig, 9 tab, 19 ref.

Descriptors: *Viruses, *Model studies, *Coliforms, *Bacteria, *Public health, Treatment facilities, Flocculation, Sampling, Statistical analysis.
Identifiers: *Coprostanol, *Cholesterol.

Since fecal matter in water can carry hazardous viruses, finding traces of coprostanol and cholesterol in raw waters, indicating the presence of fecal matter in water, could be important to public health. A one-year study evaluated the relationship between coliforms, fecal coliforms, fecal streptococci, heterotrophs, and coprostanol and cholesterol. Sewage samples were collected from

four treatment plants, one that chlorinated clarifier effluent, one that chlorinated water before flocculation and added lime to the clarifier tank, one that chlorinated final effluent, and one that chlorinated raw sewage. Water samples were analyzed bacteriologically, and fecal sterol samples were analyzed chemically. Reduction in fecal-sterol levels ranged from 46.93% to 99.81%. A significant relationship existed between coprostanol and cholesterol in all three phases of the sewage-treatment processes. No significant relationships were found to exist between fecal sterols and bacterial parameters in the raw-sewage streams. However, in treated unchlorinated sewage a significant relationship was observed between most bacterial parameters and fecal sterols. A statistical model using the collected data indicated that coprostanol and cholesterol have a high positive correlation, thus supporting the concept that either sterol could be used as an indicator of fecal pollution. (Loustau-FIRL)

USE OF SEWAGE SLUDGE ON AGRICULTURAL LAND AND THE EFFECTS OF METALS ON CROPS,
Agricultural Development and Advisory Service, Wolverhampton (England).
J. H. Williams.
Water Pollution Control, Vol. 74, No. 6, p 635-644, 1975. 10 tab, 7 ref.

Descriptors: *Sewage sludge, *Nitrogen, *Phosphate, *Fertilizer, Toxicity, Heavy metals, Soils, Zinc, Nickel, Copper, Lead, Mercury, Cadmium, Environmental effects, Industrial wastes.
Identifiers: Land application.

Sewage sludges, and particularly liquid digested sludges, are valuable sources of available nitrogen and phosphate, if they are applied in spring when the growing crop can utilize them. Sewage sludge containing industrial wastes must be applied carefully, and sludges that may be toxic are unsuitable for agricultural use. Once a harmful concentration of these toxic metals is built up in soils, the effect can be permanent. Zinc and nickel are absorbed by plant roots and translocated within the plant. Copper becomes concentrated in the roots. Very little of the total lead in the soil is absorbed by plants and it remains in the roots; although it does not seem to affect plant growth, it could harm animals or humans if abnormal amounts are accumulated. Although not enough is known about the behavior of mercury and cadmium, cadmium probably is a risk because it is readily taken up by the roots, and mercury probably is not because its percentage in sludge is so small. (Loustau-FIRL)

NUTRIENT TRANSFORMATIONS IN MASS CULTURES OF MARINE ALGAE,
Woods Hole Oceanographic Institution, Mass. Dept. of Biology.
J. C. Goldman, and J. H. Ryther.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. EE3, Proceedings paper No. 11358, p 351-364, June 1965. 8 fig, 2 tab, 22 ref.

Descriptors: *Algae, *Marine algae, *Environmental engineering, *Nutrients, Ammonia, Geographical regions, Nitrogen, Phosphorus, Sea water, Waste water(Pollution).
Identifiers: *Algal nutrients.

Two mass cultures of marine algai were maintained for 24 continuous weeks on mixtures of secondarily treated wastewater and seawater. Nitrogen removal and algal growth were related to both nitrogen loading in the form of variations in the waste-seawater mixture and changes in the dilution rate. Nitrogen assimilation was limited to about 4 mg/1. High nitrogen removals were associated with a combination of algal assimilation and ammonia evolution at the high pond pH values attained. Algal concentrations represented as both particulate carbon (PC) and particulate nitrogen (PN) decreased linearly with increases in the dilution rate. Maximum algal yields of 6 g PC m-2 day-1 occurred at a dilution rate of 0.75 day-1. (Bell-Cornell)

ACROLEIN RESIDUES IN IRRIGATION WATER AND EFFECTS ON RAINBOW TROUT,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
T. R. Bartley, and A. R. Hattrup.
Report REC-ERC-75-8, May 1975. 13 p, 3 fig, 5 tab, 11 ref.

Descriptors: *Herbicides, Aquatic, Weed control, Irrigation systems, *Rainbow trout, Mortality, Analysis, Water samples, Treatment, Washington, Pesticide residues, Columbia River, Irrigation water.
Identifiers: Columbia Basin Project(WA), *Acrolein.

Studies were conducted on the Columbia Basin Project, Washington, to determine the concentrations of acrolein in irrigation water at several sampling stations during 20 applications of the herbicide for aquatic weed control and at the Bureau of Reclamation's Carter Lake, Colorado Aquatic Weed Test Station to find the effects of simulated acrolein treatment on rainbow trout. Analysis of samples of treated irrigation water shows that the actual acrolein concentrations near application sites agree with the computed levels and that the concentrations decline gradually as the treated water moves downstream. Applications of about 0.1 p/m for 48 hours with one booster application require a distance of 30 to 40 miles (48.3 to 64.4 km) to reduce concentration to the 0.02 p/m level. Acrolein concentrations used for aquatic weed control are toxic to rainbow trout. Acrolein concentrations of 0.2 and 0.02 p/m for exposure periods of 4.8 and 48 hours respectively, are levels considered to be reasonably safe to trout. (Burea of Reclamation)

THE GREEN BAY WATERSHED - PAST/PRESENT/FUTURE,
Wisconsin Univ., Madison Inst. for Environmental Studies.
G. Bertrand, J. Lang, and J. Ross.
Report WIS-SG-76-229; January 1976, 319 p.

Descriptors: *Environment, *Ecology, *Ecosystems, *Lake Michigan, Aquatic environment, Biological communities, Water pollution, Water quality, *Wisconsin, Michigan, Bays, Natural resources, Water pollution effects.
Identifiers: *Green Bay watershed(Wisc), Green Bay ecosystem(Wisc), Resources use, Pollution control.

Green Bay is a major geographic feature of Wisconsin and Michigan. It is a significant natural resource. It is a recreation area, a fishery, a commercial waterway, and it contains a highly productive biological system. Since the time of settlement, 150 years ago, the Green Bay system has been changed drastically. The changes are largely the result of two major activities: (1) heavy use of resources in the region; and (2) use of the surface water as a pollution sink, causing a progression of poor quality water up the bay from south to north as time goes on. The interaction of resource use and pollution has caused a depletion of natural resources, including some that would have the capacity to renew themselves under less stress. But it has also vastly changed the population dynamics of an array of living species in the bay. It is possible that a critical point of change is being reached in the condition of Green Bay. (NOAA)

EFFECT OF SALINIZATION ON CERTAIN SOIL MICROFLORA,
Institute for Applied Research on Natural Resources, Baghdad(Iraq).
A. N. Yousef, S. M. Damirji, I. J. Al-Khalili, and A. M. Al-Zubar.
Technical Bulletin 83, August, 1975. 27 p, 6 fig, 9 tab, 18 ref.

Descriptors: *Saline soils, *Clostridium, *Nitrogen fixing bacteria, *Sulfur bacteria, *Azotobacter, Salinity, Salts, Sulfates, Saline water, Soil microorganisms, Soil bacteria, Nitrification, Soil analysis, Salt tolerance, Fertility.
Identifiers: *Al-Dalmag province(Iraq).

The effect of soil salinity was studied on total microbial count, non-symbiotic nitrogen-fixing Azotobacter and clostridia, nitrifiers, and sulfate reducing bacteria. Three treatments were prepared: non-saline soil supplied with distilled water, non-saline soil supplied with saline groundwater, and saline soil supplied with distilled water. Soil samples were analyzed at 45-day intervals for one year from 0-30 and 30-60 cm depths. In the non-saline and saline soils supplied with distilled water, most of the salts accumulated within the first sampling intervals in the 0-30 cm layer. Salts accumulated gradually in both layers for the non-saline soil supplied with saline groundwater. The effect of salts on soil microflora depends on the quantity and quality of the salts. Azotobacter and the nitrifiers were more affected by salinization than the clostridia. The number of sulfate reducers for all treatments was higher in the 30-60 cm layer. The total microbial count and the count of other bacteria groups showed no marked difference in the upper and lower layers. When salt accumulated in the upper layers, the counts were greater in the lower layers. (Robinett-Arizona)

THE MEDICINE BOW ECOLOGY PROJECT: THE POTENTIAL SENSITIVITY OF VARIOUS ECOSYSTEM COMPONENTS TO WINTER PRECIPITATION MANAGEMENT IN THE MEDICINE BOW MOUNTAINS, WYOMING,
Wyoming Univ., Laramie.
D. H. Knight.
February 28, 1975, 397 p. 14-06-D-7198

Descriptors: Baseline studies, *Cloud seeding, Ecology, Ecosystems, *Wyoming, *Weather modification, Forests, Hydrographs, Silver iodide, Snowmelt, Snow management, Toxicity, Deer, Elk, Fish, Aquatic animals, Aquatic algae, Trout, Vegetation.
Identifiers: *Medicine Bow Ecology Project(Wyo).

In addition to baseline data, the Report includes (1) the results of studies on the impact of snow on

herbaceous and shrubby vegetation, elk, deer, trout, lake phytoplankton, and litter decomposition; and (2) the movement of Ag in an alpine ecosystem, the natural concentration of Ag at 20 locations in the Mountains, and the toxicity of Ag to tufted hairgrass, lodgepole pine seedlings, and rainbow trout. Ecological changes resulting from cloud seeding probably will be very slow, assuming that annual snowfall will be increased by only about 15 percent and only above about 2700 m elevation, and that snow cover duration will be prolonged by only a few days, if at all. The general discussion emphasizes the need for accurate information on the amount, distribution, and duration of the additional snow produced by cloud seeding in order to accurately evaluate impact; the fact that cloud seeding will be but one of several human influences on the ecosystems; and that there is the potential for indirect, undesirable impacts on areas downstream from where the seeding occurs. Six recommendations are listed that seem desirable from an ecological perspective, and information gaps are identified. (Bureau of Reclamation)

TAXONOMY OF KLEBSIELLA PNEUMONIAE ISOLATED FROM PULP/PAPER MILL WASTEWATER,
Pacific Northwest Environmental Research Lab., Corvallis, Oreg.
M. D. Knittel.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-244 405, $4.00 in paper copy, $2.25 in microfiche. Report EPA-660/2-75-024, June 1975. 31 p, 6 fig, 7 tab, 22 ref. 1BB037.

Descriptors: *Microbiology, Isolation, *Pulp wastes, Cultures, Classification, *Systematics, Chemical reactions, Pollutant identification.
Identifiers: *Klebsiella pneumoniae, *DNA.

K. pneumoniae isolated from pulp mills was compared to clinical isolates of K. pneumoniae. Cultures were identical in biochemical reaction in various media and conformed to the recognized schemes of classification of K. pneumoniae. Nucleic acid base composition comparison of these isolates showed that all exhibited a G+C% base composition of 56%+ or minus 1.4%, and all cultures examined fell within this range. A study of the heterologous binding capability between DNAs of these cultures revealed that isolates from both the environment and pathogenic reference had a base sequence from 80 to 100% in common. This confirms the earlier results that pulp mill isolates are the same as clinical isolates. (EPA)

BIOSTIMULATION AND NUTRIENT ASSESSMENT.
Utah Water Research Lab., Logan.
Workshop proceedings PRWG168-1, September 10-12, 1975, Water Research Laboratory, Utah State Univ., Logan, November 1975. Edited by E. J. Middlebrooks, D. H. Falkenborg, and T. E. Maloney. 396 p. R-903523 01.

Descriptors: *Algae, *Bioassay, *Analytical techniques, Growth rates, Nutrient requirements, Laboratory tests, Eutrophication, Toxicity, Limiting factors, Cultures, Model studies, Sampling, Biomass, Waste water(Pollution), Dredging, Anabaena, Water analysis, Management, Sediment-water interfaces, Sediments, Ecosystems, Hardness(Water), Phosphorus, Disposal, Lakes.
Identifiers: *Algal Assay Procedure, *Algal growth potential, *Selenastrum capricornutum, Anabaena flos-aquae.

The application of the Algal Assay Procedure: Bottle Test and its modifications are discussed in relation to various ecological and environmental variables. Contributions focus on the application of the test in biostimulation and toxicity testing; field evaluation of the test on surface waters of North Carolina; its application to define the effects of wastewater effluents upon algal growth in multiple use river systems; and the relationship of laboratory algal assays to measurement of indigenous phytoplankton in Long Lake, Washington. The test's applicability to compare algal growth responses of Selenastrum capricornutum and Anabaena flos-aquae in waters collected from Shagawa Lake, Minnesota; seasonal variation of algal biomass production potential and nutrient limitation in Yaquina Bay, Oregon; and algal nutritional bioassays of Lake Wylie, North Carolina, is described. Nutrient assessments as a basis for lake management priorities, as applied to Wisconsin lakes, is reviewed. Other contributions compare semi-continuous and continuous flow bioassays; the effects of media modifications upon S. capricornutum in batch cultures; sediment-water microcosms designed for assessment of nutrient interactions; effects of water hardness, phosphorus concentration and sample pretreatment on the test; and a elutriate method to determine the significance of dredged material disposal in open waters. (See W76-06697 thru W76-06709) (Auen-Wisconsin).

APPLICATION OF THE ALGAL ASSAY PROCEDURE IN BIOSTIMULATION AND TOXICITY TESTING,
Procter and Gamble Co., Cincinnati, Ohio.
A. G. Payne.
In: 'Biostimulation and Nutrient Assessment,' (PRWG168-1), workshop proceedings September 10-12, 1975, Logan, Utah, Water Research Laboratory, Utah State Univ., Logan, November 1975. p. 3-27. 18 fig, 10 ref.

Descriptors: *Eutrophication, *Algae, *Bioassay, *Analytical techniques, Algicides, Trace elements, Lethal limit, Growth rates, Cultures, Measurement, Laboratory tests, Standing crops, Chelation, Sewage effluents, Zinc.
Identifiers: *Algal Assay Procedure, *Algal growth potential, Microcystis aeruginosa.

The Algal Assay Procedure combined with physical and chemical measurements is a dependable method to assess algal growth potential and show differences in nutrient concentrations between seasons. When oligotrophic water samples were filtered, inoculated, and maintained under laboratory conditions, they supported low algal standing crops all year. Natural populations of these waters also remained low all year. Eutrophic waters in winter supported high maximum standing crops of test algae and high natural populations in spring. The Algal Assay Procedure indicated the relative chelating capacity of synthetic compounds, sewage effluent, and natural chelators in aquatic environments. Laboratory-cultured Microcystis aeruginosa's sensitivity to low free metal levels is used in trace metal/chelator studies. Because the zinc level is close to the Microcystis toxicity level in Algal Assay Procedure media, it should be lowered for optimizing Microcystis growth. The method can also be used to determine algal toxicity of test materials. Results expressed in terms of minimum algistatic concentration after five days represent the test material level which does not cause net changes in test algae populations after chronic exposure, causes primary inhibitory effects at the cellular level, but does not cause permanent or irreversible damage to test cultures. (See also W76-06696) (Buchanan-Davidson--Wisconsin).

FIELD EVALUATION OF THE ALGAL ASSAY PROCEDURE ON SURFACE WATERS OF NORTH CAROLINA,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
C. M. Weiss.
In: 'Biostimulation and Nutrient Assessment,' (PRWG168-1), workshop proceedings September 10-12, 1975, Logan, Utah, Water Research Laboratory, Utah State Univ., Logan, November 1975, p 29-76. 1 fig, 34 tab, 11 ref.

Descriptors: *Eutrophication, *Algae, *Bioassay, *Analytical techniques, Growth rates, Measurement, On-site investigations, Trophic level, Laboratory tests, Nitrogen, Chlorophyll, Productivity, Phosphorus, Autoclaves, Filtration, Deficient elements, Biomass, Limiting factors, North Carolina.
Identifiers: *Algal Assay Procedure, *Algal growth potential, Selenastrum capricornutum.

To establish relationships between assays and existing trophic levels of water bodies, algal assays were made of 44 North Carolina water bodies. Cell density decreased with inorganic nitrogen increase; chlorophyll remained relatively constant; productivity reached a peak in middle concentration ranges. In the growing season soluble nitrogen showed an inverse relationship between cell number and nutrients. Phosphorus values varied but were higher in winter. Chlorophyll showed a positive relationship to cell density, productivity, and nitrogen. In the growing season there was a parallel increase in organic nitrogen and soluble phosphorus and increased productivity, cell density, and chlorophyll. Selenastrum capricornutum growth after autoclaving or filtering water samples indicated total and ambient growth potentials, respectively. Growth responses to added phosphorus or nitrogen compared to growth with original nutrient levels indicated nitrogen/phosphorus ranges. Soluble nitrogen/phosphorus determinations following limitation of either or both nutrients indicated that the ratio can define which nutrient is limiting for a particular water body. The standard assay procedure should be modified to limit the determination to biomass grown in reseeded samples after autoclaving and filtration. Whether a sample is limited in growth potential by the relative quantity of phosphorus or nitrogen can be determined from the total soluble nitrogen/phosphorus ratio. (See also W76-06696) (Buchanan-Davidson--Wisconsin).

APPLICATION OF ALGAL ASSAYS TO DEFINE THE EFFECTS OF WASTEWATER EFFLUENTS UPON ALGAL GROWTH IN MULTIPLE USE RIVER SYSTEMS,
Pacific Northwest Environmental Research Laboratory, Corvallis, Oreg. Eutrophication and Lake Restoration Branch.
W. E. Miller, J. C. Greene, and T. Shiroyama.
In: 'Biostimulation and Nutrient Assessment,' (PRWG168-1), workshop proceedings September 10-12, 1975, Logan, Utah, Water Research

Laboratory, Utah State Univ., Logan, November 1975, p. 77-92. 9 fig, 11 ref.

Descriptors: *Eutrophication, *Algae, *Rivers, *Bioassay, *Analytical techniques, *Growth rates, Washington, Laboratory tests, Effluents, Waste water(Pollution), Toxicity, Phosphorus, Trophic level, Trace elements, Nitrogen compounds, Limiting factors, Heavy metals, Zinc.
Identifiers: *Algal growth potential, *Algal Assay Procedure, *Spokane River system(Wash), Selenastrum capricornutum.

To define effects of domestic and industrial waste discharges on algal growth in the Spokane River system, Washington, the design and interpretation of laboratory algal assays is discussed. Algal responses to nitrogen and phosphorus limitations, trace element deficiency, and heavy metal toxicity were determined. The critical nitrogen:phosphorus ratio to support Selenastrum capricornutum was 11.3:1 micrograms. This ratio can assess algal growth limitations in natural waters. Waters with N:P ratios less than 10 are considered nitrogen-limiting while waters with N:P ratios above 10 may be phosphorus-limiting for algal growth. Correlation of algal assays with yields predicted from N:P ratios depend on the reliability of test procedure. Total soluble inorganic nitrogen (nitrite + nitrate + ammonia) and orthophosphate concentrations or availability in samples were calculated by dividing maximum assay yields by the total soluble inorganic nitrogen or orthophosphate yield coefficient. That samples do not attain the predicted assay yield or nutrient limitation status may be due to growth-limiting nutrients other than nitrogen or phosphorus, presence of toxic materials, or unreliable chemical determinations of orthophosphate and total soluble inorganic nitrogen. Addition of EDTA before assay can help determine nutrient enrichment problems in river systems receiving heavy metal wastes. (See also W76-06696) (Buchanan-Davidson--Wisconsin).

THE RELATIONSHIP OF LABORATORY ALGAL ASSAYS TO MEASUREMENTS OF INDIGENOUS PHYTOPLANKTON IN LONG LAKE, WASHINGTON,
Pacific Northwest Environmental Research Lab., Corvallis, Oreg. Eutrophication and Lake Restoration Branch.
J. C. Greene, R. A. Soltero, W. E. Miller, A. F. Gasperino, and T. Shiroyama.
In: 'Biostimulation and Nutrient Assessment,' (PRWG168-1), workshop proceedings September 10-12, 1975, Logan Utah, Water Research Laboratory, Utah State Univ., Logan, November 1975, p. 93-126. 17 fig, 7 tab, 30 ref.

Descriptors: *Eutrophication, *Algae, *On-site tests, *Bioassay, *Analytical techniques, Washington, Water pollution, Reservoirs, Growth rates, Heavy metals, Autoclaves, Filtration, Zinc, Chemical analysis, Lake morphology, Laboratory tests, Phosphorus compounds, Nitrogen compounds, Nutrients, Limiting factors, Mixing, Hydrologic aspects, Biomass, Chlorophyll, Standing crops.
Identifiers: *Algal growth potential, *Algal Assay Procedure, Long Lake(Wash), Selenastrum capricornutum.

To determine if laboratory algal assays of natural waters actually reflect environmental conditions, studies were made of Selenastrum capricornutum growth potential on autoclaved and filtered water from Long Lake, Washington. Increased algal yields in EDTA spiked test waters showed toxic levels of heavy metal(s). Maximum algal yields were more than twice the minimum biomass level indicating highly eutrophic water. Samples were primarily phosphorus-limited, but sometimes the reservoir was limited so closely by both nitrogen and phosphorus that the primary limiting nutrient could not be determined. Samples collected after an underflow destroyed thermal and chemical stratification and induced extensive vertical mixing would not support algal growth in control or EDTA spiked samples; indigenous phytoplankton contained approximately half the normal chlorophyll concentration/unit volume. Correlation was high between indigenous phytoplankton and S. capricornutum dry weight if consideration was given to whether the reservoir was stratified or homothermal. An equation was developed to predict mean indigenous phytoplankton standing crops. If the reservoir is homothermal, the equation is useful to determine approximate indigenous phytoplankton standing crop at time of sampling; if stratified, it indicates the phytoplankton standing crop which was present approximately two weeks earlier. Another equation was developed to predict chlorophyll concentrations. (See also W76-06696) (Buchanan-Davidson--Wisconsin).

COMPARISON OF THE ALGAL GROWTH RESPONSES OF SELENASTRUM CAPRICORNUTUM PRINTZ AND ANABAENA FLOS-AQUAE (LYNGB.) DE BREBISSON IN WATERS COLLECTED FROM SHAGAWA LAKE, MINNESOTA,
Pacific Northwest Environmental Research Laboratory, Corvallis, Oreg. Eutrophication and Lake Restoration Branch.
T. Shiroyama, W. E. Miller, and J. C. Greene.
In: 'Biostimulation and Nutrient Assessment,' (PRWG168-1), workshop proceedings September 10-12, 1975, Logan, Utah, Water Research Laboratory, Utah State Univ., Logan, November 1975, p. 127-148. 10 fig., 4 tab., 22 ref.

Descriptors: *Eutrophication, *Algae, *Bioassay, *Growth rates, *Anabaena, *Laboratory tests, Minnesota, Cultures, Analytical techniques, Phosphorus, Nitrogen, Inhibitors.
Identifiers: *Algal growth potential, *Algal Assay Procedure, Selenastrum capricornutum, Shagawa Lake(Minn.), Anabaena flos-aquae.

The growth response of Anabaena flos-aquae was studied to determine its reliability as a test alga and to compare its growth response to that of Selenastrum capricornutum in water samples from Shagawa Lake, Minnesota. Results showed that A. flos-aquae can be used as a test organism to define growth potential and nutrient status of lake waters. For counting, sonication was more efficient than blending to fragment A. flos-aquae, but it damaged cells so cannot be used to prepare an inoculum. Water containing more than 0.010 mg/l orthophosphate yielded 0.45 mg/l dry weight A. flos-aquae per 0.001 mg/l phosphorus. Filtered and autoclaved-filtered water samples were primarily nitrogen-limited for S. capricornutum support. The A. flos-aquae growth response indicated constituents other than nitrogen and phosphorus limited its growth in filtered samples; addition of phosphorus stimulated growth to the maximum predicted values in autoclaved-filtered samples. Comparative analysis of algal growth responses suggested that more than one test species should be used to determine the growth potential or nutritional status of a test water, if the presence of a biologically produced toxin is suspected. Filtered and autoclaved-filtered samples must be analyzed to determine the presence of a biologically produced growth-inhibitor. (See also W76-06696) (Buchanan-Davidson--Wisconsin).
W76-06701

SEASONAL VARIATION OF ALGAL BIOMASS PRODUCTION POTENTIAL AND NUTRIENT LIMITATION IN YAQUINA BAY, OREGON,
Pacific Northwest Environmental Research Laboratory, Corvallis, Oreg. Eutrophication and Lake Restoration Branch.
D. T. Specht.
In: 'Biostimulation and Nutrient Assessment,' (PRWG168-1), workshop proceedings September 10-12, 1975, Logan, Utah, Water Research Laboratory, Utah State Univ., Logan, November 1975, p. 149-174. 4 fig., 16 tab., 23 ref.

Descriptors: *Bioassay, *Eutrophication, *Estuaries, *Seasonal, Algae, Laboratory tests, Oregon, Biomass, Sea water, Growth rates, Toxicity, Hydrologic aspects, Precipitation(Atmospheric), Phosphorus, Nitrogen, Sewage effluents, Pollutants.
Identifiers: *Algal Assay Procedure, *Algal growth potential, Yaquina Bay(Ore.), Dunaliella tertiolecta, Thalassiosira pseudonana, Selenastrum capricornutum.

Characteristics of Yaquina estuary that change its potential nutrient limitation were studied using Dunaliella tertiolecta, Thalassiosira pseudonana, and Selenastrum capricornutum as test organisms. Although euryhaline in nature, Dunaliella and Thalassiosira did not produce substantial growth in some water samples. Selenastrum studies showed that the waters were not algicidal or algistatic because of a toxic substance, but lacked the salinity necessary for effective growth. Selenastrum could be used for qualitative bioassay of estuarine waters with salinities up to 6% but not above 9%. Dunaliella responded reliably to addition of limiting nutrients at salinities as low as 5%. The potential nutrient limitation and biomass potential in the Yaquina estuary changed with hydrological and precipitation changes associated with seasonal cycles. The estuary showed maximum sensitivity to addition of nutritive wastes in late spring and summer months when light and temperature potentials were highest, permitting maximum use of nutrients by algae. Bioassays showed that addition of either phosphorus or nitrogen or both could stimulate algal growth depending on point of introduction, season, or time of day. Removal of both phosphorus and nitrogen from sewage effluents or other pollutant sources before disposal into estuaries or their tributaries should be seriously considered. (See also W76-06696) (Buchanan-Davidson--Wisconsin).

ALGAL NUTRITIONAL BIOASSAYS OF LAKE WYLIE, NORTH CAROLINA.
Nalco Environmental Sciences, Northbrook, Ill.
R. M. Gerhold.
In: 'Biostimulation and Nutrient Assessment,' (PRWG168-1), workshop proceedings September 10-12, 1975, Logan, Utah, Water Research Laboratory, Utah State Univ., Logan, November 1975, p. 175-220. 10 fig., 20 tab., 26 ref.

Descriptors: *Eutrophication, *Algae, *Bioassay, *Nutrients, North Carolina, Impoundments, Growth rates, Heated water, Phosphorus, Iron, On-site tests, Laboratory tests, Cyanophyta, Hydrogen ion concentration, Hydrologic aspects, Limiting factors, Chemical properties, Alkalinity, Nitrogen, Biomass.
Identifiers: *Algal growth potential, *Lake Wylie(N.C.), Microcystis aeruginosa, Oscillatoria curviceps, Anabaena flos-aquae.

Water samples from Lake Wylie were studied to understand nutrient relationships related to cultural eutrophication, seasonal changes in algal growth potential, limiting nutrients, biological availability of limiting nutrients, water quality characteristics important in controlling aquatic biota, and as a baseline for detecting significant changes. Samples were generally phosphorus-limited. Iron was occasionally critical. Doubling of the mean annual available phosphorus concentration would be necessary before another nutrient could become limiting. The Allen Steam Station did not affect the ability of Lake Wylie to support algal growth as a function of nutrient content. No urbanization effects were observed. Laboratory experiments and field observations supported the hypothesis that these waters were not conducive to excessive Microcystis aeruginosa growth and indicated that water with a low pH had a negative influence on algal growth. Oscillatoria curviceps was the dominant blue-green alga found. Blue-green algae were an insignificant portion of the total periphyton population at locations not under

e influence of the Allen Station hot water scharge. Seasonal influences were important in voring blue-green algae. Water quality factors H, nutrient loadings, organic matter, dissolved ygen, temperature) would have to change drastilly before Oscillatoria or Microcystis could pose threat to Lake Wylie. (See also W76-06696) uchanan-Davidson--Wisconsin).

UTRIENT ASSESSMENTS AS A BASIS FOR AKE MANAGEMENT PRIORITIES,
isconsin Univ., Madison. Water Resources enter.
D. Uttormark, and J. P. Wall.
: 'Biostimulation and Nutrient Assessment,' RWG168-1), workshop proceedings September -12, 1975, Logan, Utah, Water Research aboratory, Utah State Univ., Logan, November 75, p. 221-240. 8 fig., 5 tab., 14 ref. R-801363.

escriptors: *Eutrophication, *Lakes, Management, *Trophic level, Wisconsin, Clasfication, Phosphorus, Runoff, Decision making, issolved oxygen, Fishkill, Water quality, rainage area, Turbidity.
entifiers: Phosphorus loading rate, Lake Condion Index.

method of assessing management choices based a lake classification index and phosphorusading estimates is presented. Assuming that a ophic condition is a continuous function of nosphorus-loading rates and restricting data to a all geographical area, a relationship between ading rate and lake condition can be demonrated. By combining this knowledge with lake mbers, sizes, and proximity to population cenrs, management priorities can be established. A ke condition index based on hypolimnetic disolved oxygen, transparency, fishkills, and use imairment was developed and aplied to Wisconsin kes. Indices were consistent with lake type and omparable to water quality characteristics, so can e used to quantify Wisconsin lake conditions. A lot of estimated phosphorus-loading versus lake ondition index for Wisconsin lakes was used to dicate management categories. The ratio of rainage basin area to lake area was plotted gainst the lake condition index. A plot of relative hosphorus-loading versus lake condition index ppeared to follow the expected trend. Although his approach indicated alternatives and priorities or lake water quality management, questions emain about whether it provides a perspective of ctual field conditions or whether the parameters eed refinement before results can be useful for anagement options. OMPARISON OF SEMI-CONTINUOUS AND ONTINUOUS FLOW BIOASSAYS,
Utah State Univ., Logan. Div. of Environmental ngineering.
H. Reynolds, E. J. Middlebrooks, D. B. orcella, and W. J. Grenney.
n: 'Biostimulation and Nutrient Assessment,' PRWG168-1), workshop proceedings September 0-12, 1975, Logan, Utah, Water Research aboratory, Utah State Univ., Logan, November 975, p. 241-265. 12 fig., 7 tab., 17 ref.

Descriptors: *Bioassay, *Laboratory tests, Cultures, Toxicity, Chlorophyta, Algae, Growth ates, Mathematical models, Temperature, henols, Competition, Inhibition.
Identifiers: *Selenastrum capricornutum.

n semi-continuous flow cultures the organism pecific growth rate, substrate concentration, and ell concentration vary, while in continuous flow ultures there is a steady state where organism pecific growth rate, substrate concentration, and ell concentration are theoretically constant. If the ithdrawal period in semi-continuous flow cultures is small enough, continuous flow cultures will be approximated. Actually continuous flow cultures may be considered as a special case of semi-continuous cultures where number of withdrawals per unit time in infinity. The critical factor is the time between withdrawal of culture content and addition of fresh substrate. An experiment was conducted to develop a mathematical model to predict temperature effects on phenol toxicity to Selenastrum capricornutum and to compare semi-continuous and continuous flow cultures. Both methods showed that phenol was more toxic at 24C than at 20C or 28C, but the level of toxicity indicated by continuous flow competitive inhibition constants was greater than that indicated by the semi-continuous flow constants. Continuous flow data showed that phenol was more toxic as the hydraulic residence time increased. These differences may be due to variation in the organism specific growth rate which is observed in semi-continuous cultures and may mask certain toxic effects. (See also W76-06696) (Buchanan-Davidson--Wisconsin).

THE EFFECTS OF MEDIA MODIFICATIONS UPON SELENASTRUM CAPRICORNUTUM IN BATCH CULTURES,
Utah Water Research Lab., Logan.
R. F. Malone, K. A. Voos, W. J. Grenney, and J. H. Reynolds.
In: 'Biostimulation and Nutrient Assessment,' (PRWG168-1), workshop proceedings September 10-12, 1975, Logan, Utah, Water Research Laboratory, Utah State Univ., Logan, November 1975, p. 267-292. 22 fig., 3 tab., 10 ref.

Descriptors: *Cultures, *Algae, *Growth rates, Chlorophyta, Mathematical models, Nitrogen, Laboratory test, Essential nutrients, Toxicity, Inhibition, Carbon, Bicarbonates, Phosphates, Hydrogen ion concentration.
Identifiers: *Culture media, *Algal groth potential, Selenastrum capricornutum, Algal Assay Procedure.

In order to develop a mathematical model which accurately predicts the growth of Selenastrum capricornutum under nitrogen limited conditions, an algal growth simulation program was developed permitting simulation of algal growth in batch, semi-continuous, and continuous cultures. When a 0.03 M sodium or potassium phosphate buffer system was used with modified PAAP or NAAM media, a significant reduction in algal growth occurred. This inhibition caused an essential nutrient to be removed, and there may also be a toxicity effect due to the high total dissolved solids level. Addition of 1.512 mg/l sodium bicarbonate to the modified PAAP medium was enough to fulfill the carbon supplementation needs of unaerated cultures, but higher levels of sodium bicarbonate caused minor to severe inhibition of growth. In unbuffered cultures utilizing sodium bicarbonate for carbon supplementation, growth seemed to be limited by pH; use of a buffer with this medium could increase growth. Nitrogen limitation was not significant until nitrogen levels in the modified PAAP medium were reduced to below 0.6 of the unmodified concentration. At 0.2 and 0.4 nitrogen levels, cultures were limited by some factor other than nitrogen until the algal density reached a high level. (See also W76-06696) (Buchanan-Davidson--Wisconsin)

SEDIMENT-WATER MICROCOSMS FOR ASSESSMENT OF NUTRIENT INTERACTIONS IN AQUATIC ECOSYSTEMS,
Utah Water Research Lab., Logan.
D. B. Porcella, V. D. Adams, and P. A. Cowan.
In: 'Biostimulation and Nutrient Assessment,' (PRWG168-1), workshop proceedings September 10-12, 1975, Logan, Utah, Water Research Laboratory, Utah State Univ., Logan, November 1975, p. 293-322. 7 fig., 7 tab., 38 ref. OWRT B-081-UTAH (3).

Descriptors: *Limnology, *Laboratory tests, *Design, *Ecosystems, Chemical reactions, Balance of nature, Nitrogen, Carbon dioxide, Oxygen, Methane, Hydrogen sulfide, Photosynthesis, Sediment-water interfaces, Anaerobic conditions, Analytical techniques, Gases, Nitrogen fixation, Nitrification, Denitrification, Hydrogen ion concentration, Dynamics, Iron, Phosphorus.

Microcosms designed to observe sediment-water interactions of chemical balances of important elements and to perform bioassays in microbially-dominated sediment-water systems are described. Nitrogen, carbon dioxide, oxygen, methane, ethylene, and hydrogen sulfide were detected. In the dark oxygen was used rapidly, thus oxygen was low in the water and atmosphere while the sediment was anaerobic. Atmospheric nitrogen dynamicc were not appreciably affected by nitrogen fixation. Oxygen dynamics were responsive to benthic oxygen demands in dark microcosms; in the light photosynthesis released oxygen into the atmosphere. Carbon dioxide dynamics caused a pH of 6.5-7.0 in the dark and 9.5-10.0 in the light. Methane was produced in all microcosm sediments after 40 days and ethylene after 120 days. Dissolved oxygen dynamics in lighted microcosms showed that almost all carbon dioxide was used. Sediment nitrogen output was small but input was appreciable, especially in upper layers. Nitrogen fixation only occurred in lighted microcosms indicating fixation by blue-green algae. In lighted microcosms nitrogen fixation was enough to fill nitrogen requirements but another nutrient was limiting growth. Denitrification occurred in the plus nitrogen dark microcosms; nitrification was not observed. Organic iron and iron-phosphorus interactions controlled iron and phosphorus availability; these elements were supplied by sediments in excess of photosynthetic needs. EFFECTS OF WATER HARDNESS, PHOSPHORUS CONCENTRATION AND SAMPLE PRETREATMENT ON THE ALGAL ASSAY PROCEDURE--BOTTLE TEST,
FMC Corp., Princeton, N.J. Environmental Research Labs.
J. F. Jadlocki.
In: 'Biostimulation and Nutrient Assessment,' (PRWG168-1), workshop proceedings September 10-12, 1975, Logan, Utah, Water Research Laboratory, Utah State Univ., Logan, November 1975, p. 323-333. 7 tab., 4 ref.

Descriptors: *Bioassay, *Cultures, *Hardness(Water), *Phosphorus, Growth rates, Chlorophyta, New York, Indiana, Calcium carbonate, Sampling, Water treatment, Fluorescence, Chemical analysis, Standing crops, Precipitation(Chemical), Chlorophyll, Eutrophication.
Identifiers: *Algal assay procedure, *Selenastrum capricornutum.

To determine if different types of pretreatment affect the results of the algal assay procedure-bottle test, chemical and algal assays were made on samples from lakes in New York and Indiana. Algal assays using Selenastrum capricornutum were done on water samples before treatment or after pretreatment by autoclaving and/or filtration. The results indicated that pretreatment of the water samples may cause erroneous results in the algal assay procedure-bottle test. The controlling factors include water hardness, phosphorus concentration, and standing algal crops. Waters which are very hard (above 200 ppm as calcium carbonate) and have a high orthophosphate concentration (above 10 micrograms/l) may form a precipitate during autoclaving which effectively depletes the available phosphorus, especially if the precipitate is removed by filtration. A substantial growth of algae (over 200 fluorescence units from in vivo chlorophyll-a) in these waters would release enough dissolved phosphors during autoclaving to

cause a net increase in soluble phosphorus concentration. Much of the increased analyzable orthophosphate was apparently not available for Selenastrum growth, since the expected growth corresponding to the increased orthophosphate analyses was not observed. Filtration pretreatment may also remove large amounts of total phosphorus from eutrophic water samples. (See also W76-06696) (Buchanan-Davidson--Wisconsin)
W76-06708

A BIOASSAY DILUTION TECHNIQUE TO ASSESS THE SIGNIFICANCE OF DREDGED MATERIAL DISPOSAL,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. H. Plumb.
In: 'Biostimulation and Nutrient Assessment,' (PRWG168-1), workshop proceedings September 10-12, 1975, Logan, Utah, Water Research Laboratory, Utah State Univ., Logan, November 1975, p. 335-346. 2 fig., 3 tab., 10 ref.

Descriptors: *Analytical techniques, *Bioassay, *Dredging, *Sediments, Nitrogen, Phosphorus, Algae, Growth rates, Nutrients, Cultures, Diffusion, Alabama.
Identifiers: *Algal growth potential, Dunaliella tertiolecta, Selenastrum capricornutum, Mobile Harbor(Ala), Algal assay procedure, Elutriate test.

A potential problem at open-water dredged material disposal sites is that nutrients (nitrogen and phosphorus) associated with dredged sediment and interstitial water may stimulate algal growth. Conventional bioassays are not applicable, since they only provide information on nutrient bioavailability in dredged material, not the significance of discharge, as conventional bioassays are run for long periods compared to the duration of dredged material perturbation. A bioassay is proposed, based on nonlinear diffusion data observed in the field, approximating changing concentration-time relationships at disposal sites. Elutriates were prepared by shaking sediment with site water, then allowing it to settle. After centrifugation and filtration, samples were inoculated with Dunaliella tertiolecta or Selenastrum capricornutum. At times selected by analysis of dye diffusion data, cultures were diluted to approximate what may happen at the disposal sites. Results with Dunaliella suggested that open-water disposal of Mobile Harbor (Alabama) sediments would have no significant effect on algal population; concentrated elutriates were toxic to Dunaliella. It is concluded that inhibitory and stimulatory additions would not significantly affect algae when dilution rates at open-water sites are considered. The method could provide information to help determine the appropriate method of dredged material disposal. (See also W76-06696) (Buchanan-Davidson--Wisconsin)

APPLICATIONS OF AEROSPACE TECHNOLOGY IN THE PUBLIC INTEREST: POLLUTION MEASUREMENT,
Denver Research Inst., Colo.
C. F. Heins, and F. D. Johnson.
Available from the National Technical Information Service, Springfield, Va 22161, as N74-19234, $4.50 in paper copy, $2.25 in microfiche. Report February 1974. 64 p. 7 fig., 4 tab., 34 ref. NASW-2362.

Descriptors: *Research and development, *Technology, *Remote sensing, Measurement, Pollution abatement, Monitoring, Water pollution, Weather forecasting, Equipment, Satellites(Artificial), Instrumentation, Data collections.
Identifiers: *National Aeronautics and Space Admin.

The contributions of the National Aeronautics and Space Administration to the techniques of pollution analysis and measurement are detailed. Three examples of air pollution monitors include the spectroscopic Dual Isotope Fluorescence Carbon Monoxide Monitor, the Dispersive Infrared Vehicle Exhaust Analyzer, and the Microwave Formaldehyde Analyzer. NASA's satellite sensing program utilizes the Vertical Temperature Profile Radiometer which can obtain temperature data under partly cloudy conditions, ERTS-1 monitors pollutants in coastal waters and lakes, and air pollutants by interferometry. It is conducting research aimed at achieving pollutant measurement, on a global basis, of long-lived gases, such as carbon monoxide, and their sources and sinks. Their satellite Nimbus G (Nibus 6) will have the primary objective of detecting, identifying, mapping, and measuring air and ocean pollution to establish baseline levels. NASA-generated technology transfers for pollution measurement and control include methods to estimate carbon monoxide exposure, a correlation spectrometer for air pollution remote sensing, heat pipe applications for heat transfer, analytic techniques for organic water pollutants; telemetry systems for remote monitoring; environmental models and analysis, weather satellite data for air pollution control, computer programs to analyze combustion, a fuel vaporization model, a coal desulfurization process, and has increased the quality of antipollution equipment in offshore petroleum operations. (Auen-Wisconsin)

DIFFERENCES IN CHEMICAL COMPOSITION BETWEEN TWO SPECIES OF DAPHNIA AND SOME FRESHWATER ALGAE CULTURED IN THE LABORATORY,
Pittsburgh Univ., Pa. Dept. of Biology.
U. M. Cowgill, and C. W. Burns.
Limnology and Oceanography, Vol. 20, No. 6, p. 1005-1011, 1975. 3 fig., 3 tab., 10 ref.

Descriptors: *Absorption, *Chemicals, *Plankton, Daphnia, Algae, Chemical analysis, Heavy metals, Connecticut.
Identifiers: Daphnia pulex, Daphnia magna, Euglena gracilis, New Haven(Conn.).

Water from West Spring in New Haven, Connecticut, containing 53 elements, was used to culture Daphnia magna and D. pulex and algae. Fifty-four elements were detected in the plankton. The Daphnia were fed with a monoculture of Euglena gracilis supplemented occasionally with mixed cultures containing E. gracilis and varying proportions of Chlorophyceae. A comparison of the mean concentration (dry weight basis) of the Daphnia species and the two algal cultures showed the Daphnia concentration factor of 17.5 for chlorine, 6.9 for calcium, and 4.5 for sodium over that of the algae which it consumed. Concentration factors of the order of two were shown by Daphnia for scandium, neodymium, lanthanum, zirconium, bromine, and nickel over those of the algae. The algae accumulated greater concentrations of molybdenum, iron, magnesium, tin, silver, titanium, beryllium, copper, zinc, iodine, manganese, phosphorus, aluminum, arsenic, cobalt, potassium, lead, mercury, and silica, and contained about the same concentrations of cadmium as Daphnia. The chlorine concentration in the algae was quite small, suggesting that they exclude it from their cells. The algae concentrated the elements in the order of thousands, and in some cases greater. The mercury concentration in the plankton was unexpectedly high but the source of the mercury was undetermined. (Auen-Wisconsin).
W76-06713

ACCUMULATION RATE AND TURNOVER TIME OF ORGANIC CARBON IN A SALT MARSH SEDIMENT,
North Carolina State Univ., Raleigh. Dept. of Zoology.
L. M. Cammen.
Limnology and Oceanography, Vol. 20, No. 6, p. 1012-1015, 1975. 2 fig., 2 tab., 7 ref. DACW-72-73-C-0025, NOAA 04-3-158-40.

Descriptors: *Cycling nutrients, *Carbon, *Sediments, *Tidal marshes, North Carolina.
Identifiers: *Carbon accumulation, Core Banks(N.C.), Drum Inlet(N.C.), Nutrient sources.

The rate of organic carbon production and the turnover time in Core Banks, a tidal salt marsh near Drum Inlet, North Carolina, were measureed in natural sediments, bare spoil, spoil planted with Spartina alterniflora, and planted spoil fertilized with N and P. The concentration of organic carbon from low intertidal areas showed a logarithmic decrease with depth. Organic carbon (g sp m) incorporated in the top 13 cm of the low intertidal bare spoil was 107.0, 116.0 for planted spoil, and 129.1 for fertilized spoil. The net rate of accumulation of organic carbon (g sq m/yr) was 80.3 in the bare spoil, 87.0 in the planted spoil, and 96.8 in the fertilized spoil. The turnover time was estimated to be 3.7 to 4.5 years. It appeared that the main source of organic carbon was not growth and decomposition of Spartina but more likely a combination of detrital matter carried in by tidal action and benthic algae. The unvegetated plot had accumulated almost as much carbon as the plots with abundant Spartina. Inasmuch as benthic algal production in North Carolina probably is between 79 to 99 g C sq m/yr, the benthic algae alone could have accounted for virtually all of the accumulated carbon. (Auen-Wisconsin).
W76-06714

DEVELOPMENT OF OXYGEN DEFICITS IN 14 SOUTHERN ONTARIO LAKES,
Trent Univ., Peterborough(Ontario). Dept. of Biology.
D. C. Lasenby.
Limnology and Oceanography, Vol. 20, No. 6, p. 993-999, 1975. 1 fig., 3 tab., 24 ref.

Descriptors: *Oxygen sag, *Hypolimnion, *Measurement, *Trophic level, Canada, Standing crop, Seston, Opacity, Lake sediments.
Identifiers: Ontario.

The usefulness of the hypolimnetic oxygen deficit as an indirect measure of standing crop was investigated in 14 southern Ontario lakes by comparing the deficit with a summer average for dry weight of seston and with Secchi depth in order to determine the importance of the choice of the upper limit of the hypolimnion in calculating the oxygen deficit and to test the linearity of its development. In 13 of the 14 lakes, the hypolimnetic areal oxygen deficit increased as the upper limit of the hypolimnion of theat lake was chosen at successively deeper levels. With the exception of one lake, the decrease was linear. Areal hypolimnetic oxygen deficits ranged from 0.006 to 0.41 mg sq cm/day and did not correlate with average dry weights of seston (an indication that they may not be related), but were negatively correlated with Secchi depth; the effect of this decrease on the calculated deficit suggest that real and possible causative relationships exist between the transparency of the water in the epilimnion and rates of oxygen depletion in the hypolimnion. (Auen-Wisconsin).

HE EFFECTS OF A BENTHIC GRAZER ON HE PRIMARY PRODUCTIVITY OF THE LIT-ORAL ZONE OF LAKE TAHOE,
alifornia Univ., Davis. Div. of Environmental tudies.
. W. Flint, and C. R. Goldman.
imnology and Oceanography, Vol. 20, No. 6, p. 35-944, 1975. 7 fig., 2 tab., 21 ref. NSF RANN GI-2.

escriptors: *Primary productivity, *Crayfish, Grazing, *Littoral, Aquatic plants, Periphyton, ypolimnion, Invertebrates, California, Nevada, ycling nutrients, Oligotrophy, California.
lentifiers: *Lake Tahoe(Calif), Pacifastacus niusculus.

he crayfish, Pacifastacus leniusculus, because of s dominant biomass in the littoral zone occupies a nique trophic position in Lake Tahoe. Submerged acrophytes above 50 m are scarce as are animal ood materials during much of the year, thus the rayfish population relies substantially on the lit-oral benthic periphyton for its food. This in-estigation was designed to establish what effect ie crayfish has on the littoral zone periphyton roduction and to assess the effects of its grazing n aquatic macrophytes and its role in the cycling of nutrients. The nutrient contribution y crayfish excretion serves as an important ource of ammonia which is converted to nitrate y heterotrophic activity and becomes directly vailable to periphyton. The importance of these utrients to the benthic community was shown by ie absence of any abnormal increase in nutrient vels in the water column and the lack of any verall increase in nitrogen in the lake indicated pid recycling of this nutrient. The relationship etween the crayfish and the benthic flora por-ays a dynamic balance between primary and econdary production in this extremely ligotrophic environment. The crayfish represents n effective 'cleanser' of the littoral area and pro-ides a stable food source for the lake trout. Auen-Wisconsin)

CTIVITY COEFFICIENTS OF BICAR-ONATES AND CARBONATES IN SEAWATER,
regon State Univ., Corvallis. School of Oceanog-phy.
. M. Pytkowicz.
imnology and Oceanography, Vol. 20, No. 6, p. 71-975, 1975. 5 tab., 21 ref. NR083-102, NSF ES-7201631, ONR N00014-67-A-0369-0007.

escriptors: *Analytical techniques, *Carbonates, Bicarbonates, *Sea water, Measurement, Esti-ating equations.
lentifiers: Activity coefficients.

ata on single ion and mean activity coefficients re of use in physicochemical studies such as the terpretation of the solubility behavior of inerals in seawater. Mathematical equations are esigned which allow the determination of the otal (stoichiometric) activity coefficients of bicar-onate and carbonate ions in seawater as a func-on of the salinity from ratios of the ther-odynamic and apparent dissociation constants of rbonic acid. This method makes it unnecessary resort to ion-pairing models and thus avoids any assumptions. The first comprehensive mean ctivity coefficients of bicarbonate and carbonate alts taken from various sources are compiled; owever their accuracy is unknown because of the ean-salt method assumptions and because the ccuracies of the various components used in etermination of the single-ion activity coeffi-ents of bicarbonate and carbonate have not been tablished. They should, therefore, be compared values obtained by independent means for carbonates as shown in the text. The single-ion ctivity coefficients of bicarbonate and carbonate resented as a function of salinity should be of use geochemists who seek fast calculations of the stribution of carbon dioxide species in sedi-ments. However, the values are only valid for pore waters with roughly the same relative composition as seawater. (Auen-Wisconsin)

SIMILARITIES BETWEEN THE UPTAKE OF NUTRIENTS AND INGESTION OF PREY,
M. Parker.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part I, p. 56-59, 1975. 6 ref.

Descriptors: *Productivity, *Digestion, *Absorption, *Predation, Mathematical models, Feeding rates, Equations.

The theorem is advanced that there may be a widespread unity in the process by which all organisms ingest food supported by the views that (1) both mouths and uptake sites are recycling entities performing similar functions; (2) that the Michaelis-Menton equation and Holling's (1965, 1966) equation, respectively, describe nutrient uptake by algae, etc., and ingestion by animals; (3) derive the Michaelis-Menton equation for animals possessing mouths; and (4) that the derived equation is similar to that of Holling. An equation depicts the ingestion process in a manner similar to an enzymatically catalized reaction, identifying the respective rate constants for obtaining, rejecting, and swallowing food, which generates equations expressing the rate of change in ingested food, food being processed, and food in the environment. If a steady state for mouths processing food is reached on a time scale short relative to changes in available and ingested food, and if mouths and food move randomly through the environment, and equation can be derived for the ingestion rate of one type of food. The generalizations are that: there are upper limits imposed on ingestion rates by the constraints of time, the law of nonsuperposition, and the fact that organisms and stomachs are finite in size; and that all ingestion is similar because of the recycling nature of both mouths and uptake sites. IDENTIFICATION AND MANAGEMENT OF EURASIAN WATER MILFOIL IN WISCONSIN,
Wisconsin Univ. Extension, Madison. Environmental Resources Unit.
S. A. Nichols.
Wisconsin Academy of Sciences, Arts and Letters, Vol. 63, p. 116-128, 1975. 4 fig., 1 tab., 25 ref.

Descriptors: *Aquatic weed control, *Plant morphology, Life cycles, Habitats, Reproduction, Harvesting, Wisconsin, Drawdown, Dredging, Light penetration, Mechanical control, Manual control.
Identifiers: *Eurasian milfoil, *Myriophyllum spicatum L., *Identification, Shading.

The identification of Eurasian milfoil (Myriophyllum spictaum L.) to differentiate it from the native Wisconsin variety (M. spictum var. exalbescens (Fernald) Jepson) is a prerequisite in a weed eradication program as only the invading specie restricts usage of lakes. A review of the morphological differences between the two types indicates that the Eurasian variety characteristically has 14 or more pairs of leaflets per leaf while the native variety ordinarily has less that 14 pairs of leaflets. The Eurasian variety has a wide ecological amplitude and its distribution is primarily governed by subtratum particle size, water depth, and water temperature. It has an affinity for alkaline waters and can utilize bicarbonate for photosynthesis. Its growth and reproduction is described. Repeated mechanical harvesting is effective in controlling milfoil; cleaning small problem areas with a rake is also beneficial. Habitat manipulation such as drawdown, dredging, and sand blanketing are also effective. Spot control of native milfoil was achieved by shading the surface of a farm pond with plastic sheeting. Recent research has indicated that milfoil has about the same protein content as alfalfa hay; also it has a high xanthophyll content, which may eventually make the species commercially valuable. (Auen-Wisconsin)

INFLUENCE OF WATERLOGGING ON MICROBIAL MINERAL WEATHERING, (IN FRENCH),
Centre National de la Recherche Scientifique, Vandoeuvre-les-Nancy (France). Centre de Pedologie Biologique.
J. Berthelin, and A. Kogblevi.
Rev Ecol Biol Sol 11(4); p 499-510, 1974.

Descriptors: *Microbiology, *Weathering, *Soils, Anaerobic conditions, Bacteria, Iron, Calcium, Magnesim, Manganese, Solubility, *Saturated soils.

A semi-continuous flow method was used for studying the influence of waterlogging on the microbial weathering of soil columns. One set of soil columns was waterlogged, the other normally drained. Sterile controls for both sets were made by addition of sodium merthiolate to the nutrient solution. The influence of waterlogging on net microbial solubilization process was depended on the chemical nature of the elements involved. It actively promoted the net microbial solubilization of Fe, Mn, and Ca at the beginning of the experiment. Net microbial solubilization of Si and Al decreased. Perfusion of 45 days resulted in leaching 129.5 mg of Fe2O3 from waterlogged nonsterile, 19.9 mg from normally drained, non sterile, 0.3 mg from waterlogged sterile, and 0.5 mg from normally drained sterile, columns. Corresponding weathering indices of Fe in waterlogged conditions was predominantly reductive process, since solubilized Fe was mostly ionic Fe and its production was correlated with very low Eh's (redox potentials) (-200 to -400mV). Waterlogging conditions decreased the aerobic microbial population, but it favored anaerobic bacteria and promoted the formation of organic volatile acids.--Copyright 1975, Biological Abstracts, Inc.

STUDY OF THE GENUS VIBRIO IN DRINKING WATER, (IN SPANISH),
Instituto Bacteriologico de Chile, Santiago.
J. H. Lobos, R. Greive, M. L. Quijada, and H. Brandt.
Bol Inst Bacteriol Chile 16(1/2), p 40-42, 1974.

Descriptors: Potable water, Epidemiology, Human diseases, Cultures, Salmonella, Pathogenic bacteria, Public health, Water pollution effects.
Identifiers: Cholera, *Vibrio.

Periodic study of the Vibrio genus for the diagnosis of cholera in the countries where it does not now exist is advisable. Recent epidemiological conditions have caused areas that are usually free from this disease to become infected. The prevalence of some species of Salmonella or other predominant enteropathogenic species can be investigated at the same time. This simple study can be done even with some culture media prepared in the laboratory.--Copyright 1975, Biological Abstracts, Inc.

PHOTOSYNTHETIC RATES OF PHYTOPLANKTON IN EAST AFRICAN ALKALINE, SALINE LAKES,
Duke Univ., Durham, N. C. Dept. of Zoology.
J. M. Melack, and P. Kilham.
Limnol Oceanogr. 19(5), p. 743-765, 1974.

Descriptors: *Photosynthesis, *Phytoplankton, Lakes, *Saline lakes, *Africa, Alkalinity, *Dissolved oxygen, Cyanphyta, Polarographic analysis.
Identifiers: Kenya, Tanzania.

Photosynthetic rates were calculated in 6 myxophycean-dominated alkaline, saline lakes in Kenya and Tanzania from changes in dissolved O2 in light and dark bottles and from diurnal variations in dissolved O2. Rates of gross photosynthesis are exceptionally high for Lake Nakuru, Kenya, by the diurnal free-water technique (e.g., 36 g O2 m-2 day-1). Gross photosynthesis in Lake Nakuru was compared for 2 consecutive days: on the 1st day pronounced thermal stratification developed and the dissolved O2 reached 340% saturation in the upper half meter; on the 2nd day wind-driven turbulence circulated the algae to depths often greater than 2 m in water with Secchi disk visibility of only 15 cm. Because of analytical difficulties in measuring dissolved O2 in soda lakes, laboratory experiments were conducted to determine the reliability of the titrimetric (Winkler, Miller), gasometric (Scholander) and polarographic (oxygen probe) methods. The polarographic technique was the most suitable for determinations of dissolved O2 in the field. --Copyright 1975, Biological Abstracts, Inc.

A TEMPERATURE-STRESSED STREAM ECOSYSTEM BELOW A HYPOLIMNIAL RELEASE MOUNTAIN RESERVOIR,
Colorado State Univ., Fort Collins. Dept. of Zoology; and Colorado State Univ., Fort Collins. Dept. of Entomology.
J. V. Ward.
Arch Hydrobiol. 74(2), p 247-275, 1974.

Descriptors: *Hyplimnion, *Colorado, *Ecosystems, Invertebrates, Reservoirs, Seasonal, Streams, *Water temperature, *Standing crops.

Biological, chemical and physical parameters were measured over a 12-mo. period at 4 sampling sites on the South Platte River below a Colorado mountain reservoir. Owing to the hypolimnial source, the stream temperature was higher than normal in winter, lower in summer, fluctuated less diurnally and seasonally and exhibited a seasonally displaced maximum. These effects decreased downstream, but still altered the temperature pattern 8.5 km below the dam. The number of species of macroinvertebrates progressively increased downstream, the temperature regime is probably responsible for the low diversity by failing to stimulate various developmental stages of the life cycle or by seasonally altering developmental patterns. The river below the dam is a temperature-stressed ecosystem, this is the major reason for the low diversity and large standing crop of macroinvertebrates. --Copyright 1975, Bilogical Abstracts, Inc.

A STUDY OF THE BENTHIC MACRO-INVERTEBRATES OF A SHALLOW EUTROPHIC RESERVOIR IN SOUTH WALES WITH EMPHASIS ON THE CHIRONOMIDAE (DIPTERA); THEIR LIFE HISTORIES AND PRODUCTION,
University of Wales Inst. of Science and Technology, Cardiff. Dept. of Applied Biology.
D. W. B. Potter, and M. A. Learner.
Arch Hydrobiol. 74(2), p 186-226, 1974.

Descriptors: Reservoirs, Lakes, *Eutrophication, *Invertebrates, *Diptera, Benthic fauna, *Life cycles, *Production, Water pollution effects.
Identifiers: Hirudinea, Isopoda, South Wales, Shallow reservoirs.

Production and life-history studies were carried out in 1970 and 1971 on the principal macro-invertebrate species and groups inhabiting the benthic deposits of a shallow eutrophic reservoir in South Wales (United Kingdom). The species studied belonged to the Chrionomidae (11 spp.), Tubificidae (2 species-groups), Hirudinea (1 sp.), Isopoda (1 sp.). Total production was about 37 g dry weight/m2/yr, 43% of which was chironomid production. Comparison is made with production estimates obtained for other lakes in Europe.--Copyright 1975, Biological Abstracts, Inc.

OWASCO LAKE AND ITS WATERSHED, A SUMMARY REPORT WITH TWO APPENDICES AND MAPS,
Cornell University, Ithaca, N. Y. Dept. of Natural Resources.
R. T. Oglesby, L. S. Hamilton, E. Mills, and P. Willing.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-251 939, $7.75 in paper copy, $2.25 in microfiche. Cornell University Water Resources and Marine Sciences Center, Technical Report No. 70, June 1973. 199 p, 2 append. OWRT B-030-NY(1), 14-01-0001-3832.

Descriptors: Water quality, *New York, Lakes, Watersheds(Basins), *Baseline studies, *Eutrophication, Water quality standards, Fish population, *Land use, Environmental effects, *Land development, Aesthetics, Mapping, Geomorphology, Slopes, Soils, Groundwater, Water pollution effects, Attitudes, Social values, Social change.
Identifiers: *Owasco Lake(NY), Environmental quality, Soil depth.

The following topics concerned directly with Owasco Lake and its tributaries, are considered: Establishment of a baseline description of water quality for comparison against any future changes that occur. Comparison of all water quality data collected since 1910 and that from the present study to see if any historical trends (particularly those that might indicate accelerated eutrophication of the lake) could be detected. A determination of the principal factors affecting water quality, with the exception of public health related parameters, for which County and State health authorities have clearly stated responsibilities. Some interactions between the Owasco Lake environment and the fish populations of the lake are described. The concept of limitations to land uses is presented as a means of maintaining environmental quality. Specific physiographic limiting factors such as slope, soil depth, flood susceptibility, and groundwater supplies are discussed and mapped on overlays. The constraints they offer to development are set forth. Aesthetic and cultured features which should not be damaged by incompatible development are identified and mapped on an overlay. A final composite of limiting features is presented as a planning guide to identify where on-site investigations may be needed to prevent loss of environmental quality when a change in land use is proposed. Management alternatives relating to land use in the Owasco basin are presented and discussed.

HYDROGRAPHICAL FEATURES OF NORDBYTJERNET, A MANGANESE-RICH MEROMICTIC LAKE IN SE NORWAY,
Oslo Univ. (Norway). Dept. of Limnology.
D. Hongve.
Arch Hydrobiol. 72(4), p 227-246, 1974.

Descriptors: Lakes, Europe, *Manganese, Hydrography, *Iron, Organic matter, Oxygen, Lake sediments, Water pollution effects.
Identifiers: Macrophytes, *Meromictic lakes, *Norway(Nordbytjernet), *Oxygen depletion.

Nordbytjernet is a meromictic lake where large concentratins of Fe and Mn have been found in the monimolimnion. The concentration of Mn is of an order of magnitude which is very remarkable in natural surface water. The special conditions depend upon large supplies of Fe and Mn which are continuously delivered by inflowing ground water. Large amounts of organic matter, mainly produced as macrophytes in the littoral, cause lack of O2 and reduction of Fe and Mn in the hypolimnion. The sediments also possess abnormal contents of Fe and Mn, which, according to the solubility products, must be precipitated as FeCO3 and MnCO3. --Copyright 1975, Biological Abstracts, Inc.

CONTROL OF SPECIES COMPOSITION IN ENRICHED MASS CULTURES OF NATURAL PHYTOPLANKTON POPULATIONS,
Skidaway Inst. of Oceanography, Savannah, Ga.
W. M. Dunstan, and K. R. Tenore.
Appl Ecol. 11(2), p529-536, 1974.

Descriptors: *Phytoplankton, *Algae, Aquaculture, Cultures, Nutrients, Eutrophication, Nitrogen, Phosphorus, Seasonal, Sewage effluents, Diatoms, Chlorophyta.
Identifiers: Cylindrotheca-Closterium, Silicon, Skeletonema-Costatum, Stephanopyxis-Costata.

The changes in species composition of intensively harvested outdoor cultures of enriched natural populations of micro-algae were studied using a variety of nutrient additions and dilution rates. The control of species in such semi-continuous outdoor cultures is not only important for aquaculture systems but is also helpful in identifying the effects of eutrophication on coastal phytoplankton populations. In a series of 3 experiments in which cells were counted and identified during the 6th-10th day of the daily 50% harvest, N, P and Si definitely favored the growth of diatoms. The addition of just N and P or N, P and trace metals stimulated a green microalgae population. Addition of treated sewage effluent resulted in a 70-80% diatom culture. In another series of experiments the rate of daily dilution was varied and in 2 experiments in June a clear control of species composition resulted. In 10% daily dilution green micro-algae dominated while at 75% dilution diatoms dominated particularly Skeletonema costatum (now Stephanopyxis costata). The results from experiments in July and Aug. were not as definitive as those in June and the ubiquitous diatom Cylindrotheca closterium prevailed at all dilution rates. --Copyright 1975, Biological Abstracts, Inc.

OBSERVATIONS AND EXPERIMENTS ON THE PHYTOPLANKTON OF BLELHAM TARN, ENGLISH LAKE DISTRICT I. THE EXPERIMENTAL TUBES,
T. J. Lack, and J. W. G. Lund.
Freshwater Biol. 4(4), p399-415, 1974.

Descriptors: *Phytoplankton, Limnology, Lakes, Seasonal, Tubes, Sampling, Algae, Europe.
Identifiers: Melosira-Italica-SSP-Subarctica.

Tubes composed on butyl rubber were placed in a small English lake in an area where the water is 11-12 m deep. Each tube, when fully distended, contained over 18,000 m3 of water. The tubes were anchored to the shore and lake bottom. A boat was rowed into them over a specially strengthened portion of the margin. The 1st was installed and its water isolated from that in the lake by the end of July 1970 and the 2nd tube at the beginning of Oct. 1970. The installation, maintenance and performance of the tubes are described; as are suggested improvements. The temperature regime in the tubes closely follows that in the lake. If the chemical conditions are favorable, the seasonal cycle of Melosira (italica ssp. subarctica) in a tube is similar to that in the lake. Contamination of the water in the tubes by that in the lake is slight and has a negligible effect on chemical conditions within them. Water can be lost from the tubes under certain conditions. The reverse does not happen. The phytoplankton communities in the tubes are similar in quality to those of the lake, even after 2.5 yr of separation. The tubes are apparently suitable for investigations on certain factors determining the abundance and seasonal cycles of algae in lakes and for other limnological studies. --Copyright 1975, Biological Abstracts, Inc.

J Mar Res. 32(3), p425-432, 1974.

Descriptors: *Aquaculture, *Oysters, *Trophic level, Detritus, Phytoplankton, Amphipoda, Cultures.
Identifiers: Capitella-Capitata, Corophium-Sp, Nereis-Virens, *Polychaetes.

The production of species belonging to the detrital trophic level was investigated in model-sized aquaculture system, with flowing, filtered seawater and controlled phytoplankton addition to experimental tanks containing the oyster, Crassostrea virginica. The biodeposits of feces and pseudofeces of the oysters supported on the bottom of 1 tank a population of the nereid polychaete, Nereis virens and in the other tank a mixed community of the capitellid polychaete, Capitela capitata and the amphipod, Corophium sp. The nereids showed a 2.8 fold increase in average weight of worm in 100 days and the Capitella-Corophium community reached a standing biomass of 24.4 grams carbon/m2. The feasibility of successful culture of such species in polyculture systems is suggested. Polyculture both increases and diversifies the crop production and eliminates the build-up of detrital wastes characteristic of simple food chains in aquaculture. --Copyright 1975, Biological Abstracts, Inc.

LAKE ELLESMERE, CANTERBURY, NEW ZEALAND: A REVIEW OF THE LAKE AND ITS CATCHMENT,
Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Ecology Div.
H. R. Hughes, R. H. S. McColl, and D. J. Rawlence.
N Z Dep Sci Ind Res Inf Ser. 99, p 1-27. 1974.

Descriptors: *Lakes, Eutrophication, Algae, Blue-Green algae, Canada goose, Fish, Swams, Trout, Weeds, Water pollution effects.
Identifiers: Lake Ellesmere(New Zealand).

Lake Ellesmere, New Zealand, and its agricultural catchment are described with special reference to the lake's biology and chemistry, and the interests of the management authority-the North Canterbury Catchment Board, farmers, commercial fishermen, sportsmen, and the general public. The lake, which is shallow and nutrient-rich, is periodically opened to the sea, allowing drainage and influx of sea water. Problems giving concern are eutrophication of the lake, the appearance of bluegreen algal blooms, the disappearance of aquatic weed beds supporting some of the water fowl, particularly black swan, the depredation of farmland by black swan and Canada geese (apparently as a result of reduced food supplies in the lake), the failure of the black swan to breed, deaths of commercial fish and difficulties in controlling lake level. Problems in contributing drains and waterways are the control of water flow and quality, excessive aquatic weed growth and the provision of sufficient water for irrigation while maintaining the trout fishery. Recommendations are made of practical methods for minimizing the deterioration of Lake Ellesmere and for further research to facilitate improved management.--Copyright 1975, Biological Abstracts, Inc.

THE IMPORTANCE OF THE EFFECT OF THE CHEMICAL COMPOSITION OF WATER ON THE POPULATION OF SNAILS: INTERMEDIATE HOSTS OF SCHISTOSOMES IN EGYPT,
Bilharziasis Research Inst., Cairo (Egypt).
A. A. El-Hassan.
Folia Parasitol (Prague). 21(2), p 169-179. 1974.

Descriptors: *Snails, Gastvopods, *Ions, Chemical properties, Population, Toxicity, Habitats, Distribution.
Identifiers: Biomphalaria-Alexandrina, Bulinus-Truncatus, Egypt, Schistosomes.

The effect of the chemical composition of water on the distribution of Bulinus truncatus truncatus and Biomphalaria alexandrina alexandrina, the 2 snail intermediate hosts of schistosomes, was studied. The lethal concentration of common ions present in fresh water for different stages of the snails was obtained. The least tolerant stages are newly hatched snails of both species. Biomphalaria snails are more tolerant than Bulinus snails to the examined ions. In the field, the concentration of various ions in water-bodies seldom reaches these lethal extremes. Some variations in the chemical composition of water were observed in habitats harboring each species. The restricted distribution of Biomphalaria snails in the Delta and its absence from Upper Egypt cannot be attributed to variations in the chemical constituents of water. Both the Delta and Upper Egypt contain water-bodies with microhabitats suitable for the establishment of both snail species. The chemical composition of water may indirectly influence the distribution of snail intermediate hosts by influencing the types and growth of microflora which is essential as food for the snails.--Copyright 1975, Biological Abstracts, Inc.

GENETIC DIFFERENCES IN SUSCEPTIBILITY TO TWO DISEASES AMONG STRAINS OF THE COMMON CARP,
Agricultural Research Organization, Dor (Israel). Fish and Aquaculture Station.
R. S. Hines, G. W. Wohlfarth, R. Moav, and G. Hulata.
Aquaculture. 3(2), p 187-197, 1974.

Descriptors: *Carp, *Fish diseases, Ponds, Fisheries, Fish management, Fish stocking.
Identifiers: Aeromonas-Liquefaciens, Israel, *Epidemal epithelioma.

In a test involving 5 inbred strains, and 9 strain crossbreds of the common carp, 1 inbred strain was infected by Epidermal epithelioma disease and a 2nd inbred strain was infected by a swim bladder inflammation. Crossbreds between these 2 strains, as well as between them and other strains did not show a single fish infected by either disease. Susceptibility to both of these diseases is probably controlled by recessive genetic factors. It appears that the decreased incidence of Epidermal epithelioma in Israeli fish ponds in recent years has been due to the increased use of selected crossbred carp fry. The incidence of Epidermal epithelioma was twice as high in experimental ponds with a high stocking rate than in those with a lower stocking rate. The swim bladder inflammation was apparently due to a blockage of the pneumatic duct, with secondary infection by Aeromonas liquefaciens.--Copyright 1975, Biological Abstracts, Inc.

ASSOCIATIONS OF BLUE-GREEN ALGAE OF THERMAL SPRINGS OF STRAVROPOL AND KRASNODAR KRAIS AND GEORGIAN SSR, (IN RUSSIAN),
Leningrad State Univ. (USSR).
V. N. Nikitina.
Vestn Leningr Univ Biol 1, p 54-59. 1975.

Descriptors: Algae, *Cyanophyta, *Thermal springs, Reservoirs, Plankton, Aquatic algae.
Identifiers: Krais, Krasnodar, Stavropol, *USSR(Georgian SSR).

A detailed description is given of some of the mineral springs of the Caucasus (Russian SFSR and Georgian SSR, USSR). Blue-green algae predominate in the springs studied. A small number of plankton forms are determined by the type of reservoir. The springs are shallow basins with running water, small streams and boils. Benthic algae predominate and form thick and loose films, coatings and accumulations. The type of film formed is determined by the morphology of the algae. The forms with a mucous cover form thick leathery films. Loose coatings and accumulations consist of nonmucilaginous algae. Thick films are found in reservoirs with rapidly flowing waters. The forms with a mucous cover prefer rapid waters, while the forms without vaginae prefer slow waters.--Copyright 1975, Biological Abstracts, Inc.

SEQUENCES OF EFFECTS OF A CITY SEWER: AS A FUNCTION OF THE REMOVAL OF THE SOURCE OF POLLUTION, ON THE PHOTOPHILE POPULATIONS GROWING IN EXPOSED PLACES (ALGAL FRACTION); FIRST RESULTS, (IN FRENCH),
Aix-Marseille-2 Univ. (France). Laboratoire de Biologie Vegetale.
T. Belsher.
Bull Soc Phycol Fr 19, p 158-163, 1974.

Descriptors: *Sewers, Vegetation, Algae, Cities, Europe, Water pollution sources, Bays, Harbors, Water pollution effects.
Identifiers: *France(Marseilles), Photophile, Populations, Ulvaceae.

The algal vegetation of the upper part of the infralittoral, in a polluted region near Marseilles (France), was investigated using new methods of phytosociology. This vegetation is characterized by a small number of species, an unusually small Margalef s index, and by the extreme scarcity of Ulvaceae. Near the sewer of Cortiou, Protofloridae form a dense cover on Corallina. This cover decreases westwards. Algal settlements growing in polluted areas are conspicuously different along open shores from those growing in sheltered bays and harbors.

THE MICROFLORA OF AEROBIC BACTERIA IN GRAVEL PIT LAKES, (IN GERMAN),
Sueddeutsche Versuchs- und Forschungsanstalt fuer Milchwirtschaft, Weihenstephan (West Germany). Bakteriologisches Institut.
K. Thurner, and W. Haber.
Arch Hydrobiol 75(3), p 347-365, 1975.

Descriptors: *Aerobic bacteria, *Lakes, Gravel, *Eutrophication, Ecological distribution.
Identifiers: Achromobacteria, Coryneform, *Gravel pit lakes, Pseudomonad.

A collection of 3300 aerobic bacteria was isolated from gravel-pit lakes of different age and ecological state. The bacterial flora was different in the various ecosystems. Coryneforms, pseudomonads and achromobacteria, in almost equal numbers, seem to be typical of unpolluted groundwater lakes. In a distinctly eutrophic lake with a high total-count, coryneforms were found at a much higher rate. In a 2nd eutrophic lake characterized by different ecological conditions, the bacterial floral consisted mainly of gram-negative bacteria. In the latter case the pattern of bacterial groups among gram-negative rods was different from the distribution found in the other lakes. Further studies are necessary to establish the ecological significance of these results.--Copyright 1975, Biological Abstracts, Inc.

THE EFFECT OF BACTERIAL SUBSTANCES ON THE GROWTH OF TWO CLADOPHORACIAE IN PURE CULTURE, (IN GERMAN),
F. Schanz, and E. A. Thomas.
Vierteljahrsschr Naturforsch Ges Zur 119(2), p 165-198, 1974.

Descriptors: *Eutrophication, *Cladophora, Algae, Growth rates, Cultures, Europe, North America, Lakes.
Identifiers: Agar, Europe, *Rhizoclonium, *Switzerland(Lake of Zurich), Thiamine, *Wisconsin.

The increasing eutrophication of European and North American waters has led to highly increased Cladophoraceae growth. Increasing amounts of water bacterium (S2) raised on plate-count agar increased the yield of Rhizoclonium clone R2, Cladophora 4 from the lake of Zurich (Switzerland) and Cladophora from Lake Mendota, Wisconsin (USA) when added to their culture water. Increasing amounts of water which covered the plate-count agar induced a similar increase in growth due to the yeast extract and trypton transferred from the plate-count agar to the water. Five bacterial clones from the Lake of Zurich were cultivated on glucose-glutamate agar which does not give off substances which promote the growth of Rhizoclonium and these bacteria produced substances which did agument algal growth. Maximal growth increase occurred when 3x10-9 g thiamine was added to 100 ml of culture water. Thiamine also significantly improved the growth of both Cladophora clones. Since corresponding amounts occur in natural waters, the thiamine content of a body of water is significant in determining the occurrence and mass development of Rhizoclonium and Cladophora. This is probably true for all Cladophoraceae.--Copyright 1975, Biological Abstracts, Inc.

CONTINUOUS CULTURES APPLIED TO ECOLOGICAL RESEARCH, (IN FRENCH),
Institut National de la Recherche Agronomique, Thonon-les-Bains (France). Station d'Hydrobiologic Lacustre.
J. Feuillade, and M. Feuillade.
Bull Soc Phycol Fr 19, p 94, 1974.

Descriptors: *Culture, Ecology, *Lakes, *Stratification, *Epilimion, Nutrients, Plankton, Nitrogen, Phosphorus, Enzymes, Production.
Identifiers: Oscillatoria-Rubescens.

The epilimnion of a stratified lake can be compared with a culture functioning as a chemostat fed by 2 sources of nutritive elements: the affluent source and the hypolimnion. This method of continuous culture seems to be well adapted to ecological studies of lake plankton. Oscillatoria rubescens D.C., a frequent nuisance in eutrophic lakes, was studied. In the 1st experiment the N and P consumption of this species was studied. The rate of growth of the algae reaches equilibrium, a characteristic of the chemostat culture, when N or P reaches zero. Chemical and biological tests at this point show good correlation between N and P consumption and production of dry algal matter. The production of alkaline phosphatases depends on the P flow. The quantity of available P in the medium influences enzyme activity inversely. No relationship was found between phosphatase production and P extractible from the algae by boiling water.--Copyright 1975, Biological Abstracts, Inc.

STUDY OF THE PHOSPHATE METABOLISM OF A DRINKING WATER RESERVOIR, (IN GERMAN),
R. Hofmann.
Int Rev Gesamten Hydrobiol 60(1); p 63-95, 1975.

Descriptors: *Phosphates, *Metabolism, Potable water, Reservoirs, Water supply, *Primary production, Sediments, Europe.
Identifiers: Asterionella-Formosa, Fragilaria-Crotonensis, *East Germany(Saidenbach Reservoir).

A study was made of Saidenbach Reservoir, Erzebirge, East Germany. The phosphate supply for the planktonic primary production comes almost exclusively from the influxes. The nutrient pool in the hypolimnion and in the sediment does not play a leading part. Evidently, that is often so in reservoirs. Both the phytoplankton (the most frequent species are Asterionella formosa and Fragilaria crotonensis) and the concentration of phosphate fractions are subject to considerable seasonal variations. The Asterionella spring maximum, typical of this reservoir, is released directly or indirectly by meteorological factors. An adequate orthophosphate concentration is a basic condition which is accomplished nearly every year. the autumnal Fragilaria maximum begins when a definite mixing depth has been achieved. The breakdown of diatom maximum is amost always caused by exhaustion of the phosphate reserves.

MARINE POLLUTION CONTROL: PART III--SHIP DESIGN REQUIREMENTS: THE DESIGN APPROACH,
Naval Ship Engineering Center, Hyattsville, Md. Environmental Pollution Control Branch.
A. E. Constant.
Naval Engineers Journal, Vol. 87, No. 5, p. 47-55, 1975. 4 fig, 3 ref.

Descriptors: *Oceans, *Water pollution control, *Ships, *Naval architecture, *Design, Waste disposal, Equipment, Solid wastes, Sewage treatment, Plumbing, Incineration, Oil wastes.
Identifiers: Compactors.

Techniques available to control shipboard generated wastes are discussed to stimulate interest in this area of ship design and to increase use of environmentally attractive systems and components. Correct location of pollution control equipment on ships will aid the crew and be less complicated and more economical to operate. Especially important are the needs for direct drainage flow and location of solid waste handling equipment. The discussion is directed to the Collection, Holding, and Transfer (CHT) systems. These systems are flexible, require only minor modification of existing plumbing, but require pier sewers or barging facilities, and entail only minor associated costs. There are two basic CHT systems. One uses a comminutor in the drain line into the holding tank, while the other uses an overflow box and inflow strainers. Incinerators, compactors, and food waste disposers needed to conform to regulations or requirements for shipboard generated solid waste disposal are described. The design for oil waste handling, stowage, transfer, and processing systems is discussed. Several suggestions are given for controlling oily ballast water. Residual oil should be removed from tanks and overflows from tanks arranged to prevent direct overboard discharge. (Buchanan-Davidson--Wisconsin)

UTILIZATION OF ANIMAL MANURES AND SEWAGE SLUDGES IN FOOD AND FIBER PRODUCTION,
Iowa State Univ. of Science and Technology, Ames. Council for Agricultural Science.
Report No. 41, February 1975. 27 p.

Descriptors: *Beneficial use, *Farm wastes, *Recycling, *Sewage sludge, Feeds, Fertilizers, Soil Amendments, Economics, Hazards, Sewage disposal, Salts, Sludge disposal, Agriculture, Heavy metals, Water pollution, Management, Land reclamation, Benefits, Public health, Crop response, Odor.

Proper use of animal manure and sewage sludges as fertilizers, soil additives, and animal feed could improve water and air quality and save fuel and feeds resources. Application to agricultural and forest lands is influenced by physical, chemical, microbiological, sociological, economic, political, and legal factors. Limitations to use as fertilizers are bulk, low quality, variable composition, inefficiency of application and expense of transportation. They may require drying, are difficult to store, and may contain large quantities of soluble salts (especially nitrates), heavy metals, pathogenic microorganisms, odors, etc. Fear of disease has hindered use of animal manure in animal feeds. Decreasing salts, trace metals, and bacteria accompanied by quality control would make these waste products more competitive with chemical fertilizers. Conservation of the ammonia produced and development of storage systems would be beneficial. Guidelines for use which are based on facts and acceptable risks and which can be interpreted in terms of local and regional conditions are needed to protect public health and environmental quality. Educational, research, and demonstration projects would improve management of sewage sludges and animal manures and would convince the population that their use can be beneficial. (Buchanan-Davidson--Wisconsin)

TECHNOLOGY AND $20 BILLION ADVANCE WASTEWATER TREATMENT EFFORT.
Engineering News Record, Vol. 195, No. 13, p. 18-19, 21-22, 24, 26, 29, 31. October 2, 1975. 5 fig, 1 tab.

Descriptors: *Water quality, *Sewage treatment, *Waste water treatment, *Sewage effluents, *Tertiary treatment, Filtration, Reverse Osmosis, Activated carbon, Phosphorus, Nitrogen, Biochemical Oxygen demand.
Identifiers: Water Pollution Control Act of 1972.

About $24.8 billion needs to be spent to treat the 30 billion gallons of wastewater which will be produced each day in the US by 1990. The technology to provide Advanced Waste Treatment (AWT) is available but the costs are high and there is also a backlog of secondary treatment projects designed to meet somewhat lower effluent standards which must be met by 1977. Problems must be approached on a case by case basis. Nature of the influent waste and receiving streams, and other factors are important. AWT can replace biological treatment with physical and chemical processes or it can refine secondary effluent. Removal of phosphorus has received top priority and is less expensive than removal of other wastes. Removal is accomplished by using lime, alum, or ferric chloride at one of several points in the treatment process. The additive reacts to form a solid which precipitates. Nitrogen removal is more difficult and more often questioned, though this element can be toxic to fish, corrode copper and increase chlorine consumption in disinfection. Removal of dissolved organics is accomplished with activated carbon, and is also possible through ozone oxidation though it is more expensive. However, this is less expensive than reverse osmosis, a process which removes almost all pollutants by forcing wastewater through a semi-permeable membrane of cellulose acetate. This is a high energy system useful in some industrial settings only. No single system can accomplish all treatment goals and the basic engineering involved is evolutionary not revolutionary. Costs are putting a severe strain on development. Prospect of meeting the zero-discharge objective of the Water Pollution Control Act of 1972 is dim. (Smith - North Carolina)

UPGRADING PRIMARY TREATMENT WITH CHEMICALS AND WATER TREATMENT SLUDGE,
Greeley and Hansen, Chicago, Ill.
T. E. Wilson, R. E. Bizzarri, T. Burke, P. E. Langdon, and C. M. Courson.
Journal Water Pollution Control Federation, Vol. 47, No. 12, p 2820-2833, December, 1975. 12 fig, 7 tab.

Descriptors: *Waste water treatment, *Suspended solids, *Biochemical oxygen demand, Coagulation, Nutrient removal, Polymers.
Identifiers: Chemical treatment, Sludge handling, Alum, Phosphorus removal.

In order to upgrade the quality of effluent water in Tampa, Florida, a study was undertaken to develop a chemical treatment program and a sludge handling program. A preliminary laboratory screening of processes indicated that a combination of alum and high-molecular weight anionic polymer woold be a promising coagulant. Other preliminary studies indicated that suspended

solids (SS) removal could be correlated with phosphorus removal and that there was a relationship between alum dosage and effluent SS concentration. During the main study alum and polymer were added to the influent on a 24 -hr/day basis and the alum was paced according to the orthophosphorus concentration. This concentration was about 2 mg/liter, corresponding to an estimated effluent SS concentration of about 30 mg/liter. The effluent SS remained below 30 mg/liter when the effluent orthophosphorus was below about 1.6 mg/liter. When chemicals were added the percentage removal and effluent concentrations of BOD and SS were superior to those when no chemicals were added. Because laboratory tests indicated that addition of water works sludge should improve performance and SS removal, it was attempted. Each time sludge was discharged to the system, performance suffered. It was then hypothesized that the sludge was being taken at too high a rate, and, upon regulation, the sludge was accepted. At times of high waste water flow or low water works sludge discharge, alum was necessary to maintain high removal efficiencies. The resulting raw sludge was slightly lower in solids content but no other significant changes from previous operation were noted. (Loustau-FIRL)

AN ECONOMIC STUDY OF THE UNOX AND CONVENTIONAL AERATION SYSTEMS,
J. M. Sidwick, T. P. Lewandowski, and K. H. Allum.
Water Pollution Control, Vol. 74, No. 6, p 645-656, 1975. 5 fig, 3 tab, 3 ref.

Descriptors: *Aeration, *Activated sludge, *Oxygenation, *Operating costs, *Capital costs, Biological treatment, Sewage treatment.
Identifiers: UNOX system.

The cost of the Unox treatment system was compared with conventional aeration systems. The Unox system differs from the activated sludge process primarily in that oxygen-enriched air is the source of oxygen for the microorganisms in the aeration tank. Although the process has been known for a long time, it was thought to be impractical cost-wise. A system using a staged reactor and a covered tank in such a manner as to achieved 90% utilization of the generated oxygen gas was linked up with an oxygen-production unit employing molecular sieves. The new system, the basis of the Unox system, allowed comparatively low cost production of oxygen in small tonnage requirements. Process parameters of the Unox system and the conventional activated-sludge system are given and the capital and operating costs are then compared. The total capital costs of the Unox plant were lower throughout the range of flows and treatment systems considered, but the operating costs were higher for the Unox system. The lowest plant capital costs resulted from treating unsettled sewage. The higher operating costs when operating on unsettled sewage offset any gains in reduced capital expenditure on these plants. Circular Unox treatment units were cheaper than rectangular for most of the systems considered. The Unox system offered a treatment process which was directly competitive with conventional aeration processes throughout the plant range studied. The process would be best operated on settled sewages in the United Kingdom to avoid any problems with sludge disposal. (Loustau-FIRL)

NOVEL AERATION SYSTEM BOWS,
Imperial Chemical Industries Ltd., Billingham (England). Agricultural Div.
D. A. Hines, M. Bailey, J. C. Ousby, and F. C. Roesler.
Water and Wastes Engineering, Vol. 12, No. 12, p 59-64, December, 1975.

Descriptors: *Aeration, *Waste water treatment, *Biological treatment, Separation techniques, Microorganisms, Activated sludge, Pilot plants.
Identifiers: Deep shaft.

A new aeration process for effluent treatment has been developed as a spin-off from basic aerobic fermentation technology for single cell protein development. Using a deep shaft, the process operates as a modified air-lift fermenter with air injection and may be used for municipal or industrial waste of any strength. It differs from the single cell protein production technology in that the air-lift type of fermenter not only provides biological oxidation but also provides the driving force for liquid circulation. A deep shaft, partitioned into two sections, forms the basis of the process design. Liquid effluent enters the apparatus continuously and is circulated by air pressure many times around the shaft during its time in the system. It then overflows by gravity for solids separation. To establish the effect of pressure oscillations on microorganisms in the activated sludge, a simple experiment was carried out. Nitrogen sparged at varying pressures through a vessel half-filled with activated sludge produced no decrease in viability or respiratory activity of the sludge. Electron micrograms and investigation by light-microscopy showed no evidence of cell rupture. Results from the deep shaft pilot plant have confirmed the validity of these initial experiments. The advantages of the deep vertical shaft are the minimal land requirement, the elimination of primary settlement, less sludge for disposal, the easily-supplied oxygen requirement, and the possible combination of activated sludge and aerobic digestion duties in a single shaft. (Loustau-FIRL)
W76-06289

MOVING BED FILTER PERFORMANCE STUDIES,
Research Triangle Inst., Research Triangle Park, N.C.
F. O. Mixon.
Chemical Engineering Progress, Vol. 71, No. 12, p 40-46, December, 1975. 6 fig, 2 tab, 5 ref.

Descriptors: *Filters, *Filtration, *Sewage treatment, *Waste water treatment, Equipment, Suspended solids, Recycling, Cleaning, Flow rates.
Identifiers: Moving bed filter.

The advantages of a new moving bed filter in treating both raw sewage and secondary effluents is that the filter medium is continually removed, cleaned, and recycled to the filtration zone. This moving bed contactor process should compete with and perhaps replace clarification, fixed bed filtration, microscreening and moving bed filters of countercurrent or crosscurrent design. The advantages of the moving bed contactor are that the equipment is simple, the filter can handle high and low suspended solids concentrations, the continuous operation feature simplifies materials handling and process automation, there is an inherent headloss stability, and its mechanism is analogous to graded filter media. In this moving bed process, the filter medium is slurried with incoming process feed and fed to the bottom of the moving bed contactor. Once inside, the filter medium rises because of buoyancy and viscous drag to the bottom of the performed porous plug of filter medium where it is deposited and thus replenishes the porous plug. Water is forced through the plug and is discharged by gravity at the lateral retaining screens, simultaneously undergoing filtration and forcing the plug slowly upward. At the top of the column, the emerging porous plug is harvested by a mechanical scraper and discharges filter medium into an auxiliary tank from which it is washed and returned to the process. After a year's testing, data showed that from 62 to 82% of the suspended solids in raw sewage was removed by the moving bed unit at flow rates ranging from around 3.5 to 7.5 gal/min/sq ft. THERMOPHILIC MICROBIOLOGICAL TREATMENT OF HIGH STRENGTH WASTE-WATERS WITH SIMULTANEOUS RECOVERY OF SINGLE CELL PROTEIN,
Illinois Univ. at Urbana - Champaign. Dept. of Civil Engineering.
G. A. Surucu, R. S. Engelbrecht, and E. S. K. Chian.
Biotechnology and Bioengineering, Vol. 17, No. 11, p 1639-1662, November, 1975. 10 fig, 3 tab, 38 ref.

Descriptors: *Waste water treatment, *Kinetics, *Aerobic conditions, *Thermophilic bacteria, *Biological treatment, Model studies, Chemical oxygen demand, Proteins, Biomass.
Identifiers: Solids retention time.

To determine the kinetic and operating parameters of a thermophilic system of waste water treatment, the kinetic coefficients of an aerobic thermophilic mixed culture system were calculated, the effects of solids retention time (SRT) on the biomass was demonstrated, and the economics of protein recovery were assessed. A mixed culture of thermophilic organisms from soil, streams, waste water, and silage was prepared and studied for various growth characteristics at 58 C in a medium containing glucose, the carbon source, and other nutrients. The biomass was then measured for cell mass, COD, and protein content. A series of experiments were performed at eight different SRT values. The resulting data were then applied to the Monod kinetic model. The kinetic parameters of saturation constant, substrate utilization rate, and death rate for a thermophilic system were much higher than those of a mesophilic system, while the yield coefficient was somewhat lower. Over 90% removal of soluble COD was observed with a SRT of two days and it improved with increasing SRT. The protein content of the biomass increased as the dilution rate decreased. However, because of a significant increase in the apparent cell yield with higher dilution rates, the net protein yield was found to increase with increasing dilution rates. A decrease in oxygen consumption per unit quantity of protein produced with increasing dilution rates also favored the economics of protein production. (Loustau-FIRL)

STATISTICAL DESIGN OF EQUALIZATION BASINS,
Hydroscience, Inc., Westwood, N.J.
D. M. Di Toro.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol. 101, No. EE6, p 917-933, December, 1975. 12 fig, 1 tab, 10 ref.

Descriptors: *Design criteria, *Statistical analysis, flow rates, *Waste water treatment.
Identifiers: *Equalization basins.

The major design problem in smoothing out fluctuations of concentration and mass flow rate in

equalization basin is to relate the characteristics of the fluctuating influent to those of the equalized effluent, as a function of the detention time. Presented here are the results and conclusion of two types of characterizations of the influent in graphical and tabular form suitable for design purposes. An analysis presented in subsequent sections addresses the questions of what are the statistics of the effluent concentration and effluent mass flow rate, and what is the probability that the effluent concentration exceeds a given design value. It is concluded that the equalization basin is a device that can be used to control variability in much the same way that conventional treatment units control mean values. As a post-treatment device, an equalization basin may be designed to meet variability criteria that would be difficult to achieve in the reactive units of the system. (Loustau-FIRL)

entifiers: Carbon substrates, Glucose, Sodium etate, Gallic acid, Flocs.

e effect of glucose, sodium acetate, and gallic d substrates on microorganisms of activated dge were studied. A synthetic activated sludge s cultured in sewage for four weeks and sams were removed every three days. Each sample s measured for the number and size of flocs; for number of flagelleta and the number of freeng, creeping, and settled ciliata by the direct unt method and the plate method; for volume ex; and for oxygen demand. Great differences re found in the appearance, size, and number of cs of the activated sludge cultures. In the sludge tured with sodium acetate, the flocs were nified. In the culture with glucose, the flocs re irregular and had folded margins and fine-in structure. In the gallic acid culture, the flocs re of a similar appearance but were much aller and twice as numerous. A greater number acteria were aggregated in the acetate and glue sewages than in the gallic acid sewage. The nber of free-living bacteria declined in the tate sewage, but remained constant in the glue sewage. In the gallic acid culture the number ree-living bacteria was greater than that of the regated organisms for the whole period of exment. Flagellata, which developed in the early of the experiment, decreased as settled ciliata eased. Purification of the glucose sewage hed 76%, that containing sodium acetate, , and that containing gallic acid, 61%. ustau-FIRL)

A FEW CONSIDERATIONS ON THE MEASUREMENT OF PORE SIZE DISTRIBUTION OF ACTIVATED CARBON (KASSEITAN NO SAIKOKEI BUNPU SOLUTEI NI KANSURU 2,3 NO KOSATSU),
S. Sato, K. Najima, K. Yoshikawa, and Y. Inagaki.
Mitsubishi Juko Giho, Vol. 12, No. 5, p 535-542, 1975. 14 fig, 5 tab, 12 ref.

Descriptors: *Waste water treatment, *Analytical techniques, *Activated carbon, Water treatment, Adsorption.
Identifiers: Pore size distribution, Activated carbon microstructure.

Increasingly stringent pollution control standards and the demand for the reuse of water have increased the use of activated carbon for waste water treatment. A study of the microstructure of activated carbon is important since the microstructure is closely related to the adsorbing performance of the carbon. The nitrogen adsorption method and the mercury pressure-penetration method were used to study the microstructure of activated carbon. The accuracies of these methods and analytical procedures are discussed. Measuring techniques for specific surface area, pore volume, and pore size distribution were established. Results from the investigations of the pore size distribution of activated carbon used for water treatment have shown that these analytical techniques can be used as important evaluating means for virgin carbon, spent carbon, and regenerated carbon. CONTROLLING POLLUTION FROM COMBINED SEWERS,
Hydrocomp, Inc., Palo Alto, Calif.
R. K. Linsley.
Simulation Network Newsletter, Vol. 7, No. 5, p 1-4, July 1, 1975. 4 fig.

Descriptors: *Storage capacity, *Sewage treatment, *Hydrology, Economics, Model studies, Economics, Flow, Simulation analysis, Flood control, Planning.
Identifiers: Hydrocomp Simulation Program(HSP).

If the 1985 target for pollution control is to be met, billions of dollars must be spent for storage facilities for sewage flows awaiting treatment. Determination of the required storage capacity is a hydrologic and economic problem. The Hydrocomp Simulation Program (HSP) is a continuous flow simulation that can give the most accurate estimates for storage requirements and configurations possible. HSP can also define the probability that the discharge of pollutants into receiving waters would exceed limits. If they did not, storage could be reduced. Since such probabilities would vary, even within the period of a day, the program must be produced very rapidly and accurately. The principle of flow storage is similar to that of flood control by reservoirs. The major differences are that the projected costs of flow storage are three times the expenditures to date on flood control, and that there are few records of sewer flows that can be used for design purposes. These factors necessitate the use of careful planning from simulated models. (Loustau-FIRL)

FULL AUTOMATION GOAL OF WATER RECLAMATION PLANT,
Brown and Caldwell, Inc., Walnut Creek, Calif. Process Control Div.
M. J. Flanagan.
Water and Wastes Engineering, Vol. 12, No 12, p19-24, 58, December, 1975. 5 fig, 3 tab.

Descriptors: *Computers, *Data processing, *Control systems, Treatment facilities, Waste water treatment, Water reuse, Biological treatment, Automatic control, Construction costs.
Identifiers: Water reclamation plant, Physico-chemical treatment.

A system of distributed digital processors and peripheral equipment is employed for data acquisition, process control and data management in a new 30 mgd water reclamation plant. The process control and management information system is

currently undergoing factory testing prior to delivery to the plant site. The entire digital system was connected to an analog computer programmed on a real time basis to simulate portions of the waste water treatment process. The system is built around a hierarchical network of digital computers consisting of two minicomputer systems and 24 microcomputer systems. The cost of the system, including all field instrumentation and telemetry equipment, represents 4.0% of the total plant construction cost. The system can be expanded whenever the plant is expanded. Both computer systems are provided with a real-time operating system so that either system can be assigned to real-time process control. The computers will regulate the functions of the plant processes, log operational data, schedule a maintenance program, keep an inventory, assign personnel, and store and retrieve historical data. The alarm system works in such a way that the operator is only informed of abnormal functioning. The plant in which the computer system will be installed is a physical-chemical-biological process and incorporates lime clarification in the primary sedimentation tanks, biological nitrification-dentrification, and a two-stage centrifugal classification and clarification process with recalcining and lime recovery. The denitrified plant effluent is filtered by a multimedia rapid sand filtration system and chlorinated prior to distribution for reuse by industry. (Loustau-FIRL)

Descriptors: *Waste water treatment, *Research and development, Activated sludge, Treatment facilities, Bacteria, Water pollution control, Nitrification, Sludge disposal.

Relative to problems in the waste water treatment industry, particularly aspects of sludge bulking, nitrification, and sludge disposal, some current fields of research are discussed. The settling characteristics of sludge have a considerable influence on the quality of final effluent. Deterioration in the settling properties of activated sludge, or bulking, is an ever-present threat to treatment plants. There are two theories on the causes of bulking: one is that a bulked sludge is one that has become grossly infected by filamentous microbes, and the other is that bulking is due to variations in the surface of the sludge. As a result of studies based on the latter theory, it has been suggested that the accumulation of lysozyme sensitive material in the sludge caused by the death of bacteria could be one cause of bulking. Another cause could be the depolymerization of slime layer polysaccharide. Since present standards for discharge are inadequate and the amount of nitrogenous matter converted to ammonia must be minimized, nitrifying systems are being studied. One solution calls for a separate nitrifying system in which the biomass is composed more or less exclusively of nitrifying bacteria and in which the sludge age is high. Another solution is submerged filtration in which there is a co-current flow of liquid and air upwards through a packed bed upon which the nitrifying flora develops. For the disposal of waste sludge, two possibilities show commercial potential. One use is the supplementation of animal feed, and the other is conversion into fermentation feedstock. (Loustau-FIRL)

ZERO DISCHARGE TO THE ENVIRONMENT OF DIFFICULT WASTEWATERS,
M. A. Elshazly.
In: Complete WateReuse: Industry's Opportunity, April 23-27, 1973, American Institute of Chemical Engineers and Environmental Protection Agency--Technology Transfer, p 147-151. 1 fig.

Descriptors: *Waste water(Pollution), *Waste water disposal, *Waste water treatment, *Chemical wastes, Industrial wastes, Oil, Costs, Incineration, Evaporation, Organic matter, Ultimate disposal, Water reuse.
Identifiers: Carver-Greenfield process, Waste streams, Multi-evaporation process, Zero discharge.

Contaminated waste waters from the chemical processing industry vary so much in composition that treatment by chemical or biological methods is very difficult. Such wastes were previously dumped in deep wells, dumped in the ocean, or incinerated. A multi-evaporation process, called the Carver-Greenfield process, has been used in the food processing industry successfully and is now finding application in the recycling and ultimate disposal of chemical wastes. Oil is added to the liquid waste and the water is evaporated. The resulting moisture free oil-solid suspension is separated by centrifugation. Since tighter environmental standards have made the cheaper methods of disposal ecologically unsound, the Carver-Greenfield process previously considered too costly, is becoming a viable alternative. Two types of waste streams are considered. The first is 20,000 lbs/hr with 7% dissolved organic material from a pharmaceutical manufacturer, and the second is 117,000 lbs/hr, containing 9% oil and 3% solids from an oil refinery. In the first plant, incineration was adopted at a cost of 169,000 dollars. If the Carver-Greenfield process were used, it would cost 92,000 dollars per year. In the second plant, incineration costs 1,018,500 dollars, while the Carver-Greenfield process costs 350,000 dollars. (See also W76-05314) (Pinto-FIRL)

Pennsylvania State Univ., University Park. Dept. of Forest Hydrology.
B. R. Edgerton, W. E. Sopper, and L. T. Kardos.
Compost Science, Vol. 16, No. 5, p 10-15, Autumn, 1975. 1 fig, 4 tab, 5 ref.

Descriptors: *Waste disposal, *Sludge disposal, *Toxicity, *Land reclamation, Model studies, Environmental effects, Irrigation, Leachates, Nitrogen, Waste water(Pollution), Eutrophication.
Identifiers: Renovation, Acid mine drainage, Land application.

Stripmining causes acid mine draining that can result in a sterile aquatic ecosystem. In order to try to ameliorate the toxicity and acidity of strip-mine spoil, a study was conducted on the changes effected by effluent and sludge irrigation on spoil material. In a model study, boxes of highly toxic spoils were planted with legume and grass seeds, and irrigated with amounts of effluent and sludge. Upon analysis of spoil and leachate chemical composition, it was found that effluent and sludge treatment of the spoil material could ameliorate the conditions of toxicity and acidity. Leachate nitrogen levels may be increased, however, resulting possibly in detrimental eutrophication of waterways. (See also W76-03821) (Loustau-FIRL)

ANAEROBIC DIGESTION OF SLUDGE, PART II,
Pirnie (Malcolm), Inc., Paramus, N. J.
A. F. Weland, and P. N. Cheremisinoff.
Water and Sewage Works, Vol. 122, No. 11, p 45-47, November, 1975. 3 fig, 1 tab, 30 ref.

Descriptors: *Design criteria, *Anaerobic digestion, *Biological treatment, Waste water treatment, Alkalinity, Toxicity, Equations, Kinetics, Sludge treatment.
Identifiers: Solid retention time.

The design parameters of anaerobic digestion are reviewed, with emphasis placed on specific advantages and disadvantages of the process. The physical parameters of anaerobic digestion are detention time, temperature, influent solids concentration, mixing, and solids loading. Temperature and detention time are interrelated. If bacterial growth is stimulated by temperature, the stabilization rate increases. Solids retention time is generally 10 to 15 days. Solids retention time (SRT), solids loading, and volatile solids concentration are also interrelated. If solids loading is 0.10 lb VSS/cu ft/day and SRT is 10 days, then a minimum of 1.5% volatile solids is required. The chemical parameters of anaerobic digestion are pH, alkalinity, volatile acid, nutrients, and toxic materials. Alkalinity and pH are interrelated. Ideal environmental conditions are pH values of 6.6 to 7.4. The ratio of volatile acids to total alkalinity should be approximately 0.5. Sludges from sewage treatment plants and meat packing houses contain all the necessary nutrients, but wastes containing carbohydrates of fats require additional nutrient or seed materials. Industrial wastes are usually the cause of toxicity. This may be eliminated or reduced by dilution, precipitation, use of antagonist ions, process by-pass, or process modification. An equation was developed for the kinetics of digestion. The development of high rate systems has improved the overall efficiency of anaerobic digestion, but recent advances in incineration processes indicate a trend toward the replacement of the digestion process. EVALUATION OF IN-LINE AND SIDE-LINE FLOW EQUALIZATION SYSTEMS,
G. W. Foess, J. G. Meenahan, and D. Blough.
Water and Sewage Works, Vol. 122, No. 11, p 59-60, November, 1975.

Descriptors: *Waste water treatment, *Treatment facilities, Biochemical oxygen demand, Municipal wastes, Flow, Evaluation.
Identifiers: *Flow equalization.

Despite advantages ascribed by various investigators, flow equalization has not been widely applied in the municipal pollution control field because of uncertainties in the areas of costs and beneficial effects. Two waste water treatment facilities, one employing side-line equalization, and the other employing in-line equalization, were evaluated for

mpact on waste water characteristics, treatment rocess performance, and plant operating costs. oth equalization systems were highly effective in moothing influent flow variations and providing a niform flow rate to the process units. However, ontrary to previous statements, each system exibited only limited effectiveness in concentration veling. A five percent BOD reduction was noted ross the in-line basin. Overall removal of soluble hosphorous and effluent quality appeared to be naffected by flow equalization. (Loustau-FIRL)

CTIVATED BIO-FILTER PROCESS,
. F. Owen, and A. F. Slechta.
ater and Sewage Works, Vol. 122, No. 11, p 60, ovember, 1975.

escriptors: *Biological treatment, *Filters, iltration, Microorganisms, Ammonia, iochemical oxygen demand, *Waste water treatent, *Activated sludge.
entifiers: Cost-effectiveness, *Bio-filters.

e two-stage activated bio-filter process, emoying both fixed film and activated sludge ological reactors, is a new development in seconry treatment. The ABF is unique in that fixed d suspended growth microorganisms are utilized the first-stage reactor, called the 'bio-cell'. The ocess includes a bio-cell lift station, a fixed film actor, flow control and splitting, a short detenn aeration basin, a clarifier, and return sludge cilities. In a trial run at Corvallis, Oregon, the BF system, with an influent NH3-N concentran of 45 mg/liter and a bio-cell loading of 350 lbs OD day/1,000 cut ft, removed over 90% BOD d ammonia. The ABF can be applied for any ological waste treatment system. Low power and d use requirements make it suitable for muipal treatment plants. Standard techniques are ed in design, construction, and operation of the BF system. It has been shown to be cost-effece because the efficiency of the first-stage treatnt necessitates only a small second-stage aeran basin. (Loustau-FIRL)

GIONAL WASTE WATER DEVELOPMENT AN: ANALYSIS OF EXISTING FACILITIES.
mo Area Council of Governments, San Anio, Tex.
l. Parts I, II, III. Various Paging. 30 fig, 2 tab.

scriptors: *Regional development, *Waste atment, *Quality control, Water quality, Waste posal, Water analysis, Basins, Sanitary eneering, Biochemical oxygen demand, *Texas, eatment facilities, *Waste water treatment.
ntifiers: *San Antonio(TX), Cibolo Creek(TX).

43 waste treatment facilities within the San onio AACOG planning region have been lyzed by design criteria of the Texas State Dement of Health. Plant design, component and rall capacities, and effluent quality sampling lts for each plant are reported. It is recomded that the 19 treatment plants within the posed City of San Antonio Regional System be solidated to 3 facilities, and that the remaining lants be phased out. Extensive sampling dur- the past 6 months indicates that there is espread inadequacy in treatment. The Texas er Quality Board has set standards for maxn allowable BOD (Biological Oxygen Dd) at 27 mg/l and TSS (Total Suspended ds) at 27 mg/l on any grab sample of processed ent. These standards were exceeded in almost of the BOD tests and almost 60% of the TSS . It is also proposed that wastewater from the nts in the Cibolo Creek water-shed be cold and treated at two regional plants to be ated by the San Antonio River Authority. pling at these six plants shows that BOD stans are being exceeded in 40% of the samples TSS are above the standards in 70% of the samples. The remaining 17 plants in the region consist of 15 serving small rural communities and 2 operated by the US government. These facilities will not be made part of the regional system within the next few decades, although almost 90% of these facilities fail to meet the standards half the time, indicating a need for improved levels of treatment. MINE AND MILL WASTEWATER TREATMENT.
Environmental Protection Service, Ottawa (Ontario). Water Pollution Control Directorate.
Environmental Protection Service, Economic and Technical Review Report EPS 3-WP-75-5, December 1975, 141 p, 30 fig, 23 ref, 19 tab.

Descriptors: *Effluents, *Mills, *Mine water, Wastes, Mine drainage, Runoff, Comsumptive use, Treatment facilities, Water pollution, Metals, Mining, Wastes, Costs, Acid mine water, Canada.
Identifiers: *Tailings, Canadian practice.

This report reviews the origin of water borne wastes (mine drainage, mill process effluent and surface runoff) encountered in metal mining and milling operations, and the associated chemical processes resulting in contaminated effluents. It deals with the types of contaminants normally encountered in wastewaters discharged from the industry and the technology currently employed for the abatement and control of water pollution. The design and operation of the most widely used treatment facility, the tailings pond, is covered in some detail. Treatment of acid mine water in the newer mechanical treatment systems is also reviewed, particularly with reference to the 5 lgpm pilot plant project recently completed at the Brunswick Mining and Smelting Company. One section deals with the economic impact of effluent treatment on the mining industry. The costs of constructing and operating sound environmental control systems are discussed. The data and method suggested for deriving such costs should prove helpful to professionals involved in the estimation and control of environmental protection costs. Several case studies covering treatment costs are included. (Environment Canada)

REMOVAL OF PHOSPHATES AND METALS FROM SEWAGE SLUDGE,
Waterloo Univ. (Ontario). Dept. of Chemical Engineering.
D. S. Scott, and H. Horling.
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 28, Training and Technology Transfer Division (Water), Environmental Protection Service, Environment Canada, Ottawa, Canada, (1973) 55 p., 11 fig., 19 ref., 8 tab. 73-5-7.

Descriptors: *Phosphates, *Sewage, Metals, Iron, Sludge, Heavy metals, Aluminum, Costs.
Identifiers: *Metal extraction, Organic material.

Most of the metals and phosphorus in either unconditioned or conditioned final anaerobically digested sludges can be readily extracted by acid. The acid extract can be neutralized under controlled conditions of pH to yield a solid product low in organic material containing mostly iron and aluminum phosphates. By proper control of pH, it is possible to produce two solid products, one containing most of the iron and aluminum, and one containing most of the heavy metals. Iron and phosphate can be separated and recovered from the crude inorganic product by known solvent extraction technology, or by alkali treatment. Costs are such that if metals and phosphates are removed from a sludge, then it is profitable to recover and recycle the iron and phosphate from the crude inorganic product. However, the value of recovered metals and phosphates is not sufficient to bear the cost of the entire process. (Environment Canada)

PROCESS OF REMOVING AMMONIACAL NITROGEN FROM WASTE WATER,
Iwao Engineering Co., Inc., Tokyo (Japan). (Assignee).
T. Hiasa, and H. Ishimard.
U.S. Patent No. 3,929,600, 9 p, 1 fig, 6 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 941, No 5, p 2224, December 30, 1975.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Water pollution control, Water quality control, Ammonia, *Nitrogen compounds, Nitrogen, Chlorine adsorption, Electrolysis, Ion-exchange, Hydrogen ion concentration, Separation techniques, Chemical reactions.
Identifiers: *Ammonia nitrogen removal.

A method is disclosed for removing the ammonia nitrogen by conversion of the ammonia nitrogen to the inert nitrogen in a closed system, recycling the treating liquid, to prevent secondary pollution and by successive treatment, such as adsorption, elution electrolysis, adjustment of pH, and cleansing, of the drainage containing the ammonia nitrogen to improve removing ability. The ammonia nitrogen in effluent from waste water treatment plants is adsorbed in an ion-exchange substance such as zeolite and is eluted by treating the ion-exchange substance with a treating liquid containing mainly alkali metal chlorides to regenerate it. The treating liquid containing the ammonia nitrogen is electrolyzed to produce active chlorine which decomposes oxidatively. The gas generated by the decomposition is brought into contact with an adjusting liquid, containing a hydroxide of the same alkali metal as that used in the treating liquid. The adjusting liquid which has adsorbed the acid gas is added to the electrolyzed treating liquid to adjust hydrogen ion concentration, to supplement the alkali metal ion and decompose the remaining ammonia nitrogen by the recovered active chlorine. Finally the treating liquid is recirculated, after cleansing by passing through active carbon to decompose residual chlorine to the initial ion-exchange process. (Sinha - OEIS)

SUBMERGED MULTIPORT DIFFUSERS FOR COOLING WATER DISCHARGE,
Massachusetts Inst. of Tech., Cambridge, Mass. (Assignee).
G. H. Jirka, and D. R. F. Harleman.

U.S. Patent No. 3,934,599, 4 p, 13 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 942, No 4, p 1712, January 27, 1976.

Descriptors: *Patents, *Cooling water, *Thermal pollution, *Water pollution sources, *Waste water treatment, Electric powerplants, Diffusion Dispersion, Mixing, Temperature.
Identifiers: Multiport diffusers.

Submerged multiport thermal diffusers are devices for the discharge into ambient water bodies of large quantities of heated cooling water primarily from electric power generation. The need for such devices stems largely from environmental considerations, which require considerable mixing of the heated water, and hence temperature reduction, in order to limit ecological damages. For typical conditions the amount of required mixing, i.e., the dilution, varies between five and twenty. Furthermore, this mixing has to be obtained within relatively small areas, depending on the locality. The multiport diffuser has a main pipe for submerged disposition at or near the bottom of a large body of water. It has a large number of nozzles oriented at predetermined variable angles to the axis of the pipe, the angle of orientation being a function of the axial location of the particular nozzle and the half-length of the main pipe. PROCESS FOR THE TREATMENT OF WASTE WATERS CONTAINING SULFURIC ACID AND/OR AMMONIUM SULFATE,
Institut Francais du Petrole, Paris. (Assignee).
J. Alagy, C. Busson, and M. Cessou.
U.S. Patent No. 3,935,100, 7 p, 4 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 942, No 4, p 1873, January 27, 1976.

Descriptors: *Patents, *Waste water treatment, *Chemical wastes, *Industrial wastes, Water pollution treatment, Water pollution control, Water quality control, Chemical reactions, Separation techniques, Sulfates, Sulfides, Sulfur.
Identifiers: *Sulfuric acid, *Ammonium sulfate, Barium sulfide.

A process for treating a waste water containing sulfuric acid and/or ammonium sulfate comprises the steps of: reacting the waste water with barium sulfide, introduced at least partly in the solid state, so as to form a suspension of solid barium sulfate in waste water; reacting the resulting barium sulfate at high temperature with carbon (containing inorganic impurities) so as to form solid barium sulfide (containing inorganic impurities) and a gas which is separated; recycling to the first step at least the major portion of the formed solid barium sulfide; and dissolving in water a minor portion of solid barium sulfide from the second step, separating the resulting solution from the insoluble impurities. At least one portion of the resulting purified solution of barium sulfide is transferred to the first step. In this method sulfur can be recovered and recycled. (Sinha - OEIS)

AUTOMATIC FOAM REMOVER FOR FLOTATION TANKS,
Waste Water System, Inc., Hoffman Estates, Ill. (Assignee).
C. E. Russell, F. E. Russell, and M. B. Pearson.
U.S. Patent No. 3,935,104, 4 p, 8 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 942, No 4, p 1874, January 27, 1976.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Water pollution control, Water quality control, Industrial wastes, *Foam separation, Flotation, Separation techniques.
Identifiers: Vacuums.

An automatic foam removing apparatus is described for use in an industrial flotation system for the separation of suspended solids and immiscible liquids from a body of water. In a rectangular flotation tank gas bubbles are formed which rise through the waste water body carrying insoluble and immiscible matter with them to the surface to form a layer of froth, foam or sludge. The surface is maintained at a constant level by overflows. The foam remover comprises a hollow beam extending horizontally across the top portion of the tank and having its bottom edge at a distance above the waste water level with a downward open slot extending along the bottom edge. An elongate flat-faced vane is mounted within the hollow beam for pivotal movement on a horizontal axis above the slot and extending downward through the slot to a level below the surface. A conduit provides communication between a vacuum source and the interior of the hollow beam. The beam moves back and forth by means of a motor driven endless chain. Movement of the beam in one direction tends to cause compression of the foam in front and causes the vane to pivot into engagement with the rear edge of the slot and thus subjects the foam to the suction action and discharge of the foam through the conduit. The operation is repeated during the reverse movement of the beam with the vane in engagement with the other edge of the slot. (Sinha-OEIS)
W76-06474

TUBULAR FILTER IN SETTLER,
Henry Mfg. Co., Inc., Bowling Green, Ohio. (Assignee).
S. N. McEwen.
U.S. Patent No. 3,935,105, 6 p, 11 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 942, No 4, p 1875, January 27, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, Water pollution treatment, Water pollution control, Water quality control, *Filtration, *Filters, Settling basins, Suspended particles, Separation techniques.
Identifiers: Filter cake.

A separator for solid particles from a liquid, such as a dirty industrial machine tool coolant, comprises a settling tank with one or more frames or assemblies of horizontally extending tubular filters. Such frames are removably clamped against the side of the settling tank over suction outlets. Each of the filter frames has a chamber into which all of the tubular filters connect. Socks are provided for the tubular filters and may contain seams that are aligned in vertical planes for the easy severance of the cakes of solid particles which build up upon them. A bottom drag out conveyor may be provided for the settling tank and a suction pump draws the liquid through the filters into an adjacent clean tank. When the coating of removed solid particles on the tubular filters becomes excessive a predetermined vacuum occurs on the intake of the pump, the suction may be automatically shut down, and reverse pressure applied to the filters to bump off the cake that has formed on the filters so it can settle and be removed from the settling tank. If required a precoat filter medium may be applied to the filters. (Sinha - OEIS)

PROCESS FOR DEWATERING A PROTEINACEOUS, AQUEOUS SLUDGE AND FOR REMOVING AND RECOVERING PRECIPITATING AGENTS FROM A PRECIPITATE CONTAINING PROTEINACEOUS SUBSTANCES,
Apothekernes Laboratorium for Specialpraeparator A/S, Oslo (Norway). (Assignee).
P. Nettli.
U.S. Patent No. 3,936,375, 7 p, 5 fig, 7 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 943, No 1, p 336, February 3, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Proteins, *Sludge treatment, Coagulation, Agglomeration, Chemical reactions, Separation techniques, Heating, *Dewatering, Hydrogen ion concentration, *Chemical precipitation.
Identifiers: Precipitating agents.

The object of the invention is to condition proteinaceous sludges by addition of a suitable coagulating agent, so that heating of the sludge being conditioned in this manner yields a rapid and satisfactory coagulation and agglomeration of proteinaceous organic material, and the coagulated material can be removed by sedimentation, preferably in a centrifuge. The process provides a method for treating a proteinaceous sludge and comprises a chemical-thermal combination method yielding a concentrated proteinaceous sludge with a high content of solids simultaneously with the utilized precipitating agent going into solution in the separated aqueous phase and thus renders it possible to recover the precipitating agents. The conditioned sludge is mixed with calcium chloride, and treated with a base selected from the group consisting of alkali metal hydroxides and alkaline earth metal hydroxides to adjust the pH to a value in the range of 6.5-9.5. The mixture is then heated to a temperature in the range of 60 deg - 120 deg C. to coagulate and agglomerate the sludge, which is then separated from the aqueous phase containing the precipitating agent. (Sinha - OEIS)
W76-06478

SEWAGE TREATMENT APPARATUS,
J. Pacaud.
U.S. Patent No. 3,936,381, 4 p, 5 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 943, No 1, p 338, February 3, 1976.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Domestic wastes, Water pollution treatment, Water pollution control, Water quality control, *Aeration, Turbulence, Water purification, Odor, Activated sludge, Application equipment.

The apparatus for the treatment of domestic sewage water is comprised of an outer tank and an inner tank which is placed within the outer tank to form a space between the vertical walls. The bottom of the inner tank is formed in such a way that light particles are prevented from ascending into the clarification tank. An aeration system provides a sufficient upwards suction of water for

iomogenizing, aerating and recirculating the ludges. The upper end of the clarification tank an be closed to permit trapping of fines of light articles in suspension which have been formed in he clarification tank. Nozzles slightly above the vater level are provided for the evacuation of the ght particles. A floating member protects the noz- les against the turmoil created by the aeration tur- ine. Treated or purified water is discharged hrough an outlet above the water level every time here is a new arrival of sewage water. (Sinha - OEIS)

VAPORATION APPARATUS OF SPECIAL IATERIAL,
ooker Chemicals and Plastics Corp., Niagara alls, N.Y. (Assignee).
E. Houston.
.S. Patent No. 3,937,646, 6 p, 1 fig, 11 ref; Offi- al Gazette of the United States Patent Office, ol 943, No. 2, p 812, February 10, 1976.

escriptors: *Patents, *Water purification, Alkali metals, *Industrial wastes, *Water quality ntrol, Water pollution control, Water pollution eatment, *Evaporation, Heating, Separation chniques, *Evaporators, Heat exchangers.
entifiers: Alkali metal hydroxides, Alkali metal lorides, Ferritic stainless steel.

he invention provides an evaporation apparatus r use in the evaporation, concentration and pu- ication of aqueous solutions containing alkali etal hydroxides and alkali metal chlorides, both th and without alkali metal chlorates. The ap- ratus has a liquid receiving chamber for the aterial to be processed, a flow through heating ne containing heat transfer elements, a separa- n chamber for forming a liquid-vapor mixture, ssageways connecting the chambers and zones d baffle and distribution means positioned with e chambers, zones and passageways. Those sur- es of the chambers, zones, passageways, baffle d distribution means of the apparatus which are contact with the solution of alkali metal hydrox- -alkali metal chloride material at temperatures excess of about 50 deg C consist of a ferritic inless steel. By the use of this material of con- uction, there is obtained an evaporation ap- ratus which may be successfully operated over a ad range of operating conditions and over ex- ded periods of time without the necessity for ng shut down for replacement of component ts due to corrosion and/or stress cracking, but ich cost appreciably less than comparable ap- ratus fabricated from nickel. CORRELATION OF RADIOACTIVE WASTE TREATMENT COSTS AND THE ENVIRONMENTAL IMPACT OF WASTE EFFLUENTS IN THE NUCLEAR FUEL CYCLE FOR USE IN ESTABLISHING 'AS LOW AS PRACTICABLE' GUIDES--APPENDIX A. PREPARATION OF COST ESTIMATES FOR VOLUME 1, MILLING OF URANIUM ORES,
Oak Ridge National Lab., Tenn.
A. D. Ryon, and R. E. Blanco.
Report No. ORNL TM-4903, Vol. 2, May 1975. 259 p. W-7405-eng-26.

Descriptors: *Waste treatment, *Industrial wastes, *Radioactive wastes, *Costs, Estimated costs, Dusts, Effluents, Solid wastes, Wyoming, New Mexico, Landfills, Operating costs, Capital costs, Facilities, Underground storage, Nuclear wastes.
Identifiers: *Uranium ore mills.

The methods used to estimate the capital and operating costs of alternate installations required for treating radioactive wastes at model uranium mills at Wyoming and New Mexico are detailed. Chemical and equipment requirements are based on model acid-leach solvent-extraction and for alkaline leach mills processing 2000 tons ore per day. Capital costs, in mid-1973 dollars, for treatment of solid and liquid mill effluents by the acid metho range from $284,000 to $20,257,000; perating costs range from $61,000 to $4,809,000. Capital costs for the alkaline method range from $279,000 to $7,538,000 and operating costs vary from $61,000 to $6,302,000. Seven alternate treatment procedures for airborne emissions are described and represent $88,000 to $3,942,000 capital costs and $10,800 to $67,600 in operating costs. The annual fixed charge is 24% of the capital cost and the contribution to power cost is based on the total uranium oxide requirements of a power reactor over its life. The capital costs cover installation, piping, instruments, utilities, design, engineering, and construction, and a 40% allowance for interest during construction and for contingencies. The operating costs were computed by estimating labor, supplies, and maintenance requirements for the waste treatment processes applicable to the uranium milling industry and include a 15% allowance for contingency expenses. REFINERY EFFLUENT WATER TREATMENT PLANT USING ACTIVATED CARBON,
Atlantic Richfield Co., Carson, Calif.
G. C. Loop.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-244 389, $5.50 in paper copy, $2.25 in microfiche. Report EPA-660/2-75-020, June 1975. 92 p, 30 fig, 10 tab. EPA 1BB036 12050 GTR.

Descriptors: *Activated carbon, Adsorption, Organic loading, Oxygen demand, Pollution abatement, Settling basins, *Waste water treatment, Carbon regeneration, *Chemical oxygen demand, Treatment facilities.
Identifiers: Intermittent carbon treatment plant, Calgon process.

Reduction of Chemical Oxygen Demand (COD) in petroleum refinery effluent wastewater by adsorption onto activated carbon was demonstrated on a commercial level during a two-year project at Carson, California. The plant contained over 750,000 pounds of carbon, regenerated 1,644,000 pounds of carbon, processed 172 million gallons of water, and removed 408,000 pounds of COD. The carbon was exhausted at the rate of 9.5 pounds per 1000 gallons of water processed. At an average feed COD concentration of 250 ppm and an average effluent COD concentration of 50 ppm, the carbon was loaded to an average of 0.26 pounds of COD per pound of carbon. Following solution of initial startup problems, the unit was operated at a cost of 40 cents per 1000 gallons of water treated, or 18 cents per pound of COD removed. (EPA)

INFRARED DRY CAUSTIC VS. WET CAUSTIC PEELING OF WHITE POTATOES,
Western Potato Service, Inc., Grand Forks, N. Dak.
O. Sproul, J. Vennes, W. Knudson, and J. W. Cyr.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-244 408, $4.50 in paper copy, $2.25 in microfiche. Report EPA-660/2-74-088. June 1975. 64 p, 12 fig, 26 tab, 11 ref. 12060 EIG. EPA 1BB037.

Descriptors: Environmental engineering, *Food processing industry, Potatoes, *Industrial wastes, *Waste treatment, *Waste water treatment.
Identifiers: *Potato processing wastes, *Infrared dry caustic system, *Wet caustic system.

The infrared dry caustic peeling system has been evaluated through plant scale comparisons with the conventional wet caustic system. The following significant differences were noted when the dry peel system was compared to the wet process: (a) decreased peel loss by 13.1 percent. (b) decreased caustic consumption by 26 percent. (c) decreased wastewater from peeling by 73 percent. (d) decreased BOD5 in the peeler wastewater by 78 percent. (e) decreased suspended solids in the peeler wastewater by 77 percent. (f) decreased alkalinity in the peeler wastewater by 61 percent. (g) increased operating costs of peeling by 39 percent but decreased total annual cost of peeling and primary treatment through lower peel loss by 10 percent. (h) decreased total plant raw waste load: water use by 18 percent, BOD5 by 47 percent, and suspended solids by 57 percent. No significant differences were noted in the efficiency of primary sedimentation of the raw wastes nor in the mud clarifier results. Primary sludges and their dewatering characteristics were similar. (EPA)
W76-06652

WATER POLLUTION ABATEMENT THROUGH FOREST IRRIGATION WITH MUNICIPAL WASTE WATER,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
W. E. Sopper.
In: Groundwater Pollution - Symposium (Proceedings of the Moscow Symposium) August 1971. 17 p, 10 tab, 11 ref. IAHS-AISH Publication No. 103, 1975. OWRT B-001-PA(9), B-047-PA(5). 14-31-0001-3639. 14-01-0001-837.

Descriptors: *Waste water treatment, *Waste water disposal, Pollution abatement, Surface waters, Recharge groundwater, Groundwater reservoirs, Environmental sanitation, Disposal, Abatement, Crop production.
Identifiers: *Forest irrigation, *Municipal wastewater, *Land disposal, Wood fibre increase.

Serious pollution problems are often created by the disposal of municipal waste water into surface waters. An obvious alternative method is diversion of these waste waters to the land. Such non-aqueous methods of disposal might eliminate or alleviate many water pollution problems and, in some cases, could even provide secondary benefits such as recharge of groundwater reservoirs, and increased production of crops and wood fibre. Research results during the past 8 years from the Pennsylvania State University Waste Water Renovation and Conservation project indicate that large volumes of municipal waste water can be successfully disposed of through irrigation of forest land. With properly programmed application rates, waste water can be satisfactorily renovated and considerable amounts of high-quality water recharged to the groundwater reservoir. In addition, secondary benefits such as increased tree growth, increased site productivity, and site amelioration have also been obtained. The deliberate reclamation of waste water for potential reuse is one of the keys to optimum utilization of water resources. (Sink-Penn State)

YBBARPSAN-A SMALL RECEPTACLE FOR A LARGE INDUSTRY: WATER CONSERVATION ACTION IN THE VICINITY OF PERSTORP AB, (IN SWEDISH),
I. Borgstrom, and G. Grankvist.
Vatten 29(4), p 418-428, 1973.

Descriptors: Water conservation, Europe, *Activated sludge, *Waste water treatment, *Treatment facilities, Biochemical oxygen demand, Organic wastes, Water reuse, Industrial wastes.
Identifiers: Ybbarpsan.

The steps taken by Perstorp AB, a chemical and plastics manufacturing firm in Sweden, to eliminate pollution from its wastewater are discussed. A wastewater treatment plant based on activated sludge process was constructed. The plant is constructed for an addition of 3000 kg BOD7 (biological oxygen demand) a day. The wastewater to be treated contains mainly aldehydes, alcohols, organic acids and their salts. The efficiency of BOD7-reduction is about 90%. Experiences for 2 yr of plant operation are presented.--Copyright 1975, Biological Abstracts, Inc.

PHILADELPHIA'S SOLID WASTES STRATEGY STRESSES PRIVATE SECTOR PARTICIPATION,
Philadelphia Dept. of Streets, Pa.
D. J. Damiano.
Refuse Removal Journal, Solid Wastes Management, Oct. 1975, Vol 18, No. 10, p 40, 50-52, 53.

Descriptors: *Management, *Solid wastes, *Waste disposal, *Municipal wastes, *Pennsylvania, Land reclamation, Long-term planning, Econimics, Railroads, Strip mines, Financing, Energy conversion, Incineration, Recycling.
Identifiers: *Philadelphia(Pa), Demonstration projects.

The strategy adopted by Philadelphia for handling urban solid wastes is described. Alternatives to local and New Jersey landfills were needed, thus a plan was conceived to rail haul solid wastes for reclamation of abandoned strip mines. After examining alternatives, use of private business, rather than government, appeared advisable. Bidders' qualifications were the ability to remove up to 1000 tons waste/day to remote disposal sites subject to rigid ancillary requirements. A public/private financing system was devised. An energy recovery feasibility study recommended a new 1600 ton/day thermal conversion facility, upgrading of continuous-feed incinerators, and conversion of four batch-fed incinerators to transfer stations. With other components of the city's disposal system, 15,000 tons refuse/week could be handled. The plan is being evaluated and financing is being studid. Another study is being conducted on the marketability of energy and materials recovered from municipal refuse. After examining various alternatives, Philadelphia is using the legal, financial, and managerial capabilities of the private sector. The emergence of private stockholder-owned companies in the municipal refuse field is a new development and a segment of innovative, long-range planning. (Buchanan Davidson--Wisconsin)
W76-06199

TWO MILLION YARDS OF BURIED REFUSE MOVED.
Refuse Removal Journal, Solid Wastes Management, p. 10-12, October 1975.

Descriptors: *Relocation, *Landfills, Sites, *New York, Compaction, Estimated costs, Barges, Excavation, Transportation, Pollution abatement, Odor.
Identifiers: *Landfill relocation, Buffalo(NY), Odor control.

In 1973 the Sewer Authority of Buffalo, New York, decided to build a secondary wastewater treatment plant on a 20-year-old landfill site containing over 2 million cubic yards of compacted refuse. It was decided to move the material by barge to a site miles away. Estimated costs were about $10,250,000. An impervious barrier was built around the perimeter and a leachate collection system installed to prevent waste liquid escape to the new site. Refuse excavation was done with specially equipped dozers. A clamshell crane lifted out large items which might clog the conveyor. The refuse was carried by conveyor to the river where barges transferred about 20,000 tons a day. Care was taken to avoid spillage where the conveyor crossed a service road. The main environmental problem was odor. When crossing the service road, refuse was wetted down with Odab odor modifier in the winter; in the summer, Chemscreen odor modification system formed an odorabating vapor. Tarpaulins covered barges and dump trucks were used to carry refuse to the new site to prevent blowing trash. Refuse was spread, compacted, covered with soil, and seeded with fescue and bluegrass, thus creating a new park. (Buchanan-Davidson--Wisconsin)
W76-06223

EFFICIENT IN-HOUSE HANDLING OF SOLID WASTE,
R. A. Young.
Pollution Engineering, Vol. 7, No. 1, p. 43-1975. 1 fig.

Descriptors: *Solid wastes, *Waste disposal, Incineration, Automation, Equipment, Costs, Economic efficiency, Waste treatment.
Identifiers: In-house waste collection, Commercial wastes, Warehouses, Hospitals, Conveyor systems.

Refuse collection and transport to disposal areas usually accounts for more than 75% of solid waste management costs. Handling wastes by automated methods can improve efficiency of refuse disposal and reduce costs. Bamberger's Distribution Center, Raritan Center, New Jersey, generates an estimated 18,000 cubic yards of waste per year in their warehouse. It uses a towcart system to move supplies and remove solid wastes to an incinerator. Trash carts are located where refuse is generated. Bamberger's Department Store, Langhorne, Pennsylvania, creates about 600 cubic yards uncompacted waste monthly. A storewide conveyor system leads to an automatic shredder and compactor which continuously supplies waste to an incinerator through a drop chute. Cost was about 100,000. Alachua Hospital, Gainesville, Florida, has a dual pneumatic tube system. The same air stream moves trash to the incinerator or laundry to the laundry room. Trash accumulates in a hopper until the desired weight, then is emptied by an attendant into an incinerator; this last operation is being automated. The type and amount of solid waste will determine what type of mechanized equipment is required and if savings are possible over manual methods. (Buchanan-Davidson--Wisconsin)
W76-06224

DEVELOPER'S PLANS DETAIL TRASH COLLECTION SYSTEM.
Refuse Removal Journal, Solid Wastes Management, Vol. 18, No. 1, p. 20, 22, 58, 1975.

Descriptors: *Municipal wastes, *Sanitary engineering, *Solid wastes, *New Jersey, Costs, Contracts, Compaction, Equipment, Recycling.
Identifiers: *Waste collection, Shopping centers, East Brunswick(NJ), New Brunswick(NJ), South Amboy(NJ), Paper recycling(NJ), Commercial wastes.

The trash collection system at the Brunswick Square Mall, East Brunswick, New Jersey, is the Bobbey Refuse Handling System. All, except two stores which have their own waste pickup contracts, compact their waste in individual compactors. Waste from each store is metered. Stores must comply with strict standards for handling waste. Compacted material is removed to a nearby landfill site by Jersey Sanitation, Inc. This firm also handles residential collections for New Brunswick, East Brunswick, and South Amboy. The contracts require pick up of all residential trash at a fixed overall fee, thus imposing economic efficiency. Because some alleys are small, pickup trucks haul trash to the street, where it is transferred to rear loading trucks. About 10,000 people are served with a pickup truck and a two-man crew. Private two-way radios link trucks and foremen who oversee the residential pickups. The areas served are small and close to landfill sites. The company is also experimenting with paper recycling. Garden apartment complexes are being encouraged to segregate paper and shopping malls are encouraged to keep corrugated materials out of the compactor. (Buchanan-Davidson--Wisconsin)

CAERNARFON SLUDGE GOES UP IN SMOKE,
M. C. Bailey, and J. G. Palmer.
Surveyor, Vol. 146, No. 4355, p 18-21, November, 1975. 2 fig.

Descriptors: *Incineration, *Sludge treatment, *Dewatering, *Sludge disposal, Centrifugation, Odor, Sulfur, Sewage treatment, Treatment facilities, Design.
Identifiers: Fluidized bed reactor.

A fluidized bed reactor was chosen for the new incineration plant being installed in the tourist town of Caernarfon, United Kingdom. Incineration was chosen over other sludge disposal methods because it takes place at the treatment plant site and it is odorless. Disposal of sludge as fertilizer was not suited to the grazing land around the town, and drying the sludge in open beds is not practical due to the average 60 inches of rainfall each year. The Caernarfon sludge will not be dry enough to be autothermic, so supplementary fuel oil will be necessary. To remove the sulfur from the gas emissions produced not only by the sludge waste but also by the fuel oil, a dry gas cleansing system with limestone or dolomite will be annexed to the incinerator. Particulate matter and heat will be recovered in a heat exchanger. Since the incinerator requires preliminary dewatering of the sludge, centrifuging was selected as the most economical and the simplest dewatering method. A feature of the centrifuge is the 100% standby capacity that insures that the incinerator will never be out of action if the dewatering plant fails. The total sewage treatment works were designed to cope with flows from a population of 12,500 but can be expanded to handle flows from a population twice that size. The treatment plant construction is completed and the incinerator is scheduled to be completed by March, 1976. (Loustau-FIRL)

SLUDGE DISPOSAL ALTERNATIVES,
Camp, Dresser and McKee, Inc., Boston, Mass.
A. A. Kalinski, A. B. Pincince, M. H. Klegerman, and T. F. X. Flynn.
Water and Sewage Works, Vol. 122, No. 11, p 61, November, 1975.

Descriptors: *Incineration, *Burning, *Sludge disposal, *Costs, Fertilizer, Energy, Sludge treatment.
Identifiers: *Pyrolysis.

Incineration or pyrolysis was found to be the most cost-effective, technically feasible, and environmentally acceptable method for disposing sludge, according to the results of a study funded by the EPA for the New York-New Jersey area. The study took into consideration that the present sludge production of 600 tons/day may expand to 2000 tons/day by the year 2000. It was assumed, based on present values, that the volatile solid content would be about 50% of the total, and the fuel value of the total solids would be approximately 5,000 Btu/lb. An average value of 4% solids was assumed. The choice of incineration as the best method was made in comparison with disposal of either liquid digested sludge or dewatered sludge cake on a strip mine area 100 miles from the study area. In this comparison, the total cost of disposal was over double the net cost for incineration or pyrolysis. The possibility of producing a commercial fertilizer from the sludge was not even comparable to incineration due to the high expense of fertilizer production. The incineration process includes sludge conditioning with chemicals and use of filter pressing to obtain a 40% solids sludge cake. During normal operation, the system for incineration or pyrolysis will consume no auxiliary fuel, except if afterburning is required, and the energy recovery will supply all electrical requirements of the sludge processing facility. Moreover, there will be a significant amount available for other uses. (Loustau-FIRL)

EVIDENCE FOR NEW ALUMINUM PHOSPHATE PHASE FROM REACTION RATE OF PHOSPHATE WITH ALUMINUM HYDROXIDE,
Agricultural Univ., Wageningen (Netherlands). Dept. of Soils and Fertilizers.
W. H. Van Riemsdijk, F. A. Weststrate, and G. H. Bolt.
Nature, Vol. 257, No. 5527, p 473-474, October 9, 1975. 2 fig, 1 tab, 8 ref.

Descriptors: *Phosphates, *Nutrient removal, Kinetics, Waste water disposal, Aluminum, Chemical precipitation, Soils, Sewage disposal, Pollutant identification, Analytical techniques.
Identifiers: Aluminum phosphate, Sterrettite.

In systems where waste water is disposed directly onto the soil, the reaction between phosphate and aluminum hydroxide is an important one. It has been suggested that the precipitation of phosphate occurs when raw sewage water is applied to sandy topsoil for an extended period of time. The presence of an aluminum phosphate has been indicated as the main fraction of phosphate retained. Experiments on this precipitation reaction were performed at 20.5 + or minus 0.1 C with an initial phosphate concentration of 0.36 mmol/cu dm at a pH of 5. Results of the measurements are presented in a semi log plot of the measured phosphate concentration as a function of reaction time for a suspension concentration of 0.2 g/cu dm A1(OH)3. An increase in reaction rate on the graph was hypothesized to be due to the initiation of the growth of a crystalline aluminum phosphate. This supposition was tested using electron microscopy, electron diffraction, and X-ray diffraction. From the results, crystalline structures with a measured value agreeing with those of sterrettite were found. Evidence indicated that the growth of an aluminum phosphate phase was the rate determining step after a particular point on the graph. (Kramer-FIRL)

SIGNIFICANCE OF TRACE METALS AND NITRATES IN SLUDGE SOILS,
Environmental Protection Agency, Columbus, Ohio. Div. of Waste Management and Engineering.
R. E. Brown.
Journal Water Pollution Control Federation, Vol. 47, No. 12, p 2863-2875, December, 1975. 3 fig, 7 tab, 39 ref.

Descriptors: *Trace elements, *Soil analysis, *Heavy metals, *Zinc, Toxicity, Sludge disposal, Fertilization, Metals, Nitrates, Environmental effects.
Identifiers: Land application.

There is substantial potential for damage to the productivity of soils that are fertilized with waste water sludge, if no restrictions are made on the metal and nitrogen accumulations in the soil. A comparison of sludge-amended soils and soils that received no sludge showed that extractable zinc increased many times in sludge-amended soils. In addition, almost all of the applied zinc remained in an extractable form, thus presumably more available for plant uptake than metals in soils that have not received sludge. One report attributed crop damage in 24 cases to application of sludge. Another report showed that sludge applications that increased zinc by approximately 340 lb/acre

LIBRARY OF THE UNIVERSITY OF ILLINOIS

produced no metal toxicity in corn grown on the site. Although data are not available to evaluate long-term effects of metals in sludge, it is generally agreed that, on a short-term basis, the addition of metal salts to soils without sludge would be more likely to cause metal toxicity conditions in plants than would an equivalent amount of metal from waste water sludge. Concerning nitrate pollution, there is no question of the fact that nitrate content of drainage waters from a sludge disposal site would be excessively high if no restrictions were placed on application. Dilution of the drainage water by groundwater or receiving water could minimize the hazard. In the case of sludge application to crop soils, the nitrogen application must equal the sum of gaseous nitrogen losses and the nitrogen requirement of the crop. Any excess would become a hazard in leachate groundwater. Because of the many variables, amounts of nitrogenous sludge applicable to soils should be determined on a site-by-site basis. (Loustau-FIRL)

HYDROLOGICAL AND HYDROGEOLOGICAL ASSESSMENT OF LANDFILL SITES,
R. Aspinwall.
Solid Wastes, Vol. 65, No. 8, p 390-403, August, 1975.

Descriptors: *Solid wastes, *Landfill, *Waste disposal, Rainfall, Drainage, Public health, Soil chemical properties, Soil physical properties, Aquifers, Environmental effects, Aquifers.

The variables of a solid waste disposal pit are the amount of rainfall, the overall catchment area of the pit, the actual top of the excavation, the volume of waste going into the pit, and the catchment area which must be controlled by artificial drainage works. If a pit is lined with impervious clay, the leachates will not seep away and the pit will fill up with water not only from rainfall but also from liquid wastes that have no other disposal system available. In England it was estimated that there are some 500 million gallons of liquid waste produced annually that are unacceptable for incineration or mineshaft disposal and are probably being dumped anywhere space can be found. For pit disposal in the present clay lined type, a conservative estimate of 30-acre pits needed for waste disposal would be 12 new pits a year. In addition, this solution of waste disposal produces water pollution and health hazards. A new model of landfill site has been proposed: a permeable earth medium on top of a permanent saturation. The chemical properties of the earth, especially with some clay present, would remove heavy metals and degrade the leachate. At the saturate zone the leachate would be diluted with existing groundwater and travel a long distance to a safe discharge point in the sea or a river. Such a site would be considered an aquifer and an important national asset as a water storage and collection site. Local water authorities might object to the idea, but the need for safe waste disposal must be weighed against the loss of some aquifers. (Loustau-FIRL)

STAGONOSPORA FOLICOLA, A PATHOGEN OF REED CANARYGRASS SPRAY-IRRIGATED WITH MUNICIPAL SEWAGE EFFLUENT,
Agricultural Research Service, University Park, Pa. Regional Pasture Research Lab.
K. E. Zeiders.
Plant Disease Reporter, Vol. 59, No. 10, p 779-783, October, 1975. 1 fig, 1 tab, 10 ref.

Descriptors: *Sewage effluents, *Irrigation, *Waste disposal, Waste water(Pollution), Water pollution effects, Fungi, Plant pathology.
Identifiers: Leaf disease, Reed canarygrass, Stagonospora foliicola.

A field of reed canarygrass (Common) which was spray irrigated with municipal sewage effluent was found to have a foliar disease resembling tawny blotch. Adjacent fields of reed canarygrass with no irrigation had no disease. This occurrence prompted an investigation of the etiology of the disease and studies of the pathogen. The causal fngus, taken from infected reed canarygrass, was isolated from diseased tissue and identified as S. foliicola. Two tests were then made to determine conditions favorable for infection and disease development. Potted ramets of Common reed canarygrass from the irrigated field were inoculated by spraying with a conidial/mycelial suspension of S. foliicola until thoroughly wet. In the first test plants were kept in various combinations of chamber, temperature, and exposure periods, and it was found that disease development was better in plants kept 72 hours in a dew chamber. In the second test, time-of-exposure in a dew chamber was varied, and again disease development was better in plants given a 72-hour incubation period. Of eight species inoculated, only one, P. arundinacea, was susceptible to the disease. These studies indicated that the build-up of tawny blotch on reed canarygrass will be favored by two factors: plants remaining uncut throughout the growing season so that more leaves are exposed to inoculum of the fungus for a prolonged period of time, and periods of three days of cool weather and abundant moisture for infection and disease development to be initiated. The effect of the plant nutrients in the effluent water on disease development was not known because there were no areas irrigated with 'pure' water for comparison. (Loustau-FIRL)

EFFECT OF SEWAGE SLUDGE ON SOME SOIL PHYSICAL PROPERTIES,
Agricultural Research Service, Beltsville, Md. Agricultural Environmental Quality Inst.
E. Epstein.
Journal of Environmental Quality, Vol. 4, No. 1, p 139-142, January/March, 1975. 7 fig, 2 tab, 10 ref.

Descriptors: *Sludge disposal, *Sewage sludge, *Soil physical properties, Soil water, Waste disposal, Hydraulic conductivity.
Identifiers: *Land application.

The effect sewage sludge application to soil has on soil water retention, hydraulic conductivity, and aggregate stability at 15, 25, and 35 C for 175 days, was determined by weight measurement and the presence of pH and carbon. Raw sludge retained twice the amount of water retained by digested sludge. The two digested sludge treatments (high and low pH) retained approximately 10 times more water than the soil control. With higher temperatures, available water decreased with time and reached equilibrium faster, suggesting that the changes in water retention were related to microbial activity. However, the total carbon contents of the soil-sludge mixtures did not change greatly. Although hydraulic conductivity varied among sludge soil samples initially, after 79 days the hydraulic conductivity was essentially the same. The percent stable aggregates for sludge treatments after 175 days were essentially the same, averaging 34%, compared to 17% in untreated soil control. Temperature had little effect on aggregate stability. This information could affect decisions on disposal of municipal wastes. Rather than dumping sludge into landfills or the ocean, or burning sludge in incinerators, sludge could be added to soil, producing greater soil stability, water infiltration, and water movement. (Loustau-FIRL)

Canada-Ontario Agreement on Great Lakes Water Quality, Research Report No. 16, Environment Canada, Ottawa, Canada, Training and Technology Transfer Division (Water), Environmental Protection Service, 1972. 39 p, 3 fig, 16 tab, 8 ref.

Descriptors: *Waste water disposal, *Sewage disposal, * *Agriculture, Nutrients, Heavy metals, Leaching, Erosion, Soils, Lime, Runoff, Nitrogen, Water quality, Groundwater, Pollutants, Microorganisms, Coliforms, Bacteria, Hydrogen concentration, Groundwater movement, *Sewage sludge.
Identifiers: *Chemically-treated sludge, Nitrogen transformation, Aluminum sulphate, Ferric chloride, Phosphorus removal.

This study was designed as the first part of a three to five year project to determine the rates at which chemically treated sewage sludges may be safely applied to agricultural land. Initial experiments with sludges resulting from sewage treated with lime, aluminum sulphate, and ferric chloride are described. The sludges were applied to three different soils at rates based on the total nitrogen content of each sludge. The following aspects of sludge application to soil were investigated: rate of nitrogen transformation to soluble forms when chemical sludges are incorporated into sand - soil mixtures; bacterial contamination of runoff and groundwater; the macromorphology, micromorphology, and the chemical and physical states of the soil prior to application; the effect of sludges on plant growth; and nutrient and heavy metal uptake by plants. BUFFALO HARBOR DIKED DISPOSAL SITES: ENGINEERING PROPERTIES AND DRAINAGE CHARACTERISTICS,
State Univ. of New York Coll. at Buffalo.
D. L. Wright, and R. R. Rumer, Jr.
NYSSGP-SS-75-028, December 1975. 12 p, 3 fig, 1 tab, 3 ref, append.

Descriptors: *Harbors, *Sewage disposal, *Dikes, *Drainage, Landfills, Coastal engineering, Engineering structures, Sanitary engineering, New York, Lake Erie.
Identifiers: *Buffalo harbor(NY), *Diked disposal sites, Slag dikes, Fill material, Drainage networks.

The objective was to determine the engineering properties of the placed fill material and the drainage characteristics of diked disposal sites in the Buffalo harbor area. The hydraulic conductivity of the dredged material and the dikes along with the drainage characteristics of the disposal sites constituted the major focus of the hydraulic study. The engineering properties studied were the consolidation characteristics, bearing capacity, and slope stability of the placed fill. Slag dikes were found to be structurally sound and allowed rapid drainage. The fill material is spongy and not able to maintain slopes; it will not support buildings or roads unless piles are driven or extra underpinnings constructed first. The fill material does not drain well. A drainage network on the surface, with shallow channels sloping gently toward the dikes, would improve matters. (NOAA)

Descriptors: *Incineration, Organic wastes, Waste disposal, Organic compounds, Liquid wastes, Toxicity, Food chains, Industrial wastes, Ultimate disposal.
Identifiers: *Organochlorinated compounds.

Intensive industrial use of organochlorinated compounds produces large amounts of highly toxic wastes. Open sea burning may be an effective disposal method, avoiding pollution of the marine environment. While the direct toxicity of these products on each level of a trophodynamic marine food chain is very high, direct or induced toxicity of the vapor phase of the combustion along the same marine food chain was not evident.--Copyright 1975, Biological Abstracts, Inc.

MODERNIZING WATER FILTRATION PLANTS,
Riddle Engineering, Inc., Kansas City, Mo.
W. G. Riddle.
Public Works, Vol. 105, No. 6, p. 86-88, 108, June, 1974. 4 fig, 5 ref.

Descriptors: *Filtration, *Water purification, *Water treatment, *Filters, *Coagulation, Flocculation, Water quality control, Turbidity, Polyelectrolytes.
Identifiers: Turbidimeters.

Capacity of a well designed and maintained old water plant may be increased by modifying piping, basins, supporting elements, and upgrading the filter. The traditional 2 gallon per minute per square foot filtration rate can be multiplied several times, but high-rate filters must satisfy certain critical parameters. The modern 4 to 8 gallon per minute filter incorporates some but usually not all of the following: a dual bed involving two or more layers of graduated materials; wash rates of up to one and a half times traditional designs; air wash; strainer type filter bottom; secondary coagulant consisting of floc-strengthening polyelectrolyte; a pilot filter; and photoelectric turbidimeters to monitor raw water. Improved coagulation is necessary for high speed filtering so that today a comparatively violent flash mix, mechanical stirring in the flocculator basin, and improved instrumentation are called fro. The addition of 10 to 30 parts per billion of polyelectrolyte to the settled water above the filter strengthens the floc which allows it to penetrate deeper into the bed, resulting in a greater use of storage capacity. A pilot filter can detect deterioration of coagulation early so that normal conditions can be restored quickly. Similarly a pilot filter effluent turbidimeter permits adjustments to be made in primary coagulant feed rate and start up of the polymer feeder to the settled water at the filter effluent. Turbidimeters are efficient to operate, the only criticism being in calibration in ranges below .3 Jackson turbidity units. Backwash is an essential part of the system to permit trouble-free operation at high speed. (Smith-North Carolina)

PIONEERING IN WATER FILTRATION,
Whitman and Howard, Inc., Boston, Mass.
S. Medlar.
The American City, Vol. 90, No. 6, p 90-93, June 1975. 6 fig.

Descriptors: *Water supply, *Water treatment, *Filtration, *Water quality control, *Treatment facilities, *Activated carbon, Water pollution control, Water pollution treatment, Pesticide removal, *New Hampshire.
Identifiers: Manchester(NH), Double filtration process, Granular activated carbon(GAR), Lake Messabesic(NH), Merrimack River(NH).

Manchester, N.H. (population 88,000) constructed a $5.9 million treatment plant designed around a double filtration process which removes natural impurities and hazardous chemicals. The 40 million gallon a day facility will promote economic and residential expansion. Abandoning the polluted Lake Massabesic, Manchester will use the Merrimack River as its future source of water. The plant, able to treat either lake or river water, operates with a 5-step process: removal of particulate and dissolved impurities, flash mixing, flocculation and sedimentation, and double filtration with sand and deep-bed granular activated carbon (GAC) filters. This process results in elimination or reduction of color, taste, odor, turbidity, pesticides, volatile organics, phenols, herbicides, gasoline, iron, corrosiveness and toxic chemicals. Construction and operation costs are estimated at $1.40 a year per customer. Advantages of double filtration include increase in carbon adsorption and removal of oxidized iron, low particulate loading reducing backwashing to a minimum, tolerance of a softer granular carbon, ability to function under emergency conditions and savings in power. (Salzman - North Carolina)

Descriptors: *Model studies, *Water supply, Economics, Repairing, Equipment, Design criteria, Mathematical models, Networks, *Sewers.
Identifiers: *Poland.

Definitions and models of reliable and efficient water supply systems and their elements were discussed. Supplying data on the over-all and precise workings of technical objects from an economic viewpoint, the Central Bureau of Standards in Warsaw, Poland, furnished the indicators of reliability properties. According to the Bureau, all technical objects could be divided into reparable and irreparable categories. The definition of the former was an object which could be repaired for damages, and the definition of the latter was an object for which no repairs could be anticipated, even in the event of reversible damage. The category in which the object under discussion will be included is often decided by the user. In accordance with Soviet standards, reliability of an object is evaluated by the total number of such properties as suitability, durability, reparability,

resistance to storage, and preservation of inherent functional properties. The Central Bureau of Standards elaborated on these definitions. On their basis of the properties indicated, a number of mathematical equations were developed in order to calculate the probability of proper function of technical objects under various conditions. (Tallert-FIRL)

GOVERNMENT-CONTRACTOR-ENGINEER LIASON THAT CREATES AN ECONOMICAL PROJECT,
V. von Buchstab.
Engineering and Contract Record, Vol. 88, No. 13, p 40-42, Fall, 1975. 1 fig.

Descriptors: *Sewers, *Water treatment, *Treatment facilities, *Construction, *Economics, Engineering, Construction equipment, Governmental interrelations, Sewage treatment, Planning, Canada, Waste water treatment.
Identifiers: York Durham water and sewer project(Toronto).

The York-Durham water and sewer project in the Toronto region is under construction and will support 170,000 new homes and increased industrial development. The project is unusual because contractor-owner-engineer negotiations are being conducted and the contracting industry has been asked to contribute input to the final specs before official bidding. This liason between government, contractors, and engineers should help develop economic and viable construction methods. The contracting industry is in close contact with equipment suppliers and tends to be knowledgeable about improvements in technology. In addition, when bids are put out during slow business periods, they tend to be more carefully written. Additionally, the advent of a standardization policy has helped in coordinating discussion and planning recommendations. (Kramer-FIRL)

THE FUTURE OF WATER RESOURCES,
Wessex Water Authority, Bristol (England).
K. Jackson.
Chartered Municipal Engineer, Vol. 102, No. 11, p 216-218, November, 1975.

Descriptors: *Water sources, *Water supply, Water management(Applied), Administration, Rivers, Aquifers, Groundwater, Surface waters, Desalination, Recharge.

Because of the prediction that by the end of the century demand for public water supplies may double, the newly established Water Resources Board of England and Wales has had to consider long-term schemes for supplying water. At present, river abstraction and regulation of river flow provides most water supplies. In heavily populated areas such as London, water from a river outside the area, such as the River Severn, may have to be piped to the Thames to regulate the flow and increase the London water supply. One such scheme is already under way: a link between the rivers Tyne, Wear, and Tees will supply the Northumbrian Water Authority area with water until the end of the century. Another form of river regulation being developed involves pumping water from underground strata to augment the river flow. This plan is currently being developed to augment the River Thames. Artificial recharge is a solution that involves feeding surface water into underground strata to improve the yield of boreholes sunk into the aquifer. This system utilizes natural storage as opposed to costly manmade storage. The idea of developing estuary storage by the construction of barrages is thought to be prohibitively expensive. Desalination is also too expensive to warrant use in England. Low-quality water supplies could be piped to industries and good quality sources could be reserved for drinking water. Combinations of these solutions could provide sources in excess of the sum of the separate yields if each source is operated in isolation. (Loustau-FIRL)

Descriptors: *Potable water, *Treatment, *Water treatment, *Waste water treatment, *Indexing, Bibliographies, Publications, Information exchange, Costs.
Identifiers: KWIK Index.

Information is presented on treatment processes for potable water supplies and their costs. Volume II consists of a KWIK Index which provides additional references for more detailed information on treatments and costs. The purpose of the report is to be a general planning document to give the user general concepts on what treatment methods are available to remove specific contaminants or reduce them below the limits required or recommended by the 1974 Federal Drinking Water Standards and Guidelines. Physical, biological, chemical and radiological contaminants are covered. Cost estimate curves and procedures are outlined in Volume I. The KWIK Index in Volume II is divided into reference, subject and author sections. The reference section is organized numerically. The subject section lists subjects, titles and reference numbers which allow cross-referencing to the reference section. The author section lists principal authors and also refers to the reference section. (Pinto-FIRL)

AUTOMATIC WATER DISTILLER,
C. C. Dennison.
U.S. Patent No. 3,935,077, 5 p, 4 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 942, No 4, p 1867, January 27, 1976.

Descriptors: *Patents, *Water purification, *Water treatment, *Water quality control, *Water pollution treatment, *Water pollution control, *Distillation, Condensation, Evaporation, Domestic water, Condensors, Evaporators.

The automatic water distillation apparatus described is primarily designed for domestic use although it can be employed for commercial use. The system uses both air and water to cause condensation of the steam produced by an electrical evaporator. By utilizing water to cool the steam prior to supplying it to the evaporator, the amount of energy required by the evaporator to convert water to steam is reduced. The water distillation apparatus includes a base having a removable shell. An insulated evaporator is enclosed within the shell and the base. A condensing chamber within the shell above the insulated evaporator has steam transported from the insulated evaporator. A water cooling and preheating chamber is above the condensing chamber with the water cooling and preheating chamber having a common wall with the condensing chamber to provide heat exchange. Water is supplied to the water cooling and preheating chamber to aid in cooling the steam in the condensing chamber. The condensing chamber has its outer wall spaced from the shell to form a passage and the flow of air through the passage aids in cooling the steam in the condensing chamber. Distilled water produced by condensation of the steam in the condensing chamber is collected by suitable means. (Sinha - OEIS)

CLARIFICATION PROCESS,
Georgia-Pacific Corp., Portland,Oreg. (Assignee).
W. S. Briggs.
U.S. Patent No. 3,935,101, 11 p, 1 tab, 3 ref; Official Gazette of the United States Patent Office, Vol 942, No 4, p 1873, January 27, 1976.

Descriptors: *Patents, *Water treatment, Water quality control, Water pollution control, *Water pollution treatment, *Flocculation, Coagulation, Lignins, Settling basins, Suspended solids, Colloids, Chemical reactions, Separation techniques, Pulp wastes.
Identifiers: Lignosulfonates, Di-epoxides.

A clarification process for flocculation of solids suspended in an aqueous medium uses improved flocculating agents prepared from lignin and lignosulfonates. A water-soluble lignindi-epoxide reaction product is obtained by reacting a lignin with a long chain, terminal di-epoxide having a molecular weight in the range of from 120 to 18 to the extent that the phenolic hydroxyl content of the lignin has been reduced from about 40% to 95%. By reacting the lignin with a limited amount of epoxide under controlled conditions, cross-linking or bridging of the lignin by long chains is obtained resulting in formation of molecules having large entities held together at a distance from each other by non-rigid, flexible bonding. The products when dissolved in aqueous medium form loosely bound, flexible molecules having increased area for adsorption or entrapment of fine solid or colloidal particles in the solution or suspension to result in the flocculation of the particles. It is essential that the reaction be carried out under controlled alkaline conditions to prevent the lignin from reacting with the di-epoxide to the extent that the reaction product becomes water soluble. Journal of the American Society of Civil Engineers, Hydraulics Division, Vol. 101, No. Hy3, p. 495-509, 1974. 2 fig., 1 tab., 17 ref.

Descriptors: *Water quality standards, *Water quality control, *Interstate, *Delaware River Basin Commission, Comprehensive planning, Regulation, Administration, Self-purification, Low-flow augmentation, Encroachment, Saline water, Sewage districts, Estuaries.
Identifiers: Regional sewage facilities, Regional waste treatment.

An example of interstate regional water quality control is given by citing the scope and functions of the Comprehensive Plan of the Delaware River Basin Compact adopted by the Delaware River Basin Commission. The Plan includes policies, standards, criteria, and general goals, as well as physical projects and facilities deemed necessary by the Commission for water resources conservation, development, and management in the 13,000 sq mile four-state region. It is in effect a code of administrative laws and has the force of law. The use of the Basin's waters for controlled and regulated assimilation of treated wastes is recognized as a beneficial water use protected by the Comprehensive Plan. It includes provision of storage capacity for pollution abatement, for waste assimilation, and for control of seawater intrusion. The Commission has sponsored or participated in regional sewage treatment efforts and has established regional standards for DO levels. Compliance with the Basin's water quality plan is being effected by (1) consultative planning between the Commission and sponsors of water-related projects; and (2) formal detailed review of water-related projects before construction approval is granted. FORMULATION AND USE OF PRACTICAL MODELS FOR RIVER QUALITY ASSESSMENT,
Geological Survey, Portland, Oreg. Water Resources Div.
V. G. Hines, D. A. Rickert, S. W. McKenzie, and P. P. Bennett.

Descriptors: *Performance, *Model study, River, **Water quality, Planning, Management, Mathematical models, Data collection, *Oregon.
Identifiers: *Willamette River(Ore).

Considerations vital to formulation and use of practical river quality models applicable to planning and decision making are described. Deficiencies in modeling rationale are discussed and suggestions made for improvement in order to provide a basis for examining potential shortcomings of proposed models. Mathematical model can be used for river basin planning and management if premises and limitations are recognized, the model properly formulated, calibrated, and verified. Environmental factors and processes affecting river quality must be scientifically appraised. Successful appraisal depends on the complexity of physical conditions in each river basin and available knowledge. Analysis of river hydrology (runoff, water temperture pattern, channel morphology) is essentially applied river quality model formulation. River hydrology is the most important single factor governing time and space variability in river quality behavior; it helps identify critical time period and reaches of the river for which a model may be effectively applied. Calibration and verification of models should be based on separate, statistically reliable data for variables and processes being modeled. To be valuable, model production runs must be understandable to users. The Willamette River, Oregon, data collection program is used to show the kinds of data required for river quality models. WATER HYACINTHS FOR REMOVAL OF PHENOLS FROM POLLUTED WATERS,
National Space Technology Labs. Bay St. Louis, Miss.
B. C. Wolverton.
Available from the National Technical Information Service, Springfield, Va 22161, as N75-16128, $3.50 in paper copy, $2.25 in microfiche. NASA Report No. TM-X-72722, February 1975. 18 p. 3 fig., 3 tab., 30 ref.

Descriptors: *Absorption, *Water hyacinth, *Phenols, *Water pollution control, *Mississippi, Aquatic plants, Metabolism, Chemical wastes, Water pollution treatment.
Identifiers: Bay St. Louis(Miss).

Although water hyacinth (Eichhornia crassipes) is a serious aquatic weed problem in warm climates, it is a promising candidate for solving food supply, energy requirements, and water pollution problems. It is being investigated at the NASA National Space Technology Laboratories, Bay St. Louis, Mississippi, as a pollution abatement tool for removal of photographic and chemical laboratory wastes. The results of the study on the ability of water hyacinth to remove phenols from waters are described. Individual four-week and older plants were exposed to phenol in distilled water containing liquid plant food, East Pearl River water, or water from a Louisiana bayou. Recovery experiments indicated that water hyacinths removed phenol and rapidly metabolized it to other components. Translocation studies using C14 are in progress. Water hyacinths removed 36 mg phenol from distilled, river, and bayou water/g dry plant weight in 72 hours. One hectare containing approximately 1,620,000 plants could conceivably remove 160 kg phenol in 72 hours. A water filtering lagoon system is being built to test the use of water hyacinth and other vascular plants for pollution abatement. Hyacinth mats will be started in lagoons at various times as uptake is greater by plants in a rapid growth phase at pH 6.9-7.0. (Buchanan-Davidson--Wisconsin)

THE ROLE OF POLLUTEE TAXES IN EXTERNALITY PROBLEMS,
Boston Coll., Chestnut Hill, Mass.
M. Kraus, and H. Mohring.
Economica, Vol. 42, No. 166, p. 171-176, 1975. 1 fig., 4 ref.

Descriptors: *Pollution taxes(Charges), Third party effects, Resource allocation, Equity, Indirect costs, Indirect benefits.

A serious problem exists in incorporating technological externalities in pollution taxes where de facto externalities involve multiple local optima and both complex and changing interrelations, due to the impossibly costly information requirements necessary to design a pricing system for externalities that would enable moving in one step from an existing, nonoptimum allocation of resources to a globally optimum allocation. The rationalizations for taxing pollutees (those damaged by technological externalities) as well as polluters by recursive taxing schemes are considered attractive only because of their small information requirements. The arguments posed by Coase (1960, p. 42), Baumol (1972), and Mohrin and Boyd (1971) for site relocation of pollutees or taxes on pollutees to account for the marginal pollution costs incurred by the pollutor due to the pollutees' locational decisions into the pollutor's environs, are assessed. The conclusions are that in a world of multiple local optima, neither sequentially adjusted polluter taxes alone nor such taxes coupled with sequentially adjusted site taxes on pollutees would be relied on to achieve a global optimum. And, there appears to be no inexpensive mechanism for obtaining global optimality in externality problems involving multiple local optima. (Auen-Wisconsin)

THE POLITICAL ECONOMY OF EFFLUENT CHARGES,
Pennsylvania State Univ., University Park. Center for the Study of Environmental Policy.
T. A. Ferrar, and P. Sassone.
Working Paper No. 5, May 1974. 16 p. 2 fig., 14 ref.

Descriptors: *Pollution taxes(Charges), *Political aspects, *Equity, Industries, Effluents, Theoretical analysis.

It is posited that any environmental policy must pass certain political acceptability tests before it may be implemented and that political constraints effectively prohibit the construction of an optimal effluent charge. Two conditions are introduced that an effluent charge scheme would likely be required to satisfy and it is demonstrated that, in general, no optimal effluent charge that satisfies these conditions is available. (1) The traditionally accepted principle is that 'equals must be treated equally', i.e., any two firms producing the same effluent should face the same effluent rate structure. Under this principle it is mathematically demonstrated that the equity requirement is a severe restriction on the efficiency of effluent charges. (2) Alternatively, if it is required that each firm be held strictly self-accountable on its effluent behavior, under the self-accountability condition effluent charges also cannot yield socially optimal resource allocation if the cost function does not exhibit these conditions. It is pointed out that if this strict accountability condition is essential for operational policy, then only under this restrictive technological condition could an optimal effluent charge policy be established. It is not proposed that no effluent charge policy should be implemented but rather the question posed is whether a specific policy is an improvement over available policy alternatives. (Auen-Wisconsin).

WATER CONTENT AND BULK DENSITY CHANGES IN A SOIL PEDON MEASURED WITH DUAL ENERGY GAMMA-RAY TRANSMISSION,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
R. J. Reginato.
Can J Soil Sci. 54(3): 325-328. Illus. 1974.

Descriptors: *Soil density, *Soil water, *Measurement, *Water measurement, *Instrumentation, Soil profiles, *Soil density probes.
Identifiers: *Gamma-ray transmission technique, *Pedon.

Water contents and bulk densities were measured in a soil pedon with a gamma-ray transmission technique utilizing 137Cs and 241Am. By alternating the sources for each scan down the soil profile, both bulk density and water content were determined in 1-cm increments in the top 10 cm of the pedon. Bulk density decreased to a depth of 6 cm about 30 min after 4 cm of water was ponded on the soil surface. As soon as the water drained from the surface, bulk density values increased and approached pre-irrigation levels. Water content increased rapidly corresponding to the decrease in bulk density. Assuming that the bulk density remains constant during ponding, calculated water contents may be in eror by as much as 0.25 gcm-3.--Copyright 1975, Biological Abstracts, Inc.

DEVELOPMENT OF AN ECONOMIC/ENVIRONMENTAL PLAN FOR DENTS RUN WATERSHED, WEST VIRGINIA.
Halliburton Services, Duncan, Okla.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-242 671 $4.50 in paper copy, $2.25 in microfiche. Final report. Prepared for the Appalachian Regional Commission, Washington, D.C. March 1973. 75 p, 11 fig, 2 tab, 4 ref. EPA 14010-HQC-2.

Descriptors: *Pollution abatement, *Watershed management, *Solid wastes, Environmental sanitation, *Environmental control, *Coal mine wastes, *Sewage disposal, *Costs, Air pollution, Water pollution control, *West Virginia.
Identifiers: Dents Run(WV), *Dents Run watershed(WV), Cost estimates, Junked cars.

This watershed of 14.6 sq mi contains two cities, Granville (population 1050) and Westover (population 5089). The very polluted flow of Dents Run consists of water from coal mining operations or abandoned mines, except during the rainy season. A survey to discover pollution sources revealed four main sources: sewage discharge into the Monongahela River and Dents Run, trash and garbage, junk cars, and coal mine fires. Plans for and costs of correcting environmental problems are discussed. Short range plans last up to six months and are mainly educational while long range plans require more initiation time, new laws or additional funding. Sewage disposal is the major problem. Aside from educational efforts, this will require the building of septic tanks at owner's expense at rural home locations, and a sewage treatment plant for urban locations. Four plans are given, each at a different capital and operating cost. Solid waste collection could be handled by towns individually or through a public service district. The recommended plan encompasses the entire county. This serves the most people at the lowest cost per person. Costs for removing junked car bodies are expected to exceed the value of the cars, so that government or private help is needed to locate cars, determine ownership, acquire the rights and haul to a shredder. The last problem surveyed was that of extinguishing burning coal outcrops. Coal mine operators may extinguish the fires as a 'good neighbor policy'. Otherwise it must be done at public expense. Cost estimates for work, sources of funds, and authorities involved are presented. (Smith - North Carolina)

AN APPROACH TO A WATER QUALITY INDEX FOR CANADA,
Department of the Environment, Ottawa (Ontario). Science Policy Branch.
H. Inhaber.
Water Research, Vol. 9, p. 821-833, September 1975. 14 fig, 5 tab, 7 ref.

Descriptors: *Water quality, Pollutants, *Standards, *River basins, *Industrial wastes, *Municipal wastes, Water pollution, Water supply, Recreation, Water quality standards, Mercury, Data, Metals, *Canada.
Identifiers: *Water Quality Index (WQI), Industrial and Municipal Effluent Index, Ambient Water Quality Index.

A Water Quality Index (WQI) (part of an Environmental Quality Index) is conceptually similar to economic indices such as Gross National Product though more difficult to obtain because of problems of nonuniform and qualitative data. To construct an index data must be available on a national scale. Here each of several subareas was treated to cover a range of pollutants. They were designed to reflect the magnitude of polluted effluent, the effect of pollution abatement, and some secondary effects such as contamination of water supplies and fisheries. Subindices obtained are combined mathematically through the root-mean square method which accentuates values farther from the mean. Group 1 is the Industrial and Municipal Effluent Index which covers municipalities and 4 major Canadian industries (petroleum refining, pulp and paper, fish processing, and chlor-alkali). To include different wastes in a combined index the constituents were rated relative to one another on the basis of the estimated importance of their effect on 3 water uses, suitability for drinking, fish and aquatic life, and recreation. A most stringent criterion was used to state the minimum concentration of a waste at which any of the water uses would be impaired. Group 2 is the Ambient Water Quality index which deals with trace metal contamination of water supplies, river quality in terms of turbidity, and mercury contamination of fish landed commercially. The indices are combined mathematically. Because of lack of data, it has not yet been possible to compile an overall quality index for specific rivers or basins. (Smith - North Carolina)

USING WASTEWATER SOLIDS TO RECLAIM STRIP-MINED LAND,
Metropolitan Sanitary District of Greater Chicago, Ill.
H. McMillan, and R. Carlson.
Transactions of the Society of Mining Engineers, Vol. 258, No. 4, p 273-278, December, 1975. 4 fig, 5 tab, 5 ref.

Descriptors: *Land reclamation, *Waste water treatment, *Strip mines, Waste disposal, Sludge disposal, Acid mine water, Liquid wastes, Crops.
Identifiers: Land application, Chicago(Ill).

To cope with 700 dry tons of waste water solids produced each day, the Sanitary District of Chicago chose land application, and conducted tests before initiating a strip-mined land reclamation program. One demonstration project undertaken by the Sanitary District showed that annual yields of corn were consistently higher with sludge application than without it. Another demonstration involved reclamation of acid strip-mined land. Applications of liquid sludge supported cover crops while the control with no sludge did not. Samples of drainage water from the mine showed that the vegetation growth retarded the rate of acid production. The pH of the surface soi after liquid application was high enough to keep the metals from going into solution. A so phisticated research project was conducted at the University of Illinois. Drainage water from plots of various soils treated with liquid waste wa analyzed. After passage through a natural sand filter, drainage water consistently contained les than the standard limit for nitrate. Addition fiel experiments with corn and soybeans showed tha the liquid fertilizer was an effective source o nitrogen and phosphorus for crops. Encouraged b the results of the University tests and its ow demonstration program, the Sanitary Distric purchased 10,000 acres of land that had been strip mined for coal. The Sanitary District plans t apply 75 dry tons of sludge per acre the first yea 60 tons the second year, 45 tons the third year, an 30 ton the fourth year, at which point the progra will be reevaluated. THE WATERSHED APPROACH TO UN DERSTANDING OUR ENVIRONMENT,
Agricultural Research Service, Fort Collins, Colo
D. A. Woolhiser.
Journal of Environmental Quality, Vol. 4, No. 1, 17-21, January/March, 1975. 2 fig, 25 ref.

Descriptors: *Model studies, Watersheds(Basins Water management(Applied), Mathematic models, Runoff, Decision making, *Agricultur watersheds.

Current approaches used in modeling the agricu tural watershed include the formal, mathematic model and the material, representational mod Formal models allow predictive statements to made; material models provide interpretation three-dimensional flow in a porous medium w surface runoff, but are simpler to work with th the real system. Formal models consisting of s of partial differential equations can be simplifi by reducing their dimensionality to one space, treating groundwater flow as a steady-st problem, and by using 'lumped' or compartm models to eliminate spatial variability. N homogeneities or spatial variability can be cluded in a material model. The model would fi include spatial variability and then would modified so that such variability would averaged in some sense. Models are used in decision-making process; therefore, they must clude only the most important of subprocesses volved or they will become unduly cumberso When a model is developed for one purpose cannot be used for another application. A FRAMEWORK FOR EVALUATING INSTI TIONAL AND SOCIO-ECONOMIC ISSUES LAND TREATMENT OF WASTE WATER,
Economic Research Service, Upper Darby, Natural Resource Economics Div.
L. A. Christensen.

ournal of Environmental Quality, Vol. 4, No. 2, p 45-153, April/June, 1975. 1 fig, 1 tab, 27 ref.

Descriptors: *Waste water disposal, *Nutrient emoval, *Regional planning, Land management, Land development, Management.
dentifiers: Land application, Socioeconomic lanning.

Land treatment involves the application of waste vater to vegetation producing land for adsorption f nitrates and phosphates by soil and plants. To ncourage a multidisciplinary approach to land reatment planning, some institutional and socio-conomic issues are highlighted here through a iscussion of alternative means of acquiring and anaging land treatment sites. If a public agency urchases the land by fee simple acquisition, anagement can be handled by subcontracting for ustom farm operations, or the land can be leased o farmers. The land can also be resold for private se with some legitimate conditions. Easement urchase, or partial property rights purchase, is nother alternative which has the advantage that anagement is left in the hands of the private wner. A new approach to land access is municipal nd private cooperative ownership with division of anagement costs. Some examples are given of xisting systems and their management. (Loustau-IRL)

ATER QUALITY MANAGEMENT FOR ETROPOLITAN KANSAS CITY,
lack and Veatch, Kansas City, Mo.
. J. Schmidt.
ournal of the Environmental Engineering Divi-on, Proceedings of ASCE, Vol. 101, No. EE6, p 5-946, December, 1975. 5 fig, 3 ref.

escriptors: *Water quality control, *Sewerage, Planning, *Kansas, Missouri, Municipal wastes, unicipal water, Waste water treatment, State ju-sdiction.
entifiers: *Kansas City(Mo).

ack of centralized sewerage planning for etropolitan areas has resulted in problems of in-lequate facilities, untrained operators, and ex-nsive duplication costs. This study of the etropolitan Kansas City water treatment systems ints to the new and much-needed trend toward ified water treatment planning and management r metropolitan areas. The specific problems en-untered in the Kansas City metropolitan area ere watersheds crossing state lines and differing licies of the two states for treatment. Seven op-ns for managing the eight counties on both sides the Kansas-Missouri line were developed by ack and Veatch, Consulting Engineers. These tions include organizing a water management ency for the entire metropolitan area, organizing encies along county lines, and organizing agen-s along watershed districts. Because interstate operation might still be difficult to achieve, a mbination county-watershed system of agencies s thought to be the most appropriate. Although islation already exists allowing interstate nagement, more legislation may be needed to engthen this power. Whatever design is chosen, s recommended that the number of management encies be reduced to as few as possible and that operation in planning and operating be en-uraged. (Loustau-FIRL)

ALING WITH THE DISCHARGE MONITOR-G REPORT,
n Antonio Wastewater Treatment Plant, Tex.
. Holm.
ter and Sewage Works, Vol. 122, No. 12, p 62-December, 1975. 4 fig.

scriptors: *Monitoring, *Legislation, *Waste ter treatment, *Treatment facilities, Biochemi-oxygen demand, Suspended solids, Water lity control, Effluents, Texas.

Identifiers: Effluent discharges, San Antonio(Tex).

Some problems of the discharge monitoring report, EPA Form 3320-1 (10-72), were solved by the San Antonio Waste Water Treatment Plant. A work sheet, a smaller, more concise version of the EPA Form, was prepared on 8-1/2 by 11 inch paper. Examples of the large form and the work sheet are reproduced in the article. A form letter, also reproduced in the article, was then prepared for weekly reports. Details of reporting and recording are given. For plants which have not yet made the calculations for the biochemical oxygen demand and the total suspended solids loadings, the computation is as follows: the effluent quantity in mgd is multiplied by the parameter effluent concentration in mg/liters; that product is then multiplied by a conversion factor of 3.785 to obtain the loading in kg/day. The conversion factor results from multiplying 8.345 pounds per gallon by 0.4536 kilograms per pound. (Loustau-FIRL)

HOW THE GREAT LAKES WERE EVALUATED,
Great Lakes Basin Commission, Ann Arbor, Mich.
W. C. Sonzogni.
Environmental Science and Technology, Vol. 9, No. 10, p 929-928, October, 1975. 1 tab.

Descriptors: *Great Lakes region, Water management(Applied), Planning, Data collections, Government supports, Legislation, Environmental effects, Evaluation.

The Great Lakes Basin Framework Study produced 6,000 pages of report and appendices to provide a broad-scale analysis of resource needs and problems in the U. S. portion of the Basin. This article gives a brief description of the report and its 23 appendices (divided into six general categories). The first part concerns alternative frameworks. The second set of appendices give basic resource information. Water resources use and management is the topic of the third category. Land resources use and management is the fourth category. The fifth discusses economic, social, and institutional studies, laws, and policies, and the sixth discusses environmental quality. The main report is a general summary of the appendices. In addition, an Environmental Impact statement and a special critique of the Framework Study were prepared. The statement summarizes the impacts and possible adverse effects of the Framework Study's plans. A group of governmental agencies and public interest groups critically examined the issues and questions which arose from the Framework Study. The report provides information for scientists, engineers, planners, and conservationists. (Loustau-FIRL)

MANAGEMENT OF AN EFFECTIVE MAINTENANCE PROGRAM,
California State Univ., Sacramento. Dept. of Civil Engineering.
K. D. Kerri, and J. Brady.
Water and Sewage Works, Vol. 122, No. 11, p 56, November, 1975.

Descriptors: *Waste water treatment, *Operation, *Maintenance, *Storm runoff, Treatment facilities, Inflow, Infiltration, Water management(Applied), Administration.

Improper operation and maintenance of waste water collection systems can create many problems. Untreated waste water flowing down streets and water courses during stoppages and storms can cause health hazards. Lack of proper installation, preventive maintenance, surveillance, and repair programs can result in system failures. The collection system, lift stations, and treatment plants can produce odors. Shock loads that upset treatment processes can occur. Equipment and structures can become corroded. Use of a valuable portion of the capacity of the facilities can be taken up by inflow and infiltration. Problems from system failures can result in complaints from the public or from local officials. To effectively operate and maintain a waste water treatment plant, managers must establish a good set of procedures for planning and recording the activities of the maintenance program. Managers must also train their maintenance forces to apply these programs. (Loustau-FIRL)

HOW TO IMPROVE PLANT EFFICIENCY,
Environmental Protection Agency, Washington, D.C. Office of Water Programs Operations.
W. G. Gilbert.
Water and Sewage Works, Vol. 122, No. 11, p 58, November, 1975.

Descriptors: *Waste water treatment, *Treatment facilities, *Municipal wastes, *Monitoring, Government finance, Water quality standards, Legislation, Performance, Water pollution control.

A compilation of reports from surveys conducted over three years revealed that about one-third of the nation's municipal treatment facilities constructed with Federal grant assistance are not operating at their designed efficiency levels. To improve the efficiency and reliability of treatment facility performance, local, state and Federal programs must establish tighter control and monitoring. Operators must be well trained and certified. Violations of permit limitations must be pursued aggressively and corrected. Operational expertise must be applied to the planning and design levels. Plant performances must be monitored and evaluated. New and simplified laboratory procedures must be tested. Adequate operating budgets at the local level must be provided. Proper operation and maintenance of existing plants is essential for reaching and maintaining effluent quality standards. (Loustau-FIRL)

DETERGENT PHOSPHATE BAN YIELDS LITTLE PHOSPHORUS REDUCTION, PART II,
Purdue Univ., Lafayette, Ind. Dept. of Environmental Engineering.
J. E. Etzel, J. M. Bell, E. G. Lindermann, and C. J. Lancelot.
Water and Sewage Works, Vol. 122, No. 10, p 91-93, October, 1975. 8 fig, 6 tab.

Descriptors: *Legislation, *Detergents, *Phosphates, *Phosphorus, Waste disposal, Eutrophication, Bioassay, *Indiana, Rivers, Nutrient removal, Sewage disposal, Sewage treatment.

The legislative ban in Indiana on detergent phosphates has failed to reduce the remaining stream phosphorus to levels low enough to be of any biological significance in reducing the potential for algal growth. Results of a 1974 study show that despite the existence of the statewide ban for 1.5 years, mean total-P concentrations are 110 to over 2000 ppb throughout the studied rivers. This

is considerably higher than the 10 to 50 ppb generally considered to be the range in which phosphorus can limit excessive algal growth. Laboratory bioassays all failed to show a positive growth response to phosphorus spiking. No correlation was found between total phosphorus levels and observed fertilities in the studied rivers. Data for specific sections of rivers studied are given in tables. It has been found, however, that nutrients can be reduced from sewage treatment plant discharge through flocculation. (See also W76-03235 and W76-06346) (Loustau-FIRL)
W76-06345

DETERGENT PHOSPHATE BAN YIELDS LITTLE PHOSPHORUS REDUCTION, PART III,
Purdue Univ., Lafayette, Ind. Dept. of Environmental Engineering.
J. E. Etzel, J. M. Bell, E. G. Lindemann, and C. J. Lancelot.
Water and Sewage Works, Vol. 122, No. 11, p 68-70, November, 1975. 1 fig, 2 tab, 11 ref.

Descriptors: *Water quality control, *Legislation, *Phosphates, *Detergents, *Indiana, Biological treatment, Sewage treatment, Water pollution effects, Chemical precipitation, Flocculation.
Identifiers: Legislative bans.

The legislative ban on detergent phosphates in Indiana has failed to reduce the remaining stream phosphorus to levels low enough to be of any biological significance. The results of the 1974 study that reveal the failure are detailed in tables and a graph. Whether or not the actual phosphorus concentration has been decreased is debateable but not the real issue. What is significant is that the ban limitations are still too high to limit algal growth. In addition, the ban on detergent phosphates may have confused the public of the overall objective. The idea that chemical precipitation is solely a phosphorus removal step is a misunderstanding. Chemical precipitation greatly increases the removal of all nutrients, including residual BOD, from treated sewage. The elimination of detergent phosphates alone has not upgraded the quality of treated water. Other phosphorus reductions must also be made, and chemical flocculation steps are needed in all treatment systems if the State's water quality standards are to be met. SEWER/WATER PREFERRED LONG RANGE PLANS.
Northern Middlesex Area Commission, Lowell, Mass.
January 1972. 62 p, 5 fig, 4 tab, 5 append.

Descriptors: *Sewers, *Sewage districts, *Comprehensive planning, *Water distribution(Applied), *Water management(Applied), Sewage treatment, Water districts, Costs, Water demand, Utilities, *Massachusetts, Treatment facilities.
Identifiers: Northern Middlesex Area(MA), Billerica(MA), Chelmsford(MA), Dracut(MA), Dunstable(MA), Lowell(MA), Pepperell(MA), Tewksbury(MA), Tyngsborough(MA), Westford(MA), Merrimack River(MA).

The proposed sewer and water plan for Northern Middlesex Area is intended to serve as a basis for coordinating local efforts, as a framework for review of proposed projects, and as a major tool in the implementation of the future land use plan. As general utility policies, the following recommendations are made: (1) Major responsibility for administration of utilities should remain at the local level.A regional mechanism could reduce local costs by facilitating such activities as central purchasing, sharing of special equipment, and sharing of trained personnel. (2) Utility planning at the local level should be assisted by a continuous process of comprehensive planning. (3) Locations of future industries should be influenced by planning and zoning to minimize utility costs. (4) An advisory committee of experts, local citizens and officials should assist in planning and coordinating agreements between and among utility districts. Three subregional sewerage systems are recommended: Lowell-Tweksbury-Dracut, Billerica, and Chelmsford-Westford-Tyngsborough-Pepperell. On site disposal is appropriate for Dunstable. Joint commissions are to administer these regional systems and determine a fair accounting method for sharing cost savings. Water systems must be concerned with sharing sources of supply, future development of larger combinations of existing water supply systems, and inter-system connections and coordination. Beyond 1975 the zoned capacity of the Lowell water treatment plant will have to be expanded to meet demand. This need could be met by a regional water treatment plant or by a Northern Middles ex Water District built around facilitis on the Merrimack River.(See also W76-06353) (Henley-North Carolina)

SEWER AND WATER FACILITIES IN THE NORTHERN MIDDLESEX AREA, SHORT RANGE PRIORITY PROGRAM 1972-1977.
Northern Middlesex Area Commission, Lowell, Mass.
June 1972. 36 p, 3 tab, 1 map, 3 append.

Descriptors: *Sewers, *Water supply, *Water demand, *Water distribution(Applied), *Effluents, Pollution, Sewage treatment, Water quality, Water management, Planning, *Treatment facilities, *Massachusetts.
Identifiers: Northern Middlesex Area(MA), Merrimack River(MA).

This program has been developed to meet HUD's and EPA's requirements for establishing priorities for development of sewer and water facilities in order to maintain eligibility for capital grants. Its first concern is to provide a coordinated regional framework for the development of necessary waste treatment facilities directed at eliminating the dumping of untreated sewage into waterways. The Massachusetts Division of Water Pollution Control has issued schedules for the correction of raw sewage discharge to the communities of Lowell, Dracut, Chelmsford, Pepperell and Billerica. These areas then receive priority in the development of sewerage systems. The second priority level is concerned with eliminating possible health hazard areas and/or servicing areas of dense residential or commercial development. Knowledge of the complex factors which influence the water environment is far from complete. Deficiencies, gaps, and conflicts in the program are recognized. Federal, state and local governments and regional planning bodies are expected to participate in implementing the sewerage program. The second major concern is with the development of a short range (5 years) priority water systems program. Ground water supplies are becoming increasingly insufficient and unsafe. More communities are turning to the Merrimack River for their water supply. Possible economies of scale are promoting community cooperation in capital investment programs for expanding treatment facilities. In order to meet the first priority of meeting the demand for water in areas suffering from continual or seasonal water shortage, capacity of the Lowell treatment plant should be increased by a least 100%. (See also W76-06352) (Henley - North Carolina).

MINE SPOIL RECLAMATION RESEARCH AT THE BELLE AYR MINE, NORTHEAST WYOMING,
Forest Service (USDA), Fort Collins. Colo. Rocky Mountain Forest and Range Experiment Station.
H. K. Orr.
In: Proceedings Fort Union Coal Field Symposium, April 1975, Billings, Montana, Montana Academy of Science, Billings, Vol. 3 p 304-307. 1 tab, 2 ref.

Descriptors: *Coal mine wastes, *Vegetation establishment, Mine hydrology, Overburden, Spoil banks, *Wyoming, Watershed management.
Identifiers: *Mine spoil reclamation, Surface coal mining, Vegetation reestablishment.

Surface mining of coal drastically alters plant-soil-water relationships. Gross effects are of concern to managers as well as means of minimizing undesirable impacts. Ground water impact are of special concern in the semiarid environment of the western Great Plains. Revegetation is a primary step in reclamation for control of surface runoff, erosion, sedimentation, and for aesthetics. Initial trials with shrubs and trees have been only moderately successful. Lack of moisture is a primary limiting factor. Reclamation requirements justify the design of additional cultural treatments to insure success of revegetation. (Forest Service)

Descriptors: *Land reclamation, Overburde *Wyoming, *Strip mines, Soil chemical prope ties, Soil physical properties, *Fertilit *Vegetation establishment, *Soil moisture.
Identifiers: Spoil salinity, AMAX coal min Campbell County(Wyo), Fort Union Formatio Wasatch Formation, Coal spoil reclamation.

The geologic materials overlying coal beds--call spoils after the coal has been removed--ha unique physical and chemical properties. They a not 'soil' in a pedologic sense, nor are they geol ically the same as the rock formations from whi they were derived. Their unique properties son times pose problems in revegetation attempts. A first step in understanding spoils, samples fr the AMAX Coal Company in Campbell Coun Wyoming were analyzed by standard agricultu soils analysis procedures. The spoils were ov burden from the Roland and Smith coal beds of Fort Union Formation. Coal from this format represents the greatest strippable deposit Wyoming. Although slightly more saline than surrounding natural soils, the spoil salinity is enough to severely limit plant growth or survi The general nutrient status of the spoils is low ideal plant growth, but the generally loamy text is favorable. Furthermore, the homogeneity physical properties and dressed spoil depth p vide a moisture reservoir capacity consistent w capacities of natural soils. Thus, favora response is anticipated from the AMAX sp material as a growing medium. (Forest Service)

Identifiers: *Zagyva River basin(Hungary).

A long-term research program of the Institute of Water Management and Hydraulic Engineering at the Technical University in Budapest has been concerned with water quality control in river basins. A goal has been the introduction of water quality system tests into teaching, research work, and engineering practice. On the basis of published experience, mathematical models and computer programs have been developed for water quality system tests, including hydrology and water quality predictions, mathematical simulation of self-purification, water quality variation, and optimum development of water quality control systems. The developed models and programs have been tried in water quality system tests of the Zagyva River, which has its source and most of its catchment area in Hungary. Advantageous was the proposed construction of an automatic water management control system in the Zagyva basin, automatically recording a great many data to facilitate water quality system tests, and thus the development of a water quality control system. WATER QUALITY PLANNING STRATEGY,
Camp, Dresser and McKee, Inc., Boston, Mass.
G. R. Grantham, and T. E. Bailey.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. WR1, Proceedings paper No. 12060, p 11-22, April 1976. 8 fig, 11 ref.

Descriptors: *Water management(Applied), *California, *Control, *Coordination, *Planning, *Water quality, Water resources, Legislation, State governments.

The California State Water Resources Control Board created the Office of Technical Coordination (OTC) to coordinate and oversee the administrative and technical effort required for the formulation of a planning program to preserve and enhance the quality of the State's water resources. The project included the development of water quality planning for each of the 16 hydrologic basins. Begun in 1970, the program complies with Federal requirements initially established in 1970 and new requirements imposed in 1972 by PL 92-500 and with the State's Porter-Cologne Act. Both laws require the preparation of water quality control plans for the State's 16 basins. With the enactment of these laws, significant changes were required in current water resources management method and practices. The fundamental changes with the greatest impact were in the areas of multiagency coordination, use of multidisciplinary planning procedures, and implementation of a comprehensive step-wise planning strategy. HYDROLOGIC EVALUATION OF SALINITY CONTROL AND RECLAMATION PROJECTS IN THE INDUS PLAIN, PAKISTAN--A SUMMARY,
Geological Survey, Reston, Va.
M. J. Mundorff, P. H. Carrigan, Jr., T. D. Steele, and A. D. Randall.
Available from Superintendent of Documents, Government Printing Office, Washington, D.C. 20402, $2.95 in paper copy. Water-Supply Paper 1608-Q, 1976. 59 p, 4 fig, 2 plates, 9 tab, 43 ref.

Descriptors: *Water quality control, *Salinity, *Surface waters, *Groundwater, *Foreign projects, *Asia, Evaluation, Water supply, Water utilization, Irrigation, Reclaimed water, Water analysis, Water quality, Aquifer characteristics, Canals, Brackish water.
Identifiers: *Pakistan, *Indus Plain, *Tubewells.

Summarized are findings of a team of four specialists from the U.S. Geological Survey assigned to Pakistan under the auspices of the U.S. Agency for International Development during May to August 1972 for a hydrologic evaluation of Salinity Control and Reclamation Projects in the Indus Plain. Studies were related to climatology, surface-water hydrology, and the canal system, streamflow and sediment yields of the rivers; computer applications to hydrologic data; aquifer characteristics; tubewell performance; hydrology of shallow versus deep tubewells; well and well-screen design in the Indus Plain; evaluation of observed and anticipated trends in both private and public tubewell development; evaluation of water-quality programs, data analysis, and records, and computer coding of special water-quality data; and evaluation of water-level data, well discharge and specific-capacity tests and aquifer tests. The reclamation program, by pumping from tubewells, has been notably successful in lowering the water table, in providing supplemental water for irrigation and for leaching of salinized soils, and in improving crop production. Problems associated with reclamation include control of deterioration in performance of tubewells and their rehabilitation, local brackih or saline-water encroachment, and maintenance of a favorable salt balance in the groundwater system. (Woodard-USGS)
W76-06453

LOW DRIFT SPRAY NOZZLE,
Delavan Manufacturing Corp., West Des Moines, Iowa. (Assignee)
K. E. Reed.
U.S. Patent No. 3,934,823, 6 p, 13 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 942, No 4, p 1789, January 27, 1976.

Descriptors: *Patents, *Waste water disposal, *Sewage effluents, *Irrigation, *Sprinkler irrigation, *Impaired water use, Irrigation practices, Water utilization, Irrigation efficiency, Application equipment, Nozzles, Fertilization, Pest control.

Low drift spray nozzles are used in the application of conventional herbicides, pesticides and other farm chemicals. Another application in which drift is critical is in irrigation type rigs in which partially treated sewage is applied to large tracts of land. Federal and local agencies have set limits in which drift must be confined to within 200-300 feet to the point of application. The method and nozzles of this invention are capable of utilizing substantially larger line pressures and yet generate large droplets which are not subject to drift. The liquid is formed in large droplets by imparting a swirling motion to the liquid in a chamber of the nozzle, passing the swirling liquid through a first orfice into another chamber of the nozzle which is larger in cross section than the orifice, and discharging the swirling liquid from the last mentioned chamber through a second orifice which is at least as large in cross section as the first orifice, whereby the discharged liquid forms a hollow geometric shape having large droplets of the liquid. (Sinha - OEIS)

APPARATUS FOR SEPARATING LOW-DENSITY LIQUID FROM A RELATIVELY MORE DENSE LIQUID SUBSTANTIALLY IMMISCIBLE THEREWITH,
Erdol-Raffinerie Neustadt G.m.b.H. and Co. (West Germany); and King-Wilkinson, Inc., Tulsa, Okla. (Assignee).
K. Disque, H. Holzgen, and P. Stauch.
U.S. Patent No. 3,935,103, 7 p, 8 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 942, No 4, p 1874, January 27, 1976.

Descriptors: *Patents, *Oil pollution, *Waste water treatment, *Industrial wastes, *Oil wastes, *Water quality control, Oil industry, Water pollution treatment, Water pollution control, Water pollution sources, *Separation techniques, Application equipment.
Identifiers: Tilting.

An apparatus for the removal of a relatively light or low-density liquid from a heavier or relatively high-density liquid, especially the removal of oil from water, comprises a separation vessel in which the two liquids have stratified, and a floating trough whose edges, in an uncanted position of trough, lie just above the upper surface of the low-density liquid. A discharge arrangement is connected with the trough to carry off the liquid collected and the trough is provided at its ends with a pair of floats at least one of which is internally subdivided into at least two laterally spaced trim chambers connected by a tube or passage and connected with a source of compressed or pressurized gas and the atmosphere. Trim water or another liquid is displaced from one of the chambers into the other, thereby canting the trough and bringing one of its edges below the surface of the low-density liquid so that the latter can flow into the trough and be withdrawn. When the low density liquid is present in a large quantity the height of its layer is correspondingly large and the tilting or canting angle may be correspondingly increased so that the trough is rotated about its longitudinal axis to a greater extent. When the quantity of low density liquid is less, a smaller angle of canting or rotation may be effected. (Sinha - OEIS)
W76-06473

OIL SEPARATION AND RECOVERY METHOD,
F. Gallicia.
U.S. Patent No. 3,936,377, 4 p, 9 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 943, No 1, p 337, February 3, 1976.

Descriptors: *Patents, *Oil pollution, *Oil spills, Oil-water interfaces, Water pollution treatment, *Water pollution control, Water quality control, *Separation techniques, Skimming, Flow.
Identifiers: *Oil recovery, V-shaped troughs.

The oil collection and recovery device may be towed or may be propelled by a small craft or other means to skim along the surface of the water, or it may also be used in a stationary position. If towed, the inverted V-shaped troughs are designed to impact against the water and as a result of their inclined structure, the contaminated water flows downward through the water-oil interface with the oil rising to the trough vertices because of its buoyancy, and into a collection tank where further separation occurs. If the device is motionless, jets of water are used to force the oil downward along the inverted V-shaped troughs and into the separation chamber. Once in the chamber, the oil rises and is then pumped out to an oil storage means. The relatively depolluted water is forced downward by the pressure of the following liquid, through an egress duct where it is discharged from a vent forward of the inverted V-shaped troughs and below the water surface. Expelling the relatively depolluted water in this manner serves to induce a current in the oil polluted surface water causing it to flow toward the inverted V-shaped troughs. This induced current is particularly beneficial when the device is used in the stationary position. (Sinha - OEIS)
W76-06480

MARINE DISCHARGE CONTROL APPARATUS AND METHOD FOR TREATING FLUIDS ON A MARINE VESSEL,
Keene Corp., New York. (Assignee).
I. Bartik.
U.S. Patent No. 3,937,662, 6 p, 8 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 943, No 2, p 817, February 10, 1976.

Descriptors: *Filtration, Waste water treatment, *Patents, *Oil pollution, Oily water, *Oil wastes, Water pollution treatment, Water quality control, *Water pollution control, *Separation techniques, *Filters, Coalescence, Fuels, Monitoring, Turbidity, Equipment.
Identifiers: Bilge water, Ballast water, Turbidity meters.

A method and apparatus for treating bilge and ballast water in a marine vessel operates automatically to clarify the water to the point that it can be discharged overboard without further treatment. Bilge or ballast water is pumped and supplied to a number of filter units arranged in series. The filter units, which are of a special type, provide for coalescing of the admixed fluids in individual droplets of substantial size so that the oil and water conventionally making up the bilge and ballast fluid will have a strong tendency to separate by gravity. The oil thus separated from the water is drawn off from the top of one or more of the units and delivered to an oil storage tank while the water runs sequentially through the filtering and coalescing units and yields up a fraction of the oil carried in each unit and is discharged from the final one of the filtering and coalescing units as substantially oil-free water. The water from the last of the filtering units is discharged overboard but immediately upon leaving the last of the filtering units is caused to flow through a turbidity meter which senses the degree of purity of the water (the amount of oil therein) and diverts the water away from the discharge line when the turbidity of the water exceeds a predetermined allowable maximum. (Sinha - OEIS)
W76-06483

METHOD FOR DETERMINING AND CONTROLLING LIQUID COOLING SYSTEM CHARACTERISTICS.
Brown and Root, Inc., Houston, Tex. (Assignee).
C. W. Weber, C. O. Rucker, P. L. Peavy, P. W. Woo, and J. Bear.
U.S. Patent No 3,937,973, 10 p, 5 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 943, No 2, p 908, February 10, 1976.

Descriptors: *Patents, *Cooling water, Reservoirs, *Industrial water, *Cooling, *Thermal pollution, Thermal powerplants, Thermal properties, Temperature, Water pollution treatment, Water quality control, Bodies of water, Flow characteristics.
Identifiers: *Cooling systems.

Methods are described for determining and accounting for the thermal characteristics of the cooling liquid in various types of cooling systems. Using the data provided, the flow pattern of a cooling reservoir may be controlled to maximize plant efficiency under various plant load conditions and under various climatological or meteorological conditions. Moreover, temperature standards for the discharge of cooling water into natural reservoirs may be met. The flow pattern of a cooling reservoir having a surface exposed to the atmosphere is represented by a number of water segments each representing a specified time interval, preferably equal time intervals. A thermal characteristic of the segments is determined at least periodically, preferably in response to the prevailing thermal transfer characteristics at the surfaces of the segments, and the flow pattern of the cooling reservoir is modified to accommodate the required cooling needs of the system and to prevent the discharge of cooling water into natural reservoirs if the thermal characteristics of the cooling water do not permit such discharge because of set standards. A method for at least periodically calculating the temperature of each segment from known and assumed thermal data through a trial iteration process is used. The system can also be used to determine the thermal characteristics of a natural body of water and to describe its responses to meteorological conditions. (Sinha - OEIS)

D. W. Schnare.
American Water Works Association Journal, Vol. 67, No. 9, p. 507-509 (1975). 3 p.

Descriptors: *Potable water, *Water supply, *Water quality control, *Public health, *Standards, Legal aspects, Water law, Federal government, State governments, Local governments, Governmental interrelations, Water quality, Water purification, Safety, Water quality standards, Water, Water resources, Regulation, Water pollution, Water pollution control, Water pollution abatement, Law enforcement.
Identifiers: *Safe Drinking Water Act of 1974, *National Interim Primary Drinking Water Standards.

The Environmental Protection Agency's interim primary drinking water standards require public water utilities to inform the public when any violation of a standard occurs. This requirement results in fear and confusion, and causes demand for some type of immediate action, none of which necessarily helps to achieve the goal of providing safe drinking water. A wiser plan would be to educate the public concerning the rationale behind each standard, the actual health risk involved in a violation of a standard and the means by which the water supply will be returned to compliance. Another weakness of the present policy is the prohibitive cost to local authorities of the surveillance requirements of the standards. These requirements should be reexamined to determine if their cost is justified by the potential health risk were they to be eliminated. (Nursey-Florida)

POLLUTION--RIGHT OF SHIPOWNER TO CONTRIBUTION FROM UNITED STATES WHERE NEGLIGENCE OF COAST GUARD WAS A CAUSE OF CASUALTY AND ENSUING SPILL. BURGESS V. THE TAMANO, 373 F SUPP 839 (D ME 1974),
J. D. Kimball.
Journal of Maritime Law and Commerce, Vol. 6, No. 4, p. 665-67 (1975). 3 p.

Descriptors: *United States, *Judicial decisions, *Ships, *Oil spills, *Costs, Oceans, Oil pollution, Water pollution, Water pollution sources, Navigation, Transportation, Water, Water law, Legal aspects, Coasts, Federal government, Commercial fishing, Damages.
Identifiers: *Suits in Admiralty Act, Standing(Legal), Sovereign immunity, Negligence, Torts.

The case of Burgess v. The Tamano arose out of the grounding of the tanker Tamano, which resulted in a major oil spill. The Coast Guard subsequently undertook to contain and remove the spilled oil. In its decision, the court held that the private plaintiffs, landowners, boat owners, and commercial fishermen, had standing to maintain an action for pollution damages against the United States. The government had contended that plaintiffs were not 'maritime interests' to whom the government owed a duty of care. Rejecting this argument, the court concluded that plaintiffs were entitled to sue under the Suits in Admiralty Act, even if they were not 'maritime interests'. A second major issue in the case concerned the vessel owners' right to contribution and/or indemnity. The court, following recent decisions, held that the owners had stated a viable claim for contribution. If they successfully established the joint negligence of the United States, the owners were entitled to contribution. However, the court held that the owners' claim for indemnification had no basis either in contract or in tort. In so holding, the court agreed with a prior decision that, although the government may be liable for negligence in the performance of cleanup activities, such liability cannot be based on a theory of breach of warranty. (Schilling-Florida)

NEBRASKA NPDES PERMIT REGULATIONS.
In: 1974 BNA Environmental Rep. 836:0661-70 Rules and Regs Pertaining to the Issuance of Permits Under the National Pollutant Discharge Elimination System, 1974). 10 p.

Descriptors: *Nebraska, *Permits, *Waste water disposal, *Water quality standards, *Waste disposal, Discharge(Water), Effluents, Water pollution sources, Water quality control, Waste water(Pollution), Radioactive waste disposal, Water pollution, Waste disposal, Waste treatment, Environmental effects, Administration, Administrative agencies.
Identifiers: Fact sheets, Public hearings.

Unless specifically exempted, all persons must obtain a National Pollutant Discharge Elimination System (NPDES) permit before they can discharge any pollutants from a point source into navigable waters of Nebraska. Before any final decision is made concerning the issuance or denial of the permit, the Nebraska Department of Environmental Control must make a tentative decision based upon existing standards adopted by the Environmental Control Council. Public notice containing specified information about the application and the tentative determination shall be made in a specified manner. If an applicant's potential discharge is over 500,000 gallons a day, the Department must also prepare a fact sheet describing proposed plans to be sent to any person or group upon request. After 30 days have elapsed from public notice, the Department may make its final decision. Whether a public hearing will be required before this final determination is made will depend upon attendant circumstances. If the application is given final approval, the conditions of each issued NPDES permit must comply with minimum applicable standards adopted by the Council. (Hoffman - Florida)
W76-06495

NEVADA WATER POLLUTION CONTROL LAWS.
In: 1974 BNA Environmental Rep. 841: 0101-07 (Nev. Rev Stats, Title 40, Ch 445, Secs 445. 131 through 445.354, 1973). 7 p.

Descriptors: *Nevada, *Radioactive waste disposal, *Waste water disposal, *Water pollution control, *Permits, Effluents, Monitoring, Penalties(Legal), Waste disposal, Waste treatment, Water quality control, Water pollution sources, Discharge(Water), Waste water(Pollution), Legislation, Regulation, State governments.
Identifiers: *Pretreatment standards.

Unless specifically exempted, all persons must obtain a permit before they can lawfully discharge pollutants from a point source into any Nevada waters. The procedural steps and requirements pertaining to the application for, issuance and revocation of this permit are set forth. If the application is approved, the conditions of each permit must comply with the following: effluent limitations; standards of performance for new sources; effluent standards, effluent prohibitions and pretreatment standards; and any more stringent limitations. Any permits issued will be for a fixed period not to exceed five years, and may be renewed if specified requirements are satisfied. Set forth also are provisions for monitoring and recording discharges. When violations are detected, and they are not corrected at the request of the commission, criminal and civil sanctions may be imposed. Notwith-standing any of the above provisions, no permit may authorize the discharge of any radiological, chemical or biological warfare agent or high level radioactive waste into state waters. A permit may be obtained, however, to discharge, deposit or dispose of such wastes underground in liquid or explosive form. (Hoffman-Florida)
W76-06496

OREGON WATER QUALITY CONTROL REGULATIONS.
Oregon Dept. of Environmental Quality, Salem.
In: 1975 BNA Environmental Rep. 886:0501-26 (Ore. Ad. Rules, Ch. 340 Div. 1, Subdivisions 2 thru 8). 26 p, 14 tab.

Descriptors: *Permits, *Oregon, *Water quality control, *Waste water treatment, *Water quality standards, Thermal pollution, Legislation, Hydrogen ion concentration, Fungi, Dissolved oxygen, Radioisotopes, Basins, Streams, Streamflow, Water pollution sources, Penalties(Legal), Waste water disposal.
Identifiers: *Receiving streams.

To prevent unauthorized pollution, Oregon requires that a permit must be obtained before a person may discharge wastes into state waters. The degree of waste treatment that will be required before allowing the discharge will depend on the uses made of the receiving stream, the size of the receiving stream and the presence or absence of other sources of pollution in the same watershed. Regardless of any of these factors, the waste treatment required will always be the highest and best practicable treatment available. In addition, no wastes may be discharged if such discharge will cause any waters of the state to fail to meet general or special water quality standards. The general water standards, which are applicable to all state waters, pertain to: dissolved oxygen content, hydrogen ion concentration, fungi development, thermal limits, radioisotope concentrations, and several other specified factors. The special standards, which are applicable to particular basins throughout the state are concerned with the same factors as the general standards; however, they will be controlling whenever there is a direct conflict. To assure compliance with all the provisions of these regulations, civil and criminal penalties are provided for any violations. (Hoffman-Florida)
W76-06497

WISCONSIN WATER POLLUTION CONTROL LAWS.
In: 1973 BNA Environmental Rep 951:0101-20 (Wisc Stats, Ch 144, as amended by Laws 1971; Ch 147, 1973). 20 p.

Descriptors: *Permits, *Wisconsin, *Water quality control, *Administrative agencies, *Waste water disposal, Regulation, State jurisdiction, Effluents, Sewage treatment, Monitoring, Public health, Administration, Water quality standards, Water resources development, Water pollution treatment, State governments, Administrative decisions.
Identifiers: Procedural requirements.

To determine the nature and extent of pollution in state waters, the Wisconsin Department of Resource Development is authorized to conduct a comprehensive water survey. The Department, which is created by this statute, shall serve as the central governmental unit in charge of protecting and improving the quality of state waters. The Department will be advised and kept abreast of local conditions and problems by newly established regional advisory boards. To achieve its statutory goals, the Department is given numerous duties and powers, including the authority to: adopt water quality standards; exercise general control over state waters; adopt rules pertaining to waste treatment facilities; and establish a water pollutant discharge elimination system (WPDES). As to the WPDES, the Department is directed to implement a permit system to control effluent discharges. The procedures for the application for, issuance and revocation of this permit are set forth. The statute also presents comprehensive regulations pertaining to: the operation of sewage disposal systems; the monitoring and inspection of all wastewater discharging facilities; and the procedural requirements relating to public hearings and public notice which are required by numerous sections of the statue. (Hoffman-Florida)
W76-06498

WISCONSIN DISCHARGE PERMITS REGULATIONS.
In: 1975 BNA Environmental Rep. 951:0501-05 (Wisc. Ad Code, Ch NR 200, 1974 as amended 1975; Ch NR 201, 1974 and Ch NR 220, 1974). 5p.

Descriptors: *Wisconsin, *Waste disposal, *Permits, Waste treatment, *Sewage effluents, Municipal wastes, Industrial wastes, Mining, Public rights, Effluents, Water pollution, Sewage disposal, *Waste water treatment, Environmental sanitation, Water quality control, Administration, Decision making.
Identifiers: *Permit systems, Point sources of pollution, Public hearings.

To protect the quality of Wisconsin waters, and in the absence of any special exemption, a permit must be obtained for the lawful discharge of any pollutant. The general filing requirements pertaining to the application for such a permit are set forth. The information contained in this application will be the basis for the denial or issuance of the permit and shall be made available to the public unless the information is designated as confidential. To aid the Environmental Protection Agency in the processing of these applications, special short form applications are available if the applicant is the owner or operator of a municipal wastewater system, agricultural operation, manufacture or mining establishment, or service, wholesale or retail establishment. If the facility will have the potential to handle 500,000 gallons of

discharge a day, the applicant cannot use the short form and must use the applicable standard form. Before a permit may be approved for an applicant required to use the standard form, the department must prepare a fact sheet containing specified information which must be sent to interested persons on request. Finally, the regulations list 42 categories of point sources for which effluent standards and standards of performance are to be adopted. (Hoffman-Florida)

WISCONSIN WATER QUALITY STANDARDS.
In: 1974 BNA Environmental Rep. 951:1001-08 (Wisc. Ad. Code, Chs. N.R. 102 thru 104, 1973). 8 p.

Descriptors: *Interstate, *Water types, *Wisconsin, *Federal Water Pollution Control Act, *Water quality standards, Thermal pollution, Recreation, Water pollution sources, Water supply, Permits, Waste water disposal, Waste water treatment, Streamflow, Mixing, Water policy, Water pollution.
Identifiers: *Antidegradation, *Mixing zones.

Pursuant to the Federal Water Pollution Control Act Amendments of 1972, Wisconsin promulgated water quality standards to aid in the prevention and abatement of water pollution. To assure that water quality meets minimum requirements, several general conditions are presented which must be met by all waters at all times. In addition to these general requirements, some waters must meet additional special standards, including: (1) thermal standards; (2) standards for fish and aquatic life; (3) standards for recreational use; and (4) standards for public water supply. Furthermore, the statute presents requirements relating to antidegradation, streamflow, and mixing zones. To aid in the enforcement of all of the above standards, a permit system is initiated which will pertain to all waste water discharges. To make the above water quality standards applicable, the statute designates uses and standards for all interstate and intrastate waters. For example, Fox River is designated to be used for recreation, waste assimilation, industrial supply, fishing, and irrigation. Thus, the water quality of fox River must meet the standards for recreational use and fish and aquatic life. Finally, with regard to intrastate waters, certain variances and additions for different districts of the state are presented. (Hoffman-Florida)
W76-06501

UTAH WATER QUALITY STANDARDS,
In: 1973 BNA Environmental Rep. 926: 0541-45 (Code of Waste Disposal Regs, Part II, 1965; as amended 1967 and 1968). 5p.

Descriptors: *Utah, *Water quality standards, *Colorado River, *Water quality control, *Classification, Upstream, Downstream, Water pollution, Legislation, Regulation, Hydrogen ion concentrations, Turbidity, Dissolved oxygen, Radioactive wastes, Biochemical oxygen demand, Beneficial uses, Economics, Social aspects.
Identifiers: *Antidegradation.

Because strict compliance with water quality standards would often allow uncontrolled pollution of exceptionally high quality waters, the state of Utah has adopted an antidegradation policy which requires that waters of a higher quality than current standards be maintained at that level. This policy may be relaxed if it can be affirmatively shown that economic and social factors make the current high quality level unrealistic. The regulation also recognizes the cumulative effects pollution may have. Thus, higher quality standards will generally be set for upstream waters than for downstream waters. No wastes may be discharged into state waters if such discharge would violate specific standards pertaining to the water body's classification. These standards, which vary for different classes of water, pertain to: radioactive limitations; hydrogen ion concentrations; organic chemical limitations; coliform limitations; dissolved oxygen; turbidity; and biochemical oxygen demand. An appendix to this statute presents guidelines for formulating water quality standards for the interstate waters of the Colorado River system. Because these waters are used for numerous purposes, maximum effort should be made to maintain the highest possible water quality level. To achieve this goal, provisions are presented pertaining to minimum quality criteria applicable to interstate waters at agreed state line sampling points. (Hoffman-Florida)
W76-06503

WASHINGTON WATER POLLUTION CONTROL LAWS,
In: 1973 BNA Environmental Rep. 941:0101-16 (Wash Rev Code, Ch. 90.48, amended by Laws 1971 and 1973; Ch. 90.50, 1971; Ch. 90.52, 1971 and Ch. 90.54, 1971). 16p.

Descriptors: *Washington, *Water pollution control, *Waste water disposal, *Permits, *Federal Water Pollution Control Act, Ecology, Economics, Waste treatment, Government finance, Effluents, Water quality standards, Watersheds(Basins), Facilities, Water pollution sources, Pollutants, Discharge(Water).
Identifiers: *Waste disposal systems.

To insure the purity of all state waters, the Washington water pollution control commission is directed to set up a comprehensive water pollution control program. As part of this program, the commission is authorized to set quality standards for all state waters and for substances discharged therein. Since the discharge of substances has been a major factor in water pollution, all persons must obtain a permit before they can lawfully discharge polluting substances into state waters. A permit must also be obtained before any person may operate a waste disposal system. The procedural requirements and steps involved in the application, issuance, and revocation of these permits are set forth. Because of the necessarily broad scope of an effective water pollution program, the commission is also given the powers to delineate and establish sewage drainage basins, to financially assist eligible recipients in the construction of water pollution control facilities, and to thoroughly investigate any incidents involving the unauthorized entry of oil into state waters. This statute also creates the department of ecology to serve as the State Water Pollution Control Agency for all purposes of the Federal Water Pollution Control Act (FWPCA). The department is authorized to participate in any programs of the FWPCA which will result in benefits to the state. (Hoffman-Florida)
W76-06504

WASHINGTON WASTE WORKS REGULATIONS.
In: 1973 BNA Environmental Rep. 941:0581-85 (Wash. Ad. Code, Ch 372-20). 5 p.

Descriptors: *Washington, *Sewage treatment, *Design data, *Permits, *Design standards, Facilities, Waste treatment, Construction materials, On-site tests, Monitoring inspection, Industrial wastes, Municipal wastes, Water supply, Topography, Legislation.
Identifiers: *Pump stations.

Because sewerage systems are continually being expanded, approval of a municipal sewerage system may be obtained from The Washington State Pollution Control Commission without the submission of detailed plans. However, the municipality must obtain approval of a report containing general layout map and construction specifications of the system. This layout map shall include the following items: boundaries; existing and proposed sewers; existing and proposed pump stations; topography and elevations; bodies of water; and public water supplies. Sewerage treatment works are generally built to meet a specific need. Consequently, before approval will be granted for its construction, an engineering report must be submitted. Because this report contains basic design data, and forms the basis for the preparation of the construction drawings, it will allow the commission to make an intelligent evaluation of the proposed project. To insure compliance with approved designs, the commission must make adequate and competent inspections during the construction period. Once the construction is complete and operation has begun, the owner must keep adequate records and must make such tests as are necessary to assure that the plant is operating at its highest practical efficiency. The statute also presents provisions pertaining to the construction and operation of industrial waste treatment works. (Hoffman-Florida)
W76-06507

WASHINGTON WATER POLLUTION CONTROL PLANNING REGULATIONS.
In: 1973 BNA Environmental Rep. 941: 0701-0 (Wash. Ad. Code, Ch 372-68). 5 p, 2 map.

Descriptors: *Washington, *Water quality control, *Planning, Watersheds(Basins), *Project planning, Administration, Water management(Applied), Administrative agencies, Capital costs, Facilities, Economics, Coordination, Legislation, Regional development, Environment.
Identifiers: Public hearings.

To insure a high quality of state water the Washington legislature has promulgated regulations pertaining to water pollution control and abatement plans for sewage drainage basins. The initial drainage basin plan will be prepared by the planning agencies having authority over a particular basin. This plan should include the following: (1) a statement of the purpose of the plan and a summary of its findings; (2) the basis for planning such as a description of the physical environment and projected social and economic growth; (3) an inventory of existing facilities and sources and characteristics of wastes; (4) a description of present and future water pollution control needs; (5) a capital improvements program; (6) formal and updating; and (7) other pertinent plan considerations. Once a plan has been prepared, it must be presented to the water pollution control commission for approval. If the commission tentatively approves the plan, a public hearing must be held to allow the public the opportunity to make oral statements. After this public hearing, the commission may make its final decision. If the plan subsequently requires amendment, specific procedures must be followed. (Hoffman-Florida)

WASHINGTON NPDES PERMIT PROGRAM REGULATIONS,
In: 1974 BNA Environmental Rep. 941:0781- (Wash. Ad. Code, Ch. 173-220, 1974, as amended 1974). 8 p.

Descriptors: *Washington, *Discharge(Water), *Permits, *Water quality control, *Water quality standards, State governments, Effluents, Water pollution sources, Administration, Administrative agencies, Legislation, Radioactive waste disposal, Waste water(Pollution), Environmental effects, Waste disposal, Waste water disposal.
Identifiers: *National Pollutant Discharge Elimination(NPDES), Permit, Public notice, Public hearings.

Unless specifically exempted, all persons must obtain a state National Pollutant Discharge Elimi

ion System (NPDES) permit before they can lischarge any pollutants from a point source into avigable waters of the state of Washington. Be- ore any final decision is made concerning the is- uance or denial of the permit, the Department of Ecology must make a tentative determination ased upon proposed standards set forth in the ap- lication. Public notice containing information bout applications and the tentative determination hall be made in a specified manner. If an appli- ant's potential discharge is over 500,000 gallons er day, the Department must also prepare a fact heet describing the proposed plans to be sent to ny person upon request. After allowing 30 days or the receipt of public comments, the Depart- ent may make its final decision. Whether a ublic hearing will be required before this final ecision is made will depend on attendant circum- tances. If the permit application is given final ap- roval, the conditions of each issued NPDES per- it must comply with applicable effluents limita- ons and water quality standards. (Hoffman-lorida)

/ASHINGTON WATER QUALITY STAN- ARDS.
n: 1974 BNA Environmental Rep. 941:1001-09 Wash. Ad. Code, Ch 173-201, 1973, as amended 973). 9 p, 1 tab.

escriptors: *Water types, *Washington, *Water uality control, *Classification, *Water quality tandards, Dissolved oxygen, Coliforms, Turbidi- , Temperature, Hydrogen ion concentration, adioactive wastes, Aesthetics, Toxins, Permits, ollutants, Administration, Legislation, State overnments, Penalties(Legal), Waste water isposal.
lentifiers: *Water classification.

n order to establish a comprehensive water quali- program, all Washington state waters shall be lassified as Class AA (extraordinary), Class A xcellent), Class B (good), Class C (fair), or Lake lass. Each of these classes will have specified equirements pertaining to the following water uality criteria: total coliform organisms; dis- olved oxygen; total dissolved gas; temperature; ydrogen ion concentration; turbidity; toxic, dioactive, or deleterious material concentra- ons; and aesthetic values. With these require- ents as a basis, state waters are classified in one the above five classes. Thus, if a particular river classified as Class B, all necessary steps must be ken to insure that the river meets Class B quirements. A list of all state waters, and their assifications are presented. To help enforce this rogram, the Department of Ecology shall set up a rmit system to control the discharge of polluting bstances. A surveillance program is authorized ascertain whether the conditions of any issued rmits are being followed. The department is also ven the power to issue regulatory notifications, ders, and directives to any person who is, in the partment's opinion, polluting or about to pollute ate waters. Civil and criminal penalties are pro- ded for the violation of any of the provisions of e statute. (Hoffman-Florida)
76-06511

ATER QUALITY STANDARDS--COLORADO VER SYSTEM (SALINITY CONTROL POL- Y AND STANDARDS PROCEDURE).
ivironmental Protection Agency, Washington, C.
Fed. Reg. 43721-23 (1974). 3 p.

escriptors: *Adoption of practices, *State vernments, *Colorado River Basin, *Water ality standards, *Salinity, Arizona, California, olorado, Nevada, New Mexico, Utah, Wyoming, deral Water Pollution control Act, Salts, reams, Drainage area, Diversion, Standards, Ir- ation, Agriculture, Management, Abatement.

This notice sets forth a policy of maintaining salinity concentrations in the Colorado River System at or below 1972 average levels. It also requires the Colorado River System states to promulgate water quality standards and a plan for meeting the standards. The first step will be the establishment of procedures within thirty days of the effective date of these regulations for the adoption on or before October 18, 1975, of water quality standards for salinity including numerical criteria and an implementation plan for salinity control. The goal of the plan shall be to achieve compliance with the adopted standards by July 1, 1983. Comments and suggestions of interested parties are summarized, as well as specific objections of the Sierra Club to the proposed regulation. (Segall-Florida)
W76-06512

EFFLUENT GUIDELINES -- STEAM ELECTRIC POWER GENERATING POINT SOURCE CATEGORY.
Environmental Protection Agency, Washington, D. C.
40 Fed. Reg., 7095-96 (1975). 2 p.

Descriptors: *Power system operation, *Waste water(Pollution), *Discharge(Water), *Recirculated water, *Regulation, Waste treatment, Waste water disposal, Water quality control, Water quality standards, Administration, Administrative agencies, Water pollution sources, Industrial wastes, Industrial water, Wastes, Environmental control.
Identifiers: Administrative regulations.

The Environmental Protection Agency herein amends and corrects subparts A through D of its Steam Electric Power Generating Point Source Category regulations. 'Blowdown' is defined as the minimum discharge of recirculating water for the purpose of discharging materials contained in the process, the further buildup of which would cause concentrations or amounts exceeding limits established by best engineering practice. 'Low volume waste source' is defined as waste water from all sources except those for which specific limitations are otherwise established. 'Recirculated cooling water' is defined as water which is first passed through the main cooling condensers for the purpose of removing waste heat from the generating unit, then through a cooling device for the purpose of removing such heat from the water, and finally passed again, except for blowdown, through the main cooling condensers. Various editorial and typographical errors are likewise corrected. (Welch-Florida)
W76-06513

INORGANIC CHEMICALS MANUFACTURING POINT SOURCE CATEGORY.
Environmental Protection Agency, Washington, D. C.
40 Fed. Reg. 7106-09 (1975). 4 p.

Descriptors: *Waste water(Pollution), *Waste disposal, Pollutants, *Federal Water Pollution Control Act, *Discharge measurement, Cooling water, Streams, Effluents, Permits, Rainfall, Runoff, Equipment, Industries, Data collections, Chemicals, Pollutant identification, Pollution abatement.
Identifiers: Contaminated non-process waste water, Process waste water, Point sources.

Amendments are proposed to the Inorganic Chemicals Manufacturing Point Source Category. The affected portions are Chlorine and Sodium or Potassium Hydroxide Production Subcategory,Hydrochloric Acid Production Subcategory, Nitric Acid Production Subcategory, Sodium Dichromate and Sodium Sulfate Production Subcategory, Sodium Metal Production Subcategory, Sodium Silicate Production Subcategory, and Sulfuric Acid Production Subcategory. Previously, point sources in these categories were required to achieve no discharge of 'process waste water pollutants'. Now it appears that the existing definition of process waste water may be overly broad since it can be construed to apply to waste streams other than those directly connected with the production effort. Accordingly the Environmental Protection Agency is proposing to add to these subparts a definition of 'contaminated non-process waste water' for the purpose of distinguishing between those pollutant bearing streams that are attributable to production and those ancillary streams that are not. The Agency has identified four ancillary sources of pollution from plants which should be controlled by available technology to which a no-discharge standard will not always be appropriate. The four sources and associated limitations on pollutant discharge are specified in the proposed amendments. (Segall-Florida)
W76-06514

TIRE AND SYNTHETIC SEGMENT OF THE RUBBER PROCESSING POINT SOURCE CATEGORY.
Environmental Protection Agency, Washington, D. C.
40 Fed. Reg. 7109-10 (1975). 2 p.

Descriptors: *Classification, *Water quality control, *Waste water disposal, *Waste water treatment, *Federal Water Pollution Control Act, *Effluent streams, Water quality standards, Water pollution control, Water pollution sources, Waste disposal, Water resources, Regulation, Administrative agencies, Administration, United States.
Identifiers: Administrative regulations.

Pursuant to the Federal Water Pollution Control Act, as amended, the Environmental Protection Agency herein proposes amendments to the effluent limitations and guidelines for existing sources, and standards of performance and pretreatment standards for new sources, for the tire and synthetic segment of the rubber processing point source category. The regulation clarifies which process waste water streams should be regulated, and distinguishes between process and nonprocess waste water streams in tire and inner tube plants constructed before 1959 which were not designed to segregate process waste water and nonprocess waste water. 'Process waste water' is defined as discharges from: soapstone solution applications; stream cleaning operations; air pollution control equipment; unroofed process oil unloading areas; mold cleaning operations; latex applications; and air conditioner receivers. A provision of the proposed regulation would control the cncentration of oil and grease in nonprocess waste water for tire and inner tube plants constructed prior to 1959. (Welch-Florida)
W76-06516

SOAP AND DETERGENT MANUFACTURING CATEGORY (PRETREATMENT STANDARDS FOR INCOMPATIBLE POLLUTANTS).
Environmental Protection Agency, Washington, D. C.
40 Fed Reg 7580-83 (1975). 4 p.

Descriptors: *Chemical oxygen demand, *Detergents, *Standards, *Treatment facilities, *Organic wastes, Federal Water Pollution Control Act(FWPCA), Pollutants, Waste water(Pollution), Discharge measurement, Oxygen, Degradation(Decomposition), Alcohols, Statistical methods, Construction, Design, Recycling, Evaluation, Biochemical oxygen demand.
Identifiers: *Discharge streams.

The Environmental Protection Agency (EPA) has proposed regulation concerning the revision of pretreatment standards for new sources. The proposal will supplant portions of the Soap and Detergent Manufacturing Point Source Category, establishing for the manufacture of certain detergents therein the standards of pretreatment for new sources which discharge to publicly owned

treatment works. After evaluations of information relevant to the discharge of waste waters of the soap and detergent manufacturing industry to publicly owned treatment works, the EPA proposes the following modifications to the pretreatment standards for new sources in the industry: (1) parameters and limitations will be referenced to the discharge stream from the affected source within a subcategory, not to finished products; (2) requirements for pretreatment will be defined in terms of a ratio of chemical oxygen demand (COD) to biochemical oxygen demand (BOD) of the discharge streams, as defined in the regulations and amendments; and (3) for waste streams with COD/BOD7 ratios greater than ten and COD content above specified levels, the pretreatment standards shall be as specified in this notice. (Segall-Florida)
W76-06517

EFFLUENT GUIDELINES AND STANDARDS - FERROALLOYS MANUFACTURING POINT SOURCE CATEGORY.
Environmental Protection Agency, Washington, D. C.
40 Fed Reg 8030-37 (1975) 8 p.

Descriptors: *Effluents, *Discharge(Water), *Waste water disposal, *Water quality control, *Federal Water Pollution Control Act, Regulation, Administrative agencies, Administrative decisions, Industrial wastes, Industrial water, Environmental control, Water quality standards, Wastes, Waste dilution, Water pollution control, Industrial plants, Pollutants.
Identifiers: Administrative regulations.

Pursuant to the Federal Water Pollution Control Act, as amended, the Environmental Protection Agency herein establishes effluent limitations and guidelines for existing sources and standards of performance and pretreatment standards for new sources for the ferroalloy manufacturing point source category. The regulation provides control standards for the discharge of pollutants which reflect the greatest degree of effluent reduction which the agency determines to be achievable. The calcium carbide and electrolytic ferroalloys segments of the ferroalloys industry are divided into subcategories on the basis of water uses, waste control technologies, and waste water constituents. For each subcategory effluent limitations and standards of performance are established. An economic impact analysis revealed that the modest cost increases generated by compliance with the guidelines can be passed on without significantly effecting product demand and employment. (Welch-Florida)
W76-06518

FERROALLOY MANUFACTURING POINT SOURCE CATEGORY.
Environmental Protection Agency, Washington, D. C.
40 Fed. Reg. 8038-41 (1975). 4 p.

Descriptors: *Federal Water Pollution Control Act, *Waste disposal, *Water pollution control, *Pollutants, *Effluents, Waste disposal, Environmental effects, Regulation, Legislation, Water quality, Administrative agencies, Adoption of practices, Waste water(Pollution), Federal government, Sewage treatment, Treatment facilities, Environmental control, Treatment.
Identifiers: Administrative regulation.

The Environmental Protection Agency has proposed amendments to Chapter 40 of the Code of Federal Regulations concerning effluent limitations and guidelines for existing sources and standards of performance and pretreatment standards for new sources for the ferroalloys manufacturing point source category. The proposed amendment will add a 'covered calcium carbide furnaces with wet air pollution control devices' subcategory to the other calcium carbide furnaces subcategories. Section 307(b) of the Federal Water Pollution Control Act requires such regulation standards for pollutants introduced into publicly owned treatment works, and federal regulations require that EPA propose such specific pretreatment standards at the time effluent limitations are established for point source discharges. The amendment includes both pretreatment standards for existing and new source discharges and standards of performance for new source discharges. The pretreatment regulation proposed applies to the introduction of pollutants which are directed into a publicly owned treatment works rather than those discharged into navigable waters. (Welch-Florida)
W76-06519

EFFLUENT LIMITATIONS AND GUIDELINES - PRINTING INK FORMULATING POINT SOURCE CATEGORY.
Environmental Protection Agency, Washington, D. C.
40 Fed. Reg. 8307-11 (1975). 5 p.

Descriptors: *Federal Water Pollution Control Act, *Landfills, *Classification, *Waste treatment, *Waste water treatment, Regulation, Solid wastes, Liquid wastes, Water pollution sources, Water quality control, Legislation, Navigable waters, Waste disposal, Ultimate disposal, Economics, Environmental control, Energy dissipation.
Identifiers: *Printing ink, *Liquid concentrates.

Pursuant to the Federal Water Pollution Control Act, the Environmental Protection Agency (EPA) is publishing proposed regulations concerning the oil-base ink subcategory and water-base ink subcategory of the printing ink formulating point source category. The printing ink category was divided into these subcategories primarily because of differences in their waste water treatability. The EPA found thaT the best practicable control technology currently available for both subcategories is no discharge of waste water pollutants into navigable waters. The most commonly employed systems by which the standard is obtained in each subcategory is presented. The best available and practicable control technology also requires that pollutants removed from waste water be disposed of in the form of solid wastes and liquid concentrates. Although most of the pollutants removed are non-hazardous some are hazardous; therefore, special care should be taken when selecting landfill sites. The precautions and factors that should be considered in making such site selection are presented. Provisions are also set forth relating to the impact of these regulations on cost estimates; energy requirements; environmental control; standards of performance for new sources; and pretreatment standards for new sources. (Hoffman-Florida)
W76-06520

NONFERROUS METALS MANUFACTURING POINT SOURCE CATEGORY.
Environmental Protection Agency, Washington, D. C.
40 Fed Reg 8514-29 (1975). 16 p, 14 tabs.

Descriptors: *Waste water treatment, *Classification, *Federal Water Pollution Control Act, *Copper, *Water quality standards, Legislation, Copper compounds, Wastes, Discharges(Water), Pollutants, Waste water disposal, Waste treatment, Waste disposal, Waste water(Pollution), Regulation, Administrative agencies, Effluents.
Identifiers: *Nonferrous metals, Point source pollution.

Pursuant to the Federal Water Pollution Control Act, the Environmental Protection Agency (EPA) has promulgated effluent limitations and guidelines for existing sources for the primary copper smelting subcategory, the primary copper refining subcategory, the secondary copper subcategory, the primary lead subcategory, and the primary zinc subcategory of the nonferrous metals manufacturing point source category. The EPA is also proposing standards of performance and pretreatment standards for the above subcategories. The general methodology used in developing these limitations, guidelines and standards are set forth. Provisions pertaining to the waste characteristics and to the origin of waste water pollutants of each of the subcategories are also set forth. Finally, the regulations contain effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best available technology economically achievable and effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best practicable control technology currently available. (Hoffman-Florida)
W76-06521

INTERIM PRIMARY DRINKING WATER STANDARDS.
Environmental Protection Agency, Washington, D.C.
40 Fed. Reg., 11990-98 (1975). 9 p, 5 tab.

Descriptors: *Potable water, *Water quality standards, *State governments, Analytical techniques, *Water supply development, Organic compounds, Inorganic compounds, Coliforms, Turbidity, Pesticides, Sampling, Administrative agencies, Federal jurisdiction, State jurisdiction, Pollutants, Regulation, Legislation, Water supply, Analysis, Federal government.
Identifiers: *Safe Drinking Water Act.

As the first step in the implementation of the Safe Drinking Water Act (SDWA), the Environmental Protection Agency (EPA) is proposing regulations setting forth interim primary drinking water standards. These standards set maximum contaminant levels for the following: inorganic chemicals; organic chemicals; pesticides; turbidity; and coliforms. To insure compliance with these standards, provisions are presented concerning sampling and analytical requirements for each of the above contaminants. In addition, the regulations set forth reporting requirements concerning the results of these analytical tests. The SDWA not only provides for the promulgation of water standards, but also provides for the promulgation of siting requirements concerning the location of new or expanded water supply systems. The EPA, however, does not have a veto power over the location of such systems, although state agencies may have such a power. Despite the above standards and requirements, the primary responsibility for the implementation of the Act will rest with individual states, rather than with the federal government. Thus, when the state demonstrates the ability to effectively implement the Act, the federal government will play only a passive role. (Hoffman-Florida)

VALUATION OF POLLUTION ABATEMENT ECHNIQUES APPLICABLE TO LOST CREEK ND BROWN'S CREEK WATERSHED, WEST IRGINIA.
ckenheil and Associates Geo Systems, Inc., Pitt-urgh, Pa.
vailable from the National Technical Informa-on Service, Springfield, Va. 22161 as PB-242 722. .00 in paper copy, $2.25 in microfiche. Prepared r the Appalachian Regional Commission, ashington, D.C. October 31, 1973. 146 p, 5 fig, 11 b.

escriptors: Water quality, *Acid mine water, Coal mine wastes, Water pollution control, Reverse osmosis, *Environment impact, Alternative planning, Acidic water, Pollutants, ater pollution treatment, *West Virginia, Pollution abatement, Watersheds(Basins).
entifiers: Lost Creek(WV), Brown's reek(WV), Hamson County(WV), Clark-urg(WV).

his study is one of a series of reports concerning e development of an overall environmental pol-tion abatement plan for the Monongahela River asin. Primary objectives are to evaluate applica-e pollution reduction methods and provide recommendations as to least cost and best overall solutions to mine drainage problems. Study results are based on water quality data from previous investigations and on supplementary data gathered during this study. Conclusions are: that water quality of the creeks has improved significantly; that the 4 identified drainage sources discharge 4800 lbs/day acid load and 600 lbs/day iron load to the principal streams; that conventional surface reclamation and treatment are methods best suited for abatement; that a least cost abatement plan has been developed which would provide an 80% reduction in acid and iron loads; and that a long term plan of abatement has been developed which considers associated long-range environmental benefits such as 90% reduction in acid and iron loads, a reverse osmosis facility, a sewage treatment plant and aesthetic improvements in other areas of the watersheds. Primary recommendations are: that a program be implemented as soon as practical to perform the described surface reclamation work in accordance with established priorities; that a program to secure funds and obtain preliminary design data for treatment plant possibilities be started with emphasis placed on pursuing the long term plan for the watershed. (Salzman-North Carolina)

DEVELOPMENT OF A PRIORITY DETERMINATION PROCEDURE.
Rivkin/Carson, Inc., Washington, D.C.; and Edwards (Arthur) Associates, Washington, D.C.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-242 669, $5.25 in paper copy, $2.25 in microfiche. Prepared for the Appalachian Regional Commission, Washington, D.C., March 1972. 115 p, 11 fig, 4 append. 14010-HOC-1.

Descriptors: *Mine drainage, *Economic impact, *Pollution abatement, *Priorities, Methodology, *Decision making, Watershed management(Applied), *Investment, Water pollution control, Air pollution, Soil contamination, River basin development, Environment, Maryland, Pennsylvania, West Virginia.
Identifiers: *Monongahela River Basin(MD PA WV).

This study of the Monongahela River Basin in MD, PA and WV gives a procedure for developing rankings of environmental problems. A central idea is that although pollution abatement aims at improving environmental quality, it is also a project to help stimulate the local economy. There are several basic objectives: abatement project investments should support economic development; projects are selected on the basis of contribution toward designated standards; and strategies and fund allocation must be viewed to ensure general environmental improvement at a given site; investment must be selective in order to achieve the most at the least cost; investment will be made where more rather than fewer people are affected, the economy is stronger, growth is anticipated, and where public investments are ongoing; and laws must be recognized. Because pollution is concentrated in some areas and not others, the region was divided into pollution abatement zones which are the primary units for assessing pollution and investment. After a given amount of money is assigned to a zone, priorities are given which will maximize benefits within that zone. Sub-basins and county areas were used for socio-economic analysis and administrative areas, respectively. The procedural steps are: (1) inventory information on pollution, the economy, other abatement attempts; (2) measure and assign values to pollution within pollution abatement zones, to the importance of abatement, and to the effort; (3) composite rating of pollution abatement zones and an assessment of the relative importance of illegal pollution; (4) project identification; (5) selection of projects. CORRECTIVE TAXES FOR POLLUTION CONTROL: AN APPLICATION OF THE ENVIRONMENTAL PRICING AND STANDARDS SYSTEMS TO AGRICULTURE,
California Univ., Santa Cruz. Dept. of Economics.
L. W. Abrams, and J. L. Barr.
Journal of Environmental Economics and Management, Vol. 1, p. 296-318, 1974. 6 fig., 11 tab., 2 ref.

Descriptors: *Pollution taxes(Charges), *Tax rates, *Fertilizers, *Efficiencies, Linear programming, Mathematical models, Nitrogen, Nitrates, Agriculture, Costs, Illinois, Water quality standards, Pollution abatement.
Identifiers: *Environmental Pricing and Standards, Point-source pollutants, Dispersed-source pollutants.

The Environmental Pricing and Standards System (EPS), a corrective tax approach to managing environmental quality which avoids the problem of constructing the social damage function by not requiring fully Pareto efficient solutions, is applied to the problem of managing surface water nitrate pollution in agricultural regions. Regression analysis is used to relate nitrogen fertilizer use to nitrate concentration found in Illinois waters. These relationships enable the regional environmental nitrate-nitrogen standards to be translated into constrants on agricultural production. A mathematical programming model translates the environmental constraints and Illinois production alternatives into the national agricultural market. Cost minimizing production patterns and optimal nitrogen application rates are determined using linear programming techniques. Nitrogen use is constrained, and the optimal shadow prices on these constraints can be interpreted as the cor-

rective taxes on nitrogen fertilizer which are necessary to achieve specific environmental standards. The effect that application of the EPS approach would have on land use, production, prices and income are examined for both Illinois farmers and the nation. Results indicate that corrective taxes of 1-2 cents per pound would be needed to achieve the U.S. Public Health Service standard of 10 ppm. (Luedtke-Wisconsin).

STABILITY ANALYSIS OF AN EFFLUENT CHARGE AND THE 'POLLUTERS PAY' PRINCIPLE,
Louvain Univ. (Belgium).
H. Tulkens, and F. Schoumaker.
Journal of Public Economics, Vol. 4, No. 3, p. 245-269, 1975. 4 fig., 15 ref. NSF GS-3269-A2.

Descriptors: *Pollution taxes(Charges), Optimization, Effluents, Mathematical studies, Compensation, Pollution abatement.
Identifiers: Stability analysis, Pigovian taxes, Pareto optimum, Externalities.

Problems relating to the control of a detrimental externality affecting many agents through a Pigovian tax are considered. Under conditions of a pure exchange economy with two private commodities and one collective externality, a nontatonnement process is formulated which yields a rule for adjusting an effluent charge of the Pigovian type from the zero level at a laissez-faire equilibrium up to a Pareto optimum. Convergence, monotonous decrease of the externality along a continuous path of price equilibria, and the distributional implications of alternative redistribution schemes for the proceeds of the charge are analyzed. Various interpretations of the 'polluters pay' principle are also discussed in conjunction with property rights. The stability analysis methodology developed by Dreze, de la Vallee Poussin, and Malinvaud in recent literature on the theory of public goods is utilized with two variations: (1) The quality of public good is controlled by means of a price, the Pigovian tax, instead of being directly planned, and (2) the economy always remains within feasible states, along the process. The analysis is limited to the simplest case for reasons of expositional clarity, but possible extensions of the process are also briefly discussed. (Luedtke-Wisconsin).

ECONOMIC ANALYSIS OF EFFLUENT GUIDELINES FOR THE ASBESTOS INDUSTRY,
Little (Arthur D.), Inc., Cambridge, Mass.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-238 268, $5.50 in paper copy, $2.25 in microfiche. Report No. EPA-230/2-74-001, December 1974. 112 p. 19 fig., 26 tab., 27 append. 60-01-1541.

Descriptors: *Economic impact, *Water pollution control, *Mineral industry, *Asbestos, Prices, Industrial production, Employment, Foreign trade, Costs, Pollution abatement, Industrial wastes, Effluents, Legislation.
Identifiers: *Asbestos industry.

The potential economic impact of water pollution abatement requirements on the asbestos products manufacturing industry under the Federal Water Pollution Control Amendments Act of 1972 for three standards: (1) The best practicable control technology (BPT), (2) the best available control technology (BAT), and (3) the new source performance standards (NSPS), is evaluated. Broad economic effects including prices, continued viability of affected plants, employment, industry growth, and foreign trade are considered. Capital costs for the entire industry to meet the 1977 BPT standards are estimated to be $2,928,000 or less than 1.8% of the estimated annual sales of the asbestos products. This is not expected to be a major burden on the industry, though it is possible that three plants could be forced to shut down. BAT standard implementation would require a total capital expenditure of about $6,510,000, with one additional plant closing possible. Analysis of the impact of NSPS indicates that there would be no adverse effects on the growth of the industry due to the standards, that price structure and market competitiveness would not be significantly affected, and that these costs would not constitute a significant inducement for U.S. manufacturers to locate new facilities at foreign sites. (Luedtke-Wisconsin).

EVALUATION OF MILL TAILINGS DISPOSAL PRACTICES AND POTENTIAL DAM STABILITY PROBLEMS IN SOUTHWESTERN UNITED STATES, INVESTIGATION REPORT, PHELPS DODGE CORPORATION, MORENCI TAILINGS DAM, MORENCI, ARIZONA, VOLUME 2,
Wahler (W.A.) and Associates, Palo Alto, Calif.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-243 075, $7.50 in paper copy, $2.00 in microfiche. Bureau of Mines OFR 50(2)-75, December 1974. 172 p, 25 fig, 3 tab, 16 ref, 2 append. Bu Mines S0110520.

Descriptors: *Arizona, *Embankments, *Waste disposal, *Mining, Drill holes, Geologic control, Failures, Disposal, Research facilities Seismic properties, Engineering, Piezometers, Materials testing, Sampling, Testing procedures.
Identifiers: *Tailings, *Morenci(Ariz), Disposal practices, Field density, Failure conditions.

The Phelps Dodge Corporation's tailings embankments numbers 1 West and 2 West, at Morenci, Arizona, were studied. Pertinent factors relating to the physical features and operational characteristics of the facility were described. These included information on embankment construction practices and investigation of the general geologic and seismicity characteristics of the site and vicinity. Limited field exploration and sampling of materials was made at the site. Piezometers, surface movement markers, and slope indicator casings were installed and monitored on a limited basis. In the laboratory, tests were made of materials to evaluate the basic index and engineering properties of the embankment and tailings materials. Selected engineering analyses of the embankment for various types of potential 'failure' conditions were made. The report included two very detailed appendixes. EVALUATION OF MILL TAILINGS DISPOSAL PRACTICES AND POTENTIAL DAM STABILITY PROBLEMS IN SOUTHWESTERN UNITED STATES. INVESTIGATION REPORT, KENNECOTT COPPER CORPORATION, MAGNA TAILINGS DAM, MAGNA, UTAH. VOLUME 3,
Wahler (W.A.) and Associates, Palo Alto, Calif.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-243 076, $8.00 in paper copy, $2.25 in microfiche. Bureau of Mines OFR 50(3)-75, December 1974. 226 p, 22 fig, 3 tab, 21 ref, 3 append. Bu Mines S0110520.

Descriptors: *Embankments, *Utah, *Waste disposal, *Mining, Sites, Drilling, Disposal, Research facilities, Geologic control, Failures, Seismic properties, Engineering, Piezometers, Materials testing, Sampling, Testing procedures.
Identifiers: *Tailings, *Site geology, *Magna(Utah), Disposal system, Seismicity, Refuse disposal system, Field exploration.

The results of studies of Kennecott Copper Corporation's tailings embankment at Magna, Utah were described. Stability studies were performed on only one cross section of the embankment by utilizing data obtained from drilling, sampling, and testing, which was limited in nature. Data were collected to provide background information to support the overall research effort. It was not possible to evaluate the degree of safety or adequacy of the embankment disposal system. The Magna tailings deposit is located within the Basin and Range structural and physiographic province of western United States. The formation is moderately to complexly folded, with fold axes trending approximately in a north to northeast direction. The tailings deposit lies on partially indurated lake sediments of the Great Salt Lake and of the former Lake Bonneville, which consist mostly of clay with sand and gravel. The nearest known active fault is about 12 mi east of the tailings area. The report contained a discussion of site geology and seismicity, information on the refuse disposal system, pertinent characteristics of the tailings materials, a summary of engineering analyses, and a set of references. A MARGINAL COST BASIS FOR METROPOLITAN WATER SUPPLY ALLOCA-TION AND OPERATION,
Northwestern Univ., Evanston, Ill. Dept. of Civil
Engineering.
D. L. Hey.
Available from the National Technical Informa-
ion Service, Springfield, Va 22161, as PB-251 567,
7.50 in paper copy, $2.25 in microfiche. Ph.D.
Thesis, June 1974. 185 p, 17 fig, 14 tab, 49 ref, 4
ppend. OWRT B-059-ILL (5), 14-31-0001-3276.

Descriptors: *Water transfer, Regional analysis, Water demand, *Water supply, Operations, *Marginal costs, *Water distribution(Applied), Optimum development plans, Cost analysis, *Municipal water.
Identifiers: Geometric programming.

In most metropolitan areas, water is supplied to the general public through treatment plants, pumping stations, reservoirs or distribution networks. Allocation of production and transportation of these separate but adjacent supply systems is determined by the demand within a municipality. The excess capacity of one system could augment another system lacking capacity and thereby improve the use of treatment, transportation, and storage facilities of both systems. The problem is to minimize the cost of providing potable water, given a multiple-plant, regional water supply system. Optimal use of the regional systems is the main issue and not the expansion of the system. The relationships between costs of transportation, production and quantity of water were combined in an objective function that describes the variable cost of regional water supply. The transportation cost function was found to vary with the period of operation. Geometric programming was used to solve the non-linear equations describing the energy needs for transporting water. Since marginal cost analysis produces the most efficient ratio of outputs to given total demand, this knowledge can lead to better use of the existing capacity which could result in the delay or avoidance of additional capitalization. VIABILITY OF EXISTING WATER RESOURCE MODELS, THE POTOMAC RIVER BASIN WATER SUPPLY ALTERNATIVES,
Interstate Commission on the Potomac River Basin, Bethesda, Md.
Y. Gordon.
Journal of Hydrology, Vol. 28, No. 2/4, p 127-136, February 1976. 2 tab.

Descriptors: *River basins, *Water supply, *Alternative planning, *Potomac River, Hydrologic aspects, Topography, Water demand, Impounded waters, Groundwater, Imported water, Evaluation, Decision making, Mathematical models, District of Columbia.
Identifiers: Waste removal, Washington(DC), Estuarine water.

Considered are the topographic and hydrologic features of the Potomac River Basin, utilization of the River for water supply and waste removal, alternatives proposed for meeting future water demands (including impoundment, groundwater, estuarine water, and importation), and evaluation of the alternatives. The Potomac River Basin is often divided into upper and lower basins for water usage considerations. The most important factor in the supply of water to the Washington metropolitan area is that the greatest portion of the water is withdrawn from the actual flow of the river. Many of the factors that constrain our decision making as to the optimal solution to the water supply problem are not technical. Ecological and environmental considerations play a very important role in the choice of alternatives in any decision involving a change in existing environmental structure. Decision makers must establish a mathematical model which can include all the constraints and variables and test them. The present problem is how to define and analyze the growing concern of citizen groups and how to incorporate future discoveries into present planning. (Bell-Cornell)

Identifiers: *Mixed-integer programming, Cost minimization.

An important part of the water resource planning process involves the selection and scheduling of structural measures to optimize development objectives. The problem of selecting configurations of water resources projects and scheduling their construction has been discussed by a number of authors. This paper describes a water resources planning model that is also formulated as a mixed-integer program. A given geographic area is divided into planning regions within which regional water demands are assumed to be located at single points. For each planning period, the model determines the water supply projects to be built and the amount of water to be produced, treated, and imported or exported to meet future water demands at minimum present cost. Model constraints include a response function which relates groundwater withdrawals to aquifer recharge induced from stream segments forming boundaries of the aquifer. The use of this model in conjunction with

several water demand models used to evaluate the impact on nonstructural measures is also discussed in the context of water resources planning in the Commonwealth of Puerto Rico. (Bell-Cornell)

Identifiers: *Goal programming, *Multiple objectives, Integer programming, Environmental planning.

Economic and environmental quality objectives as proposed by the Water Resources Council are often conflicting. Goal programming, a variant of linear programming and integer programming is proposed as a technique for considering the multiple objectives in water resources project planning and selection. The method enables a comprehensive water resources model which considers both the economic and environmental objectives and may be implemented with data which are available to project planners. A COST ANALYSIS SYSTEM FOR PORTS,
Peruvian Port Organization, Callao.
A. Dover.
Dock and Harbour Authority, Vol. 56, No. 658, p. 118-123, 1975. 1 tab.

Descriptors: *Cost analysis, *South America, *Harbors, Ships, Management, Income, Tariff, Indirect costs, Direct costs, Facilities, Operating costs, Systems analysis, Equipment, Depreciation.
Identifiers: *Callao(Peru).

The accounting system used in the Port of Callao, Peru, based on costs per vessel, is described. The principal export cargoes are minerals and fishmeal; the imports are general break-bulk cargoes as well as bulk grain and petroleum products. The system used is based on the job control method used in the civil engineering industry and applied to evaluation of costs per vessel instead of costs per unit weight or volume of cargo. Cost analyses were computerized of direct operational, direct administrative, general administrative, infrastructure, main office, and reserve and investment fund costs. System flow charts are prepared to obtain stevedoring costs per vessel, tonnages loaded and discharged per vessel per month, tonnages received and dispatched by shed and open storage area per month, unit rates, quay labor, and revenue obtained for each vessel. Unit hourly rates are derived for handling equipment by establishing optimum life for each equipment category; annual equipment depreciation plus annual repairs and maintenance were determined and spread over total hours worked annually. Handling rates on a tonnage basis were established for each shed or open storage area on the basis of total cost for each reception and dispatch area divided by tonnages handled. AN EVALUATION OF COST-BENEFIT ANALYSIS CRITERIA,
Leeds Univ. (Scotland). Inst. for Transport Studies.
C. Nash, D. Pearce, and J. Stanley.
Scottish Journal of Political Economy, Vol. XXII, No. 2, p. 122-134, 1975. 31 ref.

Descriptors: *Cost-benefit analysis, *Measurement, *Ethics, Social aspects, Decision making, Evaluation, Equitable apportionment.

Certain premises in the field of cost-benefit analysis are questioned in order to show that the choice between them can only be made on moral rather than logical grounds. An attempt is made to clarify the moral notions underlying existing cost-benefit procedures, which are then related to specific ethical values. Although the logic of some of the arguments used to justify particular procedures are questioned, ultimately each procedure can be related to some set of moral notions, and thus the choice between methods is in the end an ethical one, based on value judgments. It is implied that cost-benefit analysis will be most useful if results are presented in a disaggregated format, such as that of Lichfield's Planning Balance Sheet (Lichfield 1968) with incidence of effects and methods of valuation clearly stated, which can then be adjusted to conform to specific equity no

ions, and thus reach an informed opinion of the esirability of the scheme. One of the difficulties he cost-benefit analysts face is an apparent in-ompatibility of their work with growing demands or public participation in planning. Often, cost-enefit analyses have been used to justify to the ublic decisions already taken, rather than to in-orm the public of the consequences of alternative ourses of action. (Auen-Wisconsin)

HE EVALUATION OF BENEFITS FROM ECREATIONAL PROJECTS,
Iull Univ. (England). Dept. of Economics.
. W. Vickerman.
/rban Studies, Vol. 11, No. 3, p. 277-288, 1975. 4 ib., 8 ref.

escriptors: *Recreation demand, *Benefits, Evaluation, Model studies, Elasticity of demand. lentifiers: England.

ome fundamental objections are raised to lawson's (1959) methodology for the appraisal of ecreational project benefits. The Clawson lethod uses trip length distribution functions and ombines the demand curve, identifies the eneficiaries, and evaluates benefits. However, he central problem in this approach is that the im-lied recreation demand function deals with only a ngle facility at a time. This assumes that in order o make a prediction for a new site the situation oncerning an existing site can be transferred rough time and space; no reference is made to he supply prices of substitutes. The 'product' efinition can best be done by reference to the lasticity of substitution. The suggested model ould first identify the effects of a new facility on ecreation to define the relevant area of analysis. he likely degree of substitution between activi-es must also be allowed for, and should involve he construction of indices to express revision in ecreation habits in the form of spatial potential. It hould also be considered that development of a ew site or recreation facility may indirectly enefit other sites by inducing substitution of an ctivity and growth in total demand while trans-ort improvements and other independent in-uences on mobility enable a wider varietY of tes to be visited. CONOMIC BENEFITS OF POTABLE WATER UPPLIES IN RURAL AREAS OF DEVELOP-NG COUNTRIES,
ent State Univ., Ohio. Dept of Economics.
. J. Saunders.
ournal American Water Works Association, Vol. 7, No. 6, p 314-317, 1975. 23 ref.

escriptors: *Foreign countries, *Rural areas, Water supply, *Benefits, Economic impact, So-al impact, Income distribution, Financing.
lentifiers: *Underdeveloped countries.

he problems of measuring benefits of potable ater supplies to rural villages in underdeveloped ountries are discussed. The concept that a pota-le water supply for villages of a developing ountry is necessary for economic growth is falli-le because the potable water supply alone is not fficient to stimulate economic development, ir-spective of any improved health benefits. If the ater supply system is designed to provide water r livestock, irrigation of small gardens, and is mplemented by health education, sanitation, eder roads, and marketing information the robability exists that a water supply program will ave an economic impact. The major administra-ve problems associated with providing piped ater to rural villages are due to the lack of incen-ve and expertise for operation and maintenance the systems. Factors that increase the potential successful performance of the administration nd financial aspects of such programs are con-ibutions of labor and money to help cover con-structions costs, user fees that at least cover operation and maintenance expenses, and that rural water supply programs are controlled by a national or regional agency. Investment in a water supply system in rural areas in Third World countries will generally result in income redistribution from higher-income urban to lower-income rural areas and urban slums. Journal of Environmental Economics and Management, Vol. 1, No. 3, p. 187-201, 1974. 1 fig., 7 tab., 11 ref., 1 append. FS Int-19-03(10).

Descriptors: *National recreation areas, *Carrying capacity, *Public lands, *Model studies, *Density, National parks, Management, Use rates, Attitudes, Behavior, Montana.
Identifiers: *Congestion, Wilderness recreation, Wildland areas, Primitive areas, Spanish Peaks(Mont).

The economic concept of 'carrying capacity', defined in terms of the maximum level of output of a constant quality available from a given resource, is the norm for measuring the attributes of primitive recreation areas in terms of solitude enjoyed during an outing. Solitude is defined as a recreation activity with members of a group of their choosing; intrusion upon solitude refers to interaction with others outside the group. The number and types of encounters with other parties were found to be useful proxies for the disruption of solitude and, as such, erode the quality of the recreation experience (i.e., impose congestion costs). These were used as criteria for a large scale simulation model to estimate these effects for a wilderness area. The model is parameterized to correspond to the 1970 recreational season conditions in the Spanish Peaks Primitive Area in Montana. In order to take account of the congestion externalities associated with increased use intensity during a given period, the model determines the effects of alternative use levels on the expected quality of each individual's experience. The simulation experiments were designed to examine the effects of total use and pattern of use on measured encounters as a guide to management decisions. (Auen-Wisconsin).

Descriptors: *Administration, *Water resources development, Comprehensive planning, Regional planning.
Identifiers: *Water authorities(G.B.)

Population increases, food production increase demands, industrial relocation, increased housing demands, more recreation, redistribution of wealth, and better communications all exert pressures on the newly-established Water Authorities in Great Britain to provide more water, main drainage, land drainage, and water-space amenities. The interplay between national, regional, and local resources is complicated. Already the regional Water Authorities must evaluate themselves and their relations with national and local contacts. Broader national policies and more cooperation between regions must be accepted. A composite management/structure type committee to assess the reorganized system and the two Royal Commission reports is recommended. In the development of the Water Authorities, important guidelines for future policies can be established. (Loustau-FIRL)

PUBLIC INVOLVEMENT IN THE CORPS OF ENGINEERS PLANNING PROCESS,
Institute for Water Resources (Army), Fort Belvoir, Va.
J. R. Hanchey.
IWR Research Report 75-R4, October 1975. 44 p, 49 ref, append.

Descriptors: *Water resources, *Planning, *Public participation, Management, Design, Decision making, Budgeting, Communication.
Identifiers: Public information programs.

This report discusses the design, implementation, and management of public involvement programs as integral parts of the Corps of Engineers water resources planning process. The approach to program development suggested relies on several key concepts: (1) planning should be viewed as consisting of several sequential stages, each of which has a definable output and therefore represents an implicit or explicit decision point; (2) public involvement programs can and should be approached on a stage-by-stage basis; (3) there should be public checkpoints at the end of each stage to provide the public and the reviewing elements of the Corps with citizen input as to the adequacy and responsiveness of the planning to date; (4) these public checkpoints are not in themselves adequate, but are only the culmination of active participation during each planning stage by limited segments of the public; and (5) decision making responsive to public concerns requires the explicit consideration of public input before key decisions are made at each state. The report includes chapters on developing public involvement programs, forums for obtaining citizen input, guidelines for developing public information programs, monitoring and evaluation of programs, and staff organization and budgeting for public involvement activities. A STUDY TO ASSESS GOALS FOR USES AND MANAGEMENT OF SHORELINE AND IMPLICATIONS FOR CORPS OF ENGINEERS PROGRAMS.
Coastal Zone Resources Corp. Wilmington, N. C.
IWR Contract Report 75-4, U. S. Army Corps of Engineers, Institute for Water Resources, Fort Belvoir, Virginia, July 1975. 101 p, 4 fig, 3 tab, 49 ref. DACW-31-75-C-0017

Descriptors: *Coasts, *Management, *Assessment, Shore protection, Legislation, Governments, Beach erosion, Control, Programs.
Identifiers: *Coastal zone management.

A high level of activity relating to use and management of shorelines and the coastal zone is in evidence. This study is an assessment of the significance of legislation, policies and actions affecting the coastal zone at all levels of government. The assessed activities are interpreted for their significance to Corps of Engineer programs in

shore protection. The study concludes that the state assert their authority for the coastal zone management function and the Federal agencies should help identify and perform activities complimentary to state programs. Further, the Corps is advised to formulize its technical support relationships with State Coastal Zone agencies, develop and prepare educational materials to assist in coastal zone problems, expand research in coastal problems and explain remote sensing technology. WATER PLAN RANKING AND THE PUBLIC INTEREST,
Stanford Univ., Calif. Dept. of Civil Engineering.
L. Ortolano.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Proceedings paper No. 12068. Vol. 102, No. WR1, p 35-48, April, 1976. 2 fig, 25 ref.

Descriptors: *Water resoures, *Planning, *Environmental effects, *Social participation, Economic efficiency, Equations, Water law.
Identifiers: Multiple objectives, Weighted sum of objectives technique, Weighted sum of factors technique, Federal laws.

The 'public interest,' which often serves as the basis for ranking alternative Federal water resources plans, is defined in terms of the following: What factors should be considered and how should the factors be weighed relative to one another in ranking proposals. Answers to these questions provide the framework for an analysis of several approaches that have been used in ranking alternatives (e.g., economic efficiency, weighted sum of objectives). In the course of examining these approaches, an argument is made in support of trends toward the direct involvement of citizens in the determination of factors and weights. The approaches examined, as they are commonly employed in practice, are shown to be less than satisfactory in terms of involving citizens in determining factors and weights. A process is outlined which integrates public involvement activities into the ranking of alternatives and which has been found useful in the context of Corps of Engineers' water resources studies. Identifiers: Applied research, Basic research, Information systems, Quality.

Development of a plan for a water research program is no simple task. The manager must resolve a number of problems which, although not unique, are complicated because of the nature of the scientific enterprise. Among the problems are the balance between basic and applied research, criteria for project selection, difficulties of crash programs, staffing, establishing priorities, and control of duplication of efforts. An effective program must plan not only for the actual research effort, but must include consideration for dissemination and implementation of the results. This means that practitioners must be included in the continuing planning effort. Furthermore, the interaction between practitioners and scientists will assist in insuring that the results will be in a form that will be useable. The researchers should then be used by the funding organization to be sure that the results are understood and properly implemented. (Bell-Cornell)

Descriptors: *Water quality, *Decision making, Information exchange, *Evaluation, Surveys, *Social values, *Planning, Arizona, New Mexico, Psychological aspects, Rio Grande River, Attitudes, *Social needs.
Identifiers: *Multiple-objective planning, *Strawman project, *Rio Grande Valley(N Mex), *Information systems.

The purpose is to develop an information system to input public values into the planning and evaluation process. A hierarchy of goals is developed and disaggregated until terms meaningful to the general public and describing the state of the world can be input to the disaggregation. The disaggregation of community goals may provide a means of linking the technical criteria of the professional and the values and goals of the general public. Conventional scaling techniques of ranking and rating are discussed and compared with a general allocation technique and other psychological scaling methods to estimate the parameters of a function for quantifying perceived satisfaction. The general allocation technique, used in a mail survey, shows promise as a means of recovering community preferences. A power function is tested against the satisfaction ratings given to samples of water of varying clarity. The general allocation technique was used to recover the parameters of the quantifying function. It was then applied to determine the goal and sub-goal preferences of subjects in Arizona and the Rio Grande Valley of New Mexico. (See also W76-01110)

REORIENTATION OF URBAN WATER RESOURCES RESEARCH, FINAL REPORT,
Rutger-The State Univ., New Brunswick, N.J. Water Resources Research Inst.
W. Whipple, Jr., M. M. Hufschmidt, B. B. Berger, D. H. Howells, and L.D. James.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-251 907 $4.50 in paper copy, $2.25 in microfiche. Proceedings of a Workshop, published by Water Resources Research Institute, Rutgers University, February 1976, 52 p. OWRT B-062-NJ(1) 14-31-0001-5134

Descriptors: *Water quality control, Management, *Institutions, *Research priorities, *Cities, *Urbanization, *Research and development, Urban runoff, Land management, Water quality, Technology, *Urban hydrology, Flood plains.
Identifiers: *Research policy, *Urban-related water resources research, *Water-land interfaces, Urban water quality, Urban flood plain management.

This is a report of a workshop held at Quail Roost, N.C. and of final conclusions by editing and steering committee, to develop an improved program of water resources research related primarily to problems in urban and urbanizing areas. The workshop participants were widely representative of different disciplines, different regions, and of agencies and professional consultants as well as the academic community. The consensus was that the Federal approach to water resources has generally neglected the problems of metropolitan areas. Hydrological, water quality and ecological data are insufficient, technology to meet many problems is lacking, and existing institutions are ill adapted to the problems now being encountered. Particular emphasis in urban-related research needs to be given to fields of water quality, flood plain management, and interfaces with land-use planning and control. Strategies and basic objectives should be re-examined as well as the problems of planning to meet environmental objectives at reasonable cost. Programs of urban-related water resources research are recommended.

REORIENTATION OF URBAN WATER RESOURCES RESEARCH, EXECUTIVE SUMMARY,
Rutger-The State Univ., New Brunswick, N.J. Water Resources Research Inst.
W. Whipple, Jr., M. M. Hufschmidt,, B. B. Berger,, L. D. James, and B. B. Howells.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-251 908, $3,50 in paper copy, $2.25 in microfiche. Proceedings of a Workshop, published by Water Resources Research Institute, Rutgers University, March 1976, 15 p. OWRT-B-062-NJ(1). 14-31-0001-5134

Descriptors: *Water quality control, Management, *Institutions, *Research priorities, *Cities, *Urbanization, *Research and development, Urban runoff, Land management, Water quality, Technology, *Urban hydrology, Flood plains.
Identifiers: *Research policy, *Urban-related water resources research, *Water-land interfaces, Urban water quality, Urban flood plain management.

This is an abbreviated report of the findings of a workshop sponsored by the Universities Council on Water Resources and the Urban Water Resources Research Council of the American

Society of Civil Engineers, and held at Quail Roost, N.C. in July 1975. Recommendations for urban-related research related to water quality propose development of strategy and methodology to contribute to remedying the various deficiences, including those in the basic planning goals and approaches, better methods of measuring and evaluating pollution from urban runoff, methods of determining the environmental effects of pollution, alternative water quality enhancement approaches (other than effluent treatment), and a better institutional framework for areawide planning. There is no unified national policy for flood plain management. Goals of economic efficiency, of avoidance of social disruption, of financial aid after a disaster, and of better land use of flood plains are expressed implicitly in various Federal programs; but they need analysis and interpretation in relevant and consistent terms. Much state legislation needs modernization to keep pace with new developments.

ANNUAL REPORT 1974.
Lehigh-Northampton Counties Joint Planning Commission, Lehigh Valley, Pa.
September 1975. 27 p, 10 fig, 3 tab.

Descriptors: *Regional development, *Planning, Regions, Local governments, *Environmental effects, *Water supply, *Sewage treatment, Recreation, Employment, Storm damage, *Pennsylvania.
Identifiers: Lehigh County(PA), Northampton County(PA), Housing, Policy analysis, Citizen participation.

This report covers major issues and policies of important areas: regional growth, human resources and community service, housing, recreation, environmental protection and transportation. In response to citizen questions the introduction discusses why planning takes so much time and why it may seem that plans are not implemented. It is argued that plans are being implemented but over a long period and that plans must change periodically to reflect new conditions. In 1974 the Joint Planning Commission completed the draft of the Regional Storm Drainage Plan which documents existing problems, analyzes future trends and recommends solutions for problems in individual drainage basins throughout the region. Procedures for planning of private and public water systems were examined. A study of the public water systems in the western part of the county was initiated. Major problems exist regarding future sewage treatment plan capacity. Allentown needs to expand the plant at Kline's Island and has applied for federal funding. Construction of a sewer interceptor relief line in the western part of the county is needed. Water quality in some portions of the region is too poor to provide a safe water supply or support aquatic life. Lehigh County needs to develop a long range water supply. Proliferation of private water companies may hinder development of a regional water supply plan because it may not be economically feasible to serve fragmented leftover areas with public water. Public sewers need to be extended in urbanizing areas since developers continue to pressure for building of packaged treatment plants beyond present sewer extensions. (Smith - North Carolina)

PARETO OPTIMALITY, PURE PUBLIC GOODS, IMPURE PUBLIC GOODS AND MULTIREGIONAL SPILLOVERS,
Arizona State Univ., Tempe.
T. Sandler.
Scottish Journal of Political Economy, Vol. 22, No. 1, p. 25-38, 1975. 2 fig., 26 ref.

Descriptors: *Economic efficiency, *Governmental interrelations, *Welfare(Economics), Benefits, Optimization, Governments, Mathematical models, Planning.
Identifiers: *Public goods, *Pareto optimality, International cooperation, Spillovers, Multiregional, Interregional, Congestion.

Factors involved in multiregion or multicountry sharing of public goods exemplified by common market arrangements, military alliances and congestion are examined, with particular attention to the issues of an economic theory of optimal group size when impure public goods are shared between regions, and trade-offs among interregional public goods. First, the recent literature, particularly that on impure public goods and on optimal provision of public goods by local governments, is integrated in order to derive the efficiency conditions in a number of diverse situations. Pareto-optimal ratios are stated for a number of cases, including: (a) that in which any number of participating regions and multiple public goods are producing interregional spillovers of benefits, (b) the situation in which a good is impurely public both within and between regions due to congestion costs. User fees and their role in financing an optimal quantity of the public good are also discussed. Secondly, an analysis of the behavioral assumption regarding cooperation indicates that the independent adjustment equilibrium and the Pareto-optimal equilibrium serve as bounds to the cooperative equilibrium. LAKE LOCATION AND QUALITY AS DETERMINANTS OF POTENTIAL RECREATION BENEFITS: A STUDY OF SELECTED LAKES IN MANITOBA,
Manitoba Univ., Winnipeg, Dept. of Agricultural Economics and Farm Management.
R. E. Capel, and C. B. Ross.
In: Proceedings Symposium on the Lakes of Western Canada, June 1973, Water Resources Center and the Dept. of Extension, Univ. of Alberta, Edmonton, p. 114-144. 1 fig., 12 tab., 28 ref., 3 append.

Descriptors: *Sites, *Recreation demand, *Use rates, *Benefits, *Forecasting, Lakes, *Canada, Regional development, Model studies, Estimating, Recreation facilities, Competing uses, Indicators, Data collections, Aesthetics, Regression analysis, Alternate planning, Decision making.
Identifiers: *Manitoba, Recreation quality indices.

A method is proposed to help lake developers choose the plan which will provide maximum benefits. Recreational demand is considered regionally, rather than individually for each lake development project. A model developed to describe visitation by city residents to recreation areas, considers population, site location and quality, and competition between sites. Visitation patterns of Winnipeg and southwest Manitoba residents were studied. Recreational area quality indices based on presence of beaches, fishing, docks, and ramps were determined for 61 areas with various water resource qualities. The model indicated that number of visitor days spent in a recreation area per year by town residents per capita of that town's population was a function of distance from town to area and of the recreational area quality index. Data was obtained by mail questionnaires and park gate traffic counts. The model can project visitation to actual or hypothetical parks. Using travel cost techniques, demand curves can project benefits for benefit cost analysis of alternative plans. It provides a framework for planning and study of development proposals, and indicates future research needs. Lake quality indices, relationships between adjacent areas, and effects of number of recreational areas on total visitation are variables to be considered. (Buchanan-Davidson--Wisconsin).

COST-BENEFIT RULES IN GENERAL EQUILIBRIUM,
Queen's Univ., Kingston (Ontario).
R. W. Broadway.
Review of Economic Studies, Vol. 67 (3), No. 131, p. 361-374, 1975. 1 fig., 17 ref.

Descriptors: *Economic efficiency, *Model studies, *Government finance, Cost-benefit analysis, Taxes, Cost allocation, Mathematical models, Welfare(Economics), Prices, Marginal costs.
Identifiers: Shadow prices.

The question of what rules the government should use to evaluate efficiency gains from public sector projects in a tax-distorted economy is considered. A simple general equilibrium model is employed to illustrate relationships among a variety of propositions which have appeared in the recent literature on applied welfare economics. Three cases are examined in some detail: (1) The Hotelling-Harberger-Lesourne proposition that in order to measure welfare changes due to government policy changes such as taxes, it is necessary to look at changes induced in the allocation of all goods and factors which are sold at distorted prices, (2) the Harberger proposition that when the government undertakes a project which directly involves the use of goods or factors purchased or sold on distorted markets, it ought to account for the distortions by using a shadow price or weighted average of the demand and supply prices for the good or factor, and (3) the Diamond-Mirrlees proposition that under certain conditions, when the government sets all taxes optimally, it should

use private sector producer prices as shadow prices in the public sector in order to achieve overall production efficiency in the economy. A more general cost-benefit rule which incorporates these special cases is also developed. (Luedtke-Wisconsin).

WISCONSIN RECREATIONAL HARBOR FACILITIES ALONG LAKE MICHIGAN,
Wisconsin Univ., Parkside, Dept. of Earth Science.
L. C. Ruedisili.
Report August 1974. 45 p.

Descriptors: *Lake Michigan, *Recreation facilities, *Boating, Harbors, Docks, *Wisconsin, Marinas, Surveys, Maintenance costs.

Thirty-six small craft marinas and yacht clubs located along the western shore of Lake Michigan in Wisconsin were surveyed in detail. The facilities were located between the Wisconsin-Michigan border on the north and the Wisconsin-Illinois border to the south. Although the survey is not complete, it is believed to include all of the major facilities available to recreational boaters on Lake Michigan. The name, address, phone number and manager or commodore of each facility is listed. The services which are available to the recreational boater at each facility are shown, including gasoline and oil, telephone, water, electricity, ice and supplies, restroom facilities, shower facilities, dock attendant, marine repairs, haul-out facilities, U.S. Coast Guard, launching ramp, holding tank pump-out, UHF-FM marine radio and mooring accomodations. Comments describe the design and management of each facility and estimated annual maintenance costs of each facility. (Buchanan-Davidson--Wisconsin).

A SOCIO-ECONOMIC EVALUATION OF ALTERNATIVE WATER MANAGEMENT POLICIES ON THE RIO GRANDE IN NEW MEXICO,
New Mexico State Univ., University Park. Dept. of Agricultural Economics and Agricultural Business.
R. R. Landsford, S. Ben-David, and T. G. Gebhard, Jr.
Natural Resources Jour, Vol. 15 p. 307-325 (1975). 19 p, 1 fig, 4 tab, 14 ref. OWRT A-045-NMEX(8).

Descriptors: *Surface waters, *Rio Grande River, *New Mexico, *Groundwater, *Economic impact, Regulation, Economic prediction, Econometrics, Planning, Productivity, Industrial production, Employment, Human resources, Statistical models, Statistical methods, Linear programming, Optimization, Water resources, Water supply, Water utilization, Water law, Riparian waters, Irrigation, Farming, Water rights.

Three alternative water management policies have been proposed for the Rio Grande river. They are: (1) no water constraint; (2) surface-water constraint; and (3) both surface water and groundwater constraints. A socio-economic model was developed to project future water use patterns and economic development under the alternative assumptions. This model was essentially a linear programming model designed to represent the New Mexico economy with special emphasis on the Rio Grande region. The model showed that without a water constraint, both regional production and water depletion were expected to exhibit the largest increase. When a surface water constraint was added the value of production decreased significantly. This decrease was even greater when both surface water and groundwater constraints were added. The added constraints, however, also drastically reduced water depletion. Such reduced depltion would be necessary for the region to support anticipated population increases in the twenty-first century. (Nursey-Florida)

COSTS IN RELATION TO CHARGES AT UK COMMON-USER BERTHS,
Deep Water Terminal Ltd. (England).
A. B. Reid, and H. K. Dally.
Dock and Harbour Authority, Vol. 56, No. 658, p. 127-130, 1975. 1 fig., 5 tab., 2 ref.

Descriptors: *Harbors, *Costs, *Transportation, Facilities, Cost analysis, Europe, Operating costs, Fixed costs, Unit costs, Inflation(Economic), Port authorities.
Identifiers: *England, Common-user Berths, Container berths, Docks.

Current container-handling charges of deep-sea container berths at major United Kingdom and North European ports are examined. The annual operating cost is composed of fixed (quay works, dredging, and a proportion of infrastructure and common assets) and variable (handling equipment, maintenance, dock labor, and power) costs. There must be a basic minimum of equipment, maintenance, and manning in order to provide satisfactory service. Because the basic fixed costs of operating a container berth are high, the unit cost per container handling is highly sensitive to annual throughput. Inflation has greatly affected costs. Costs should not be so high they discourage potential clients or so low it would be difficult to break even. Present British charges do not even cover operation costs and there has been a marked reduction in general cargo handling revenue. British ports are undercharging each container they handle at common-user berths from 14.50-29 pounds sterling, so that an average berth which commenced operation in 1972 would lose about 800,000 pounds in 1975. European ports generally charge more. It is concluded that higher British handling charges would not alter their competitive position with European ports. Ports should reflect the real cost of operating container berths in their charges. (Buchanan-Davidson--Wisconsin).

PRE-INVESTMENT IN PORT FACILITIES,
Liverpool Univ. (England). Marine Transport Centre.
M. Whittington.
Dock and Harbour Authority, Vol. 56, No. 658, p. 131-134, 1975.

Descriptors: *Investment, *Economics, *Harbors, Engineering structures, Costs, Construction costs, Transportation, Ships, Economic feasibility, Facilities.
Identifiers: *Port facilities.

Relationships between port sector engineering costs and marine sector costs are considered so that investment decisions can be based on the entire transport picture. Cost components of bulk transport systems are ships time, port, inventory, and inland transport costs. With bulk liquid transport (such as oil) time in port and cost of suitable berths are not important factors, but the cost and availability of water of sufficient depth and area are primary constraints on vessel size. With dry bulk vessels, length of time in port increases with vessel size, and infrastructure cost rather than cost of the berth determines the optimum facility size. With conventional and containerized general cargo, costs per ton of cargo for berth are small compared to other port costs (labor and marine sector costs). Costs of providing water, space, and communications are most important in determining economic feasibilities of new port facilities. Suitable water depths determine bulk cargo project sizes, while handling speeds are important for general cargo systems. Water depths and back-up areas are important for containerized general cargo. Costs of providing port infrastructure (inland transport facilities and sheltered water of sufficient depth) are generally more important than costs associated with increased depth and berth load bearing strength. ESTIMATING INDIRECT COST OF URBAN WATER USE,
Koebig and Koebig, Inc., Los Angeles, Calif.
C. H. Lawrence.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 101, No. EE 4, p. 517-533, 1975. 3 fig., 4 tab., 21 ref.

Descriptors: *Impaired water quality, *Water users, *Indirect costs, *Municipal water, California, Hardness(Water), Dissolved solids, Corrosion, Damages, Water works, Equipment, Industrial water, Water softening, Economic impact, Estimated costs, Mineral water.
Identifiers: Southern California.

Correlated composites of earlier quality related cost effects studies are presented in graph form as a means of approximating the economic impact of water mineral quality on urban water consumers. Specifically, indirect costs of urban water use are estimated for the Los Angeles River Basin 4B. Water mineral quality is reflected by total dissolved solids (TDS), and the impact of water hardness on the deterioration of domestic plumbing, domestic water heaters, municipal water works equipment, industrial water treatment and all domestic and commercial measures taken to contend with total hardness, are quantified. Total impact cost curves are developed for a complete range of dissolved solids and hardness. Unit costs are presented on an overall municipal basis. The slope of the total impact cost curve, i.e., the penalty cost, is expressed in dollars/acre-foot per mg/l TDS. For the 1974 conditions believed to prevail within the highly urbanized coastal plain area of Basin 4B, the penalty cost was estimated to range between about $25/acre foot (2.0 cents/ cu m) per 100 mg/l TDS at the low TDS range and about $35/acre ft (2.8 cents/cu m) per 100 mg/l TDS at the high TDS range. A NOTE ON UNCERTAINTY AND THE EVALUATION OF PUBLIC INVESTMENT DECISIONS,
State Univ. of New York at Stony Brook. Dept. of Economics.
E. James.
American Economic Review, Vol. 65, No. 1, p. 200-205, 1975. 3 fig., 4 ref.

Descriptors: *Risks, *Project feasibility, Government finance, Investment, Decision making, Dispersion, Economies of scale.
Identifiers: Scale effect, Dispersion effect.

The controversy over the optimal handling of risk by the government between those who advocate that the government should base its decisions on prices prevailing in the market and those who argue that the appropriate social risk premium is lower than the private is considered. Whether government investment projects should be evaluated individually or as a group is examined in the context of this controversy. The Arrow-Lind argument for a low social risk premium arises from a scale effect, while the risk pooling argument arises from a dispersion effect. It is shown that the effect on dispersion of risk pooling may lead the government to accept a group of projects which were individually rejected, while the scale effect may lead the government to reject a group of projects which were accepted individually. Thus the risk spreading, scale effect, should dominate in the evaluation of individual projects and the risk pooling, dispersion effect, should dominate in the group evaluation. This theme is developed using diagrammatic techniques. The necessary and sufficient assumptions for the Arrow-Lind finding that if the time-state preference approach is used, the value of an investment to the individual depends only on its expected return, are also investigated. (Luedtke-Wisconsin).

EXTERNALITIES AND COASE THEOREM: A GRAPHICAL ANALYSIS,
A. Gifford.
Quarterly Review of Economics and Business, Vol. 14, No. 4, p. 7-21, 1974. 11 fig., 12 ref.

Descriptors: *Resource allocation, *Industrial production, *Optimization, Damages, Compensation, Indirect costs, Marginal costs, Taxes.
Identifiers: *Externalities, *Coase theorem, Pigovian taxation, Nonconvexities, Transaction costs, Property rights.

A graphical analysis, which reaffirms the validity of the Coase theorem by demonstrating that differing assignments of property rights in externality situations do not lead to different resource allocations or to a breakdown in the optimal property of competition when transaction costs are zero, is developed. Allocation of rights distributes initial wealth, but has no effect on the final, socially optimal outcome. The graphic technique is also used to show that if a Pigovian tax is imposed to correct an externality situation where transaction costs are sufficiently low, the firms will be induced to bargain away from the socially optimal level of output which the taxation was originally designed to produce. The impact of taxing on resource allocation in the presence of low transaction costs is the opposite of that caused by the initial externality. Finally, it is demonstrated that problems arising from nonconvexities in the firms' cost or profit functions will not cause the resource allocation efficiency part of the Coase theorem to break down. AN ECONOMIC ANALYSIS OF GEORGIA'S MARINE CHARTER BOAT FISHING INDUSTRY,
Georgia Univ., Athens. Dept. of Agricultural Economics.
E. E. Brown, and F. J. Holemo.
Marine Fisheries Review, Vol. 37, No. 4, p. 11-12, 1975. 2 tab., 7 ref.

Descriptors: *Recreation, *Marine fisheries, *Return(Monetary), *Sport fishing, Boats, *Georgia, Economic impact, Indirect benefits.
Identifiers: *Charter boats, Party boats.

Based on the economic impact of the charter boat fishing industry in California, it is projected that this industry has growth potential in Georgia. A comparison of California's sport and commercial fishing industries indicates that sport fishing contributes more to California's economy than commercial fishing, i.e., $100-$200 million for sport fishing as opposed to $45 million for commercial fishing. The secondary income effects of sport fishing, between $300-$400 million, exceed the $200-$300 million generated by commercial fishing. The food value of marine fish caught by sport fishermen is estimated to be nearly two-thirds of the commercial catch. The amount of money spent in marine recreational fishing is far in excess of the dollar value of the fish caught. The current average income of charter boat operators in Georgia is $5108 annually, but the three most profitable charter boat operators expect yearly average net returns to total $26,374. Fifteen of the 17 Georgia operators did not rely upon the charter income for their entire living. The break-even costs, based on 812 charter hours, were $17 per hour, but this cost is reduced with increased hours of operation; the most profitable operators averaged 1241 hours annually resulting in a break-even cost of $11 per hour. RATES MUST BE FAIR,
Black, Crow and Eidsness, Gainesville, Fla.
J. D. MacGregor.
Water and Wastes Engineering, Vol. 12, No. 5, p. 31-34, 1975. 1 fig., 8 tab.

Descriptors: *Water rates, *Equity, *Water costs, *Utilities, Cost allocation, Water utilization, *Florida.

Rate structures must develop sufficient revenues to provide for operation, maintenance, and capital investment and at the same time must distribute cost equitably to all customers in relation to the benefits they derive or expenses they cause. The base extra-capacity rate determination method divides total cost (operating and capital) into costs which vary with amount of water produced, number of customers served, and water consumption rate. Extra-capacity costs are subdivided into costs of providing maximum day and maximum hour requirements. Block meter systems afford a lower unit cost for increased consumption and related costs to total consumption, but not to rate of water consumption. A rate structure method used in Florida is presented. Customers are classified as residential, apartments, or commercial and a peak consumption ratio determined and use for the determining peak hour costs. Contributions of each new customer type to operating and capital expenses are adjusted for expanded plant capacity. A deposit of connection fee funds could offset bond parity requirements, earn the cost of capital, and supply the difference between the per thousand gallon capital cost requirement during bond indenture. This plan reflects equitable cost distribution but requires careful cash flow management. (Buchanan-Davidson--Wisconsin).

METER REPLACEMENT PROGRAM PAYS FOR ITSELF,
Mankato Water and Sanitation Dept., Minn.
W. V. Lacina.
Water and Sewage Works, Vol. 121, No. 11, p. 73-76, 1974.

Descriptors: *Water works, *Instrumentation, Domestic water, *Minnesota, Automation, Replacement costs, Maintenance costs, Cost-benefit analysis.
Identifiers: Mankato(Minn), Remote registers.

Because customer billings for water consumption accounted for only 68% of water actually pumped, the City of Mankato, Minnesota, decided to replace all 6700 residential meters in its distribution system. Analysis showed that it would cost about $70,000 more to modernize and repair existing equipment than to replace all meters with new plastic Recordall meters and Read-o-Matic outdoor registers. In 1972 mechanical drive units were replaced with plastic meters and outdoor registers installed. Benefits were multiplied because sewer user fees are based on metered consumption of water. Water revenue increases after meter modernization amounted to $272,351 for 1972-1973. Total outlay was $204,077, leaving a $68,000 surplus. Since meter replacement costs were shared by the water and sanitation sections, the surplus was approximately $170,000. Remote outdoor registers have eliminated meter reading delays. It is anticipated that in time the meters can be read by signals transmitted to a central computer over telephone lines; field trials are in progress to evaluate the feasibility of this approach. SOME PROBLEMS IN ESTIMATING THE DEMAND FOR OUTDOOR RECREATION,
Rhode Island Univ., Kingston. Dept. of Resource Economics.
K. E. McConnell.
American Journal of Agricultural Economics, Vol. 57, No. 2, p. 330-334, 1975. 9 ref.

Descriptors: *Recreation demand, *Evaluation, Econometrics, Measurement, Income, Travel time, Time, Use rates.

Outdoor recreation demand functions are used to make inferences about the consumers' surplus and the social welfare derived from particular sites. Therefore empirical research should be as consistent as is feasible with the theoretical structure from which the consumers' surplus is derived. Practical difficulties implied by the assumptions of utility maximization are shown. The econometric structure of a demand model must be specified so that the price coefficient may vary as income varies, thus permitting analysts to determine which demand functions are not consistent with utility maximization. An analysis of the demand for outdoor recreation in a utility maximization framework in order to analyze empirical issues of research in outdoor recreation economics is developed. The value of total time consumed by the recreation activity rather than just the time in transit is the appropriate time variable in the demand for outdoor recreation. The trip or visit, not user-days, is the unit of measurement consistent with the travel cost method. There is a priori reason to specify the demand function so that the price slope can change as income changes. (Buchanan-Davidson--Wisconsin).

INSTITUTIONAL RATIONING OF CANAL WATER IN NORTHERN INDIA: CONFLICT BETWEEN TRADITIONAL PATTERNS AND MODERN NEEDS,
California Univ., Davis. Dept. of Agricultural Economics; and California Univ., Davis. Dept. of Water Science and Engineering.
R. B. Reidinger.
Economic Development and Cultural Change, Vol. 23, No. 1, p. 79-104, 1974. 2 fig., 5 tab., 25 ref.

Descriptors: *Irrigation canals, *Rationing(Water), *Water allocation(Policy), Channels, Reservoirs, Water supply, Farm units, Water users, Water utilization, Irrigation programs, Equitable apportionment, Irrigation systems.
Identifiers: *India, Bhakra canals(India).

Examination of the water rationing system used in the Hissar district of the Bhakra canals in north India showed that water rationing occurs at three levels: water available in the reservoir; rotation among channels; and at the farm with rotation of turns among farmers served by the same watercourse. Institutional or administrative decision rules and schedules rather than market forces govern canal-water rationing. Rationing at the various levels and the relative water scarcity cause uncertainty in the farmers' water supply and may explain the poor performance of many canal irrigation projects with respect to yields, profits, and use of irrigation potential. Competition between electricity and irrigation and interaction between canal and farm rotations are the primary causes of uncertain water supplies. The nonmarket nature of the rationing system and its lack of flexibility and controllability preclude compensating adjustments. To meet the needs of modern agriculture and to increase the predictability, certainty, and control of canal-water supply, capacity factors should be more closely matched to crop water needs. More equal sharing of water between small farmers and increase in supply predictability is needed. A water users' association to determine distribution is a possible method for providing more flexibility and control in farm-water supply. (Buchanan-Davidson--Wisconsin).

THE NATURE AND EXTENT OF RIGHTS IN WATER IN NORTH DAKOTA,
R. E. Beck, and J. C. Hart.
North Dakota Law Review, Vol. 51, No. 2, p. 249-314 (1974). 66 p, 335 ref. OWRT A-035-NDAK(2).

Descriptors: *North Dakota, *Water rights, *Water law, Prescriptive rights, Prior appropriation, Relative rights, Riparian rights, Governments, Judicial decisions, Legislation, Public rights, Legal aspects, Competing uses, Federal-State water rights conflicts, Jurisdiction, Regulation, Riparian waters, Usufructuary right, Governmental interrelations.

This article discusses in depth the competing ownership and control interests in the water within North Dakota. The North Dakota Code states that ownership of the water within North Dakota is in the public. The authors state, however, that this provision can only be interpreted in light of the following considerations: private riparian and prescriptive rights and rights of appropriation under North Dakota statutes; ownership rights which may exist in the Federal government and Indian tribes; federal control over the use of water; Canadian claims to international streams; claims of other states to interstate bodies of water. The article also points out problems related to each of the claims analyzed. The authors state that many of these problems could be resolved through rule making by the State Engineer or the State Water Commission, and if they fail to act, by the North Dakota Legislature. The authors also offer suggestions to aid in the resolution of many conflicting problems. (Nursey-Florida)

CONTROL OF ABSTRACTION BY LAW,
F. C. C. Hodges.
Journal of Hydrology, Vol. 28, No. 2/4, p 137-153, February 1976. 6 ref.

Descriptors: *Water resources development, *Conservation, *Water law, *Water rights, Water utilization, Control, Surface waters, Aquifers, Riparian rights, Rivers, Flow, Irrigation, Water pollution.
Identifiers: Water abstraction.

The conservation and development of water resources involves control by law of any abstraction of water. The law of a country relating to its water rights must play a major part where development is concerned, particularly in arid and semiarid countries. This paper considers various facets of major water use in general terms and considers ancillary problems connected with those abstractions, with some views and recommendations as to possible methods to be considered and actions to be taken to control legally these varying uses. Discussed are systems of laws relating to both abstraction from surfaced sources and underground aquifers (including Common Law, appropriation, combined Common Law - Riparian/Appropriation, full state ownership, and state ownership combined with minor private ownership), comparison between systems, definition of constituents of a water source in respect of water rights, underground sources, and interrelationship between underground aquifer-surface flow. Considered also are ownership of land married to a water source, determination of water rights, irrigation and development areas, over-extractionanticipatory legislation, registration and licencing, water pollution, leakage to potable sources, and land fragmentation and porposed consolidation schemes. DECISIONS FOR DELAWARE: SEA GRANT LOOKS AT LEGAL ASPECTS OF OCS DEVELOPMENT,
Delaware Univ., Newark. Center for the Study of Marine Policy.
G. J. Mangone, and J. Homer.
Decisions for Delaware, Marine Advisory Services, University of Delaware Sea Grant Program (Oct. 1975). 25 p, 1 map, 4 photo, 3 dwg, 2 chart.

Descriptors: *Delaware, *Continental shelf, *Ownership of beds, *Harbors, *Oceans, Beds, Waste disposal, Federal jurisdiction, Oil, Natural gas, Natural resources, Environmental effects, Permits, Water pollution control, Public health, Penalties(Legal), Legislation.
Identifiers: *Deep water ports, *Deepwater Port Act.

Recent legislation and litigation has had a significant impact on the uses of the United States outer continental shelf (OCS) including the exploration of petroleum, the development of deep water ports, and the use of the shelf as a dumping site. Because of a Supreme Court ruling that the United States has title to the ocean seabed outside of three miles from shore, the Department of the Interior will start leasing offshore lands for oil and gas development. While these leases are considered critical in spurring domestic development, several potential problems are foreseen concerning unrealistic production goals, the elimination of competition, and environmental concerns. Problems are also foreseen concerning the construction of deepwater ports authorized by the Deepwater Port Act of 1974. Many of these problems, however, have been allayed by provisions allowing the imposition of severe penalties for oil spills and other violations of the act. Penalties may also be imposed for violation of the Marine Protection, Research and Sanctuaries Act of 1972 which sets up a permit system to regulate the dumping of specified materials in the ocean. THE COMMON LAW OF PUBLIC NUISANCE IN STATE ENVIRONMENTAL LITIGATION,
K. S. Boger.
Environmental Affairs, Vol. 4 p.367-392 (1975). 26 p, 124 ref.

Descriptors: *Public rights, *Pollution abatement, *Penalties(Legal), *State governments, *Common law, Legal aspects, Judicial decisions, Law enforcement, Legislation, Water pollution, Air pollu-

tion, Pollutants, Water pollution control, Water quality, Water quality control, Water law, Water pollution effects.
Identifiers: *Injunctive relief, *Nuisance(Legal aspects), Standing(Legal).

A public nuisance action brought by the State can be an effective means to control private pollution when statutory and administrative remedies are inadequate and obstacles to its use such as preemption, primary jurisdiction and legislative authorization are overcome. If a State's environmental legislation contains no provision in derogation of the common law, then it seems reasonable to suppose that common law rights of action survive. Furthermore, unless the polluting activity is explicitly authorized by legislation, a public nuisance action against the offending activity should be permitted. In contrast, despite the availability of the public nuisance action, a private action to enjoin a public nuisance before it occurs has yet to be accepted by any jurisdiction without adherence to traditionally strict standing requirements. JAPAN AND THE UNITED NATIONS CONFERENCE ON THE LAW OF THE SEA,
Johns Hopkins Univ., Washington, D.C., School for International Studies.
L. Wells, II.
Ocean Development and International Law, Vol. 2 p. 65-91 (1974). 27 p, 76 ref.

Descriptors: *Foreign countries, *United Nations, *International law, *Law of the sea, *Natural resources, Governments, Foreign waters, Legal aspects, Water law, Treaties, Foreign trade, Fishing, International waters, Commercial fishing, Economics, Mineral industry, Mining, Ownership of beds, Oil, Water resources, Navigable waters.
Identifiers: *Japan, *United Nations Conference on the Law of the Sea, Coastal waters.

Japan's dependence on the sea will have marked effects on Japan's position at the United Nations Conference on the Law of the Sea. Due to its lack of natural resources and the importance of its foreign trade, Japan is more dependent on the seas than any other major nation. Japanese interests have been well served to date by the existing law of the sea and Japan doubtless will press for re-affirmation of freedom of the seas as a fundamental principle at the UN Conference. However, despite this dependence, Japan has maintained a flexible stance on most major issues, avoiding the extreme stands taken by many other States. This flexibility will reduce the likelihood of having to make multiple concessions in exchange for the retention of are cardinal point. The author concludes that due to Japan's favorable relations with Third World and resource-rich countries, Japan should emerge from the Conference with its vested interests mostly intact. WISCONSIN PUBLIC PARTICIPATION PROCEDURES.
In: 1974 BNA Environmental Rep. 951:0581-85 (Wisc. Ad. Code, Ch. NR3, 1974). 5 p.

Descriptors: *Permits, *Administrative decisions, *Wisconsin, *Decision making, *Comprehensive planning, Administration, Coordination, Management, Planning, Scheduling, Timing, Legislation, Adoption of practices, State governments, Public rights.
Identifiers: Public hearings, *Public participation.

To insure that interested persons are given the opportunity to make applicable comments, the Secretary of the Wisconsin Department of Natural Resources is required to issue public notice of the receipt of a completed permit application. The content and circulation requirements of this notice are set forth. To allow interested persons to make an oral statement, procedures are also set forth concerning the holding of a public hearing. If the request for such a hearing is made by the Environmental Protection Agency, any state effected by the discharge, or by a petition signed by 5 or more persons, the holding of a public hearing will be mandatory. In all other cases, the holding of a hearing shall be at the discretion of the Department. If a public hearing is held, appropriate notice shall be given. The regulations also set forth reiquirements pertaining to the location of the hearing, persons entitled to participate in the hearings, the conduct and transcripts of the hearing, and requests for changes in time or place of hearing. Identifiers: *Public hearings.

To assist persons who are required to obtain a number of permits before undertaking projects that will effect water resources, the state of Washington has created a mechanism that will coordinate the decision making of all interested administrative agencies. Under this mechanism, a person may file one master application to the department of ecology seeking the issuance of all permits necessary for the project. When the department receives this application, it will advise state agencies who might have permit requirements concerning the project. If notified agencies do not express an interest within a specified time, they will be barred thereafter from requiring permits for the applicant's project. If any agencies affirmatively respond, the department will forward to the applicant all necessary forms which must be completed. Upon the return receipt of these forms, the department shall give public notice of the proposed project and shall allow 30 days for the receipt of public comments. Whether a public hearing will be required before any final decision is made will depend on attendant circumstances. After all participating agencies have sent their final decision to the department, the department shall incorporate them into one document which will be transmitted to the applicant. WASHINGTON DEPARTMENT OF ECOLOGY ORGANIZATION,
In: 1973 BNA Environmental Rep. 941:0501-02 (Wash Ad Code, Ch. 173-02, 173-06). 2 p.

Descriptors: *Washington, *Administrative agencies, *Comprehensive planning, *Ecology, *Administration, Organizations, Management, Economics, Planning, Operations, Environmental effects, Water resources development, Law enforcement, Operations research, Scheduling, Monitoring, Technology, Research and development.

The purpose of these regulations is to assist interested persons in dealing with the department of ecology by describing its organization and

methods. The department is divided into two branches: the public services branch, which consists of the office of technical services and the office of operations; and the administration and planning branch, which consists of the office of administration and the office of planning and program development. The office of technical services is responsible for coordinating local pollution control activities and for providing laboratory services and technical assistance. The office of operations is primarily responsible for the regulatory, financing and enforcement responsibilities pertaining to pollution control activities. Duties pertaining to fiscal and administrative functions, such as records control and public information services, are the responsibility of the office of administration. Finally, the office of program planning and development is responsible for making environmental impact reviews of major projects and for developing planning standards and criteria. Apart from these specialized duties, the department of ecology shall be responsible for the protection, improvement and maintenance of the state's water resources. (Hoffman-Florida)

WASHINGTON HEARINGS REGULATIONS.
In: 1975 BNA Environmental Rep 94:0741 (Wash. Ad Code, 173-225-010 through 173-225-030, 1975). 1 p.

Descriptors: *Washington, *Federal Water Pollution Control Act, *Waste water disposal, *Environmental effects, *Administrative agencies, Administration, Permits, Adoption of practices, Federal government, State governments, Administrative decisions, Water quality standards, Discharge(Water), Regulation.
Identifiers: Certification statement, Public hearings.

Pursuant to Section 401 of the Federal Water Pollution Control Act (FWPCA), all applicants seeking a federal permit pertaining to discharges into navigable waters must obtain a certification from the state in which the discharge originates. This certification should state that the discharge complies with applicable provisions of sections 301, 302, 306 and 307 of the FWPCA. Because the issuance of permits could have profound environmental effects, public notice of the application for a certification must be mailed to all interested persons and to any other person on request. If the particular application is deemed to be of a general public interest, public notice of the application must be made in a specified manner in a county newspaper of general circulation. Any member of the public may make written comments to the department of ecology within 20 days after the last public notice of the application. If the department determines that a particular application is of sufficient public interest, it may hold a public hearing, in the manner prescribed, for the submission of oral views. FISHERY FOR KING CRAB IN ALASKA.
National Marine Fisheries Service, Washington, D. C.
40 Fed Reg 16216-17 (1975). 2 p.

Descriptors: *Crabs, *Commercial shellfish, *Alaska, *Fisheries, *Fish conservation, Programs, Management, Conservation, Protection, Resources, Wildlife, Harvesting, Permits, Labor, Capital, Investigations, Ships, Regulation.
Identifiers: *King crab.

These regulations set forth specific statistical and registration areas and requirements for registration of all king crab vessels in Alaska. In 1970 Alaska established certain area quotas for the allowable harvest of king crabs. The result was the expansion of king crab fishing into the Bering Sea, and the replacement of older wooden vessels with new steel vessels. Alaska now regulates the harvests and open seasons for United States king crab vessels fishing in the Bering Sea. There is concern that excessive numbers of vessels and gear exist in the king crab fishery, detrimentally affecting the ability of the state to manage it. The Alaska Commercial Fisheries Entry Commission has authority to limit or reduce the number of entry permits to a manageable level. It is proposed that until the Commission is able to determine the appropriate number of entry permits that should be outstanding, the king crab fishery in Alaska should be a Conditional Fishery and thus ineligible for financial assistance programs for adding vessels or gear to the fishery. NAT. RES. DEF. COUNCIL V. TRAIN. (FEDERAL WATER POLLUTION ACT AMENDMENTS).
396 F Supp 1393-1402 (D.D.C. 1975). 10 p.

Descriptors: *United States, *Judicial decisions, *Federal Water Pollution Control Act, *Permits, *Effluents, Legal aspects, Water law, Judicial decisions, Federal government, Organizations, Regulation, Wastes, Water pollution sources, Water pollution control, Water pollution abatement, Water quality, Water quality control, Industrial wastes.
Identifiers: *FWPCA Amendments of 1972, Effluent limitations.

Plaintiff environmental group brought an action against defendant Administrator of the Environmental Protection Agency (EPA) for declaratory judgement concerning the power of defendant to exempt certain point sources from the permit requirements under the Federal Water Pollution Control Act. Plaintiff contended that under the regulations embodied in the Act, all point sources must obtain permits before they can discharge pollutants into navigable waters. The Act did not give the Administrator of the EPA the discretion to exempt any point sources from the permit requirements. Defendant contended that the exempted point sources were ill-suited for inclusion in a permit program and the program would operate most efficiently by defendant exercising his discretion in exempting these sources. The District Court for the District of Columbia held that under the Federal Water Pollution Control Act, all point sources were intended to be covered by the permit program. Defendant did not have discretion under the Act to exempt certain point sources from the program. (Nursey-Florida)

IDAHO FISH AND GAME ASS'N V. PICABO LIVESTOCK, INC. (PUBLIC'S RIGHT TO USE A NAVIGABLE STREAM).
528 P2d 1295-98 (Idaho 1974). 4 p.

Descriptors: *Public rights, *Idaho, *Judicial decisions, *Navigable waters, *Recreation, Legal aspects, Water law, State governments, Running waters, Navigation, Water sports, Riparian rights, Water utilization, Public access.

Identifiers: *Water rights(Non-riparian).

Plaintiff fish and game association brought a declaratory judgement action against defendant corporation to determine the rights of the public to the use of a creek which flowed through defendant's property. Plaintiff contended that the creek was navigable because it would float logs, and therefore, the public had the right to use the creek for recreational purposes. The Supreme Court of Idaho held that the creek was navigable in that logs over six inches in diameter could be floated on it to a place of use. The court further held that the public had the right to use the creek for all recreational purposes. (Nursey-Florida)
W76-06524

STOCK V. STATE (CONSTITUTIONALITY OF STATE ENVIRONMENTAL CONSERVATION ACT).
526 P2d 3-18 (Alas. 1974). 16 p.

Descriptors: *Alaska, *Judicial decisions, *Constitutional law, *Penalties(Legal), *Water pollution control, Legal aspects, Water law, State governments, Legislation, Water pollution, Pollutants, Water pollution sources, Water pollution abatement, Water quality, Water quality control, Sewage, Wastes.
Identifiers: Due process, *Alaska State Environmental Conservation Act.

Defendant corporation president was convicted of willfully polluting state waters in violation of the Alaska State Environmental Conservation Act. Defendant appealed on grounds that the statutory definition of the prohibited 'pollution' was unconstitutionally vague in that men of ordinary intelligence could not know which activities were proscribed. Defendant further contended that the fines of $25,000 for negligent violations and $1000 per day for willful violations constituted cruel and unusual punishment. The Supreme Court of Alaska held that although the statute may have failed to give adequate notice as to all types of conduct which were punishable, defendant's actions of dumping raw sewage into a stream running through residential areas were clearly within the outer boundaries of prohibited conduct. Therefore, the statute was not unconstitutionally vague as applied to defendant. The court further held that the fines prescribed by the statute were not so disproportionate to the offense as to be considered cruel and unusual punishment. (Nursey-Florida)
W76-06525

CAMPBELL ESTATES, INC. V. BATES (PUNITIVE DAMAGES FOR DITCH DUMPING ALL DRAINAGE ON ADJOINING PROPERTY).
517 P2d 515-23 (Ariz Ct App 1973). 9 p.

Descriptors: *Arizona, *Judicial decisions, *Drainage effects, *Adjacent land owners, *Penalties(Legal), Legal aspects, Water law, State governments, Drainage, Drainage systems, Surface drainage, Drainage water, Ditches, Surface waters, Water control, Natural flow, Alteration of flow, Relative rights.
Identifiers: Intentional torts, Punitive damages.

Plaintiff landowners brought an action against defendant adjacent landowners for damage caused by defendants' dumping drainage directly onto plaintiffs' property. Plaintiffs sought both actual and punitive damages, contending that defendants had, by use of bulldozers, created a flood channel which emptied all the floodwaters from defendants' property onto a portion of plaintiffs' property. The natural watercourse which existed before the construction of the ditch had run across defendants' property a considerable distance from the ditch. The Arizona Court of Appeals affirmed the trial courts' conclusion that the defendants had changed the natural flow of the surface water in such a manner that surface waters were collected in an artificial channel and discharged onto plaintiffs' land. The Court further held that punitive damages were justified by defendants' action in building the ditch without consulting adjacent landowners. (Nursey-Florida)
W76-06526

MYERS V. HARRIS (MUST BE CLEAR AND CONVINCING EVIDENCE THAT MEANDER LINE MEANT TO BE BOUNDARY).
519 P2d 1307-09 (Wash Ct App 1974).

Descriptors: *Washington, *Judicial decisions, *Accretion(Legal aspects), *Boundaries(Property), *Ownership of beds, Legal aspects, Water law, State governments, Pacific Ocean, Meanders, High water mark, Boundary disputes, Adjacent landowners, Shores, Water rights, Tidal waters, Bodies of water, Oceans.
Identifiers: Coastal waters, Presumptions(Legal).

Plaintiff landowners brought an action to quiet title to land formed by accretion along the Pacific Ocean. The deed which conveyed the land described one of the boundaries as the meander line of the Pacific Ocean. Defendant contended that the meander line formed the boundary of the property and, therefore, plaintiffs were not owners of any land formed by accretion subsequent to the conveyance. The Washington Court of Appeals held that under state law, a deed which uses a meander line to describe the boundaries of oceanfront property conveys the property to the water unless there is clear and convincing evidence that the grantor intended the meander line to be the actual boundary. No such evidence was found here. Thus plaintiffs had title to the accreted land between the meander line and the line of mean high tide. (Nursey-Florida)
W76-06527

TAYLOR DITCH CO. V CAREY (DAMAGE TO NEARBY PROPERTY FROM IRRIGATION DITCH SEEPAGE).
520 P2d 218-30 (Wyo. 1974).

Descriptors: *Canal seepage, *Damages, *Adjacent land owners, *Wyoming, *Judicial decisions, Legal aspects, Water law, Drainage systems, State governments, Construction, Penalties(Legal), Seepage, Canals, Conveyance structures, Leakage, Canal construction, Water conveyance, Canal design, Canal linings.
Identifiers: *Negligence, Injunctive relief, Liability(Legal).

Plaintiff landowners brought an action against defendant ditch company for damage allegedly caused to plaintiffs' property by seepage from a canal built and maintained by defendant. Plaintiffs contended that defendant was negligent in failing to maintain the canal in such a manner that water would not seep from the canal onto plaintiffs' property. The Wyoming Supreme Court held that defendant had a duty to exercise due to care in maintaining the canal and was negligent in its failure to prevent water from seeping onto plaintiffs' property. However, since there was insufficient proof that the damage to plaintiffs' property had been caused by the seepage, the court did not award money damages, but gave injunctive relief only. (Nursey-Florida)
W76-06528

STATE EX REL STATE GAM COMM'N V GOLD HILL IRR. DIST. (NO LIABILITY FOR RELEASING AQUATIC SOLVENT INTO CANALS WHICH OVERFLOWED CAUSING FISHKILL).
523 P2d 1287-91 (Ore Ct App 1974).

Descriptors: *Oregon, *Judicialdecions, *Water pollution effects, *Fishkill, *Penalties(Legal), Legal aspects, Legislation, Law enforcement, State governments, Water law, Fish, Fish conservation, Sport fish, Water pollution, Water pollution sources, Water pollution control, Pollutants, Wastes, Wildlife conservation, Path of pollutant, Bodies of water, Overflow.

Plaintiff State Game Commission brought an action against defendant irrigation district pursuant to an Oregon statute which provides for recovery of damages for the knowingly unlawful killing of game birds, animals and fish. Plaintiff alleged that defendant had intentionally released a quantity of a petroleum related product into one of its water canals and that upon the overflow of the canal, the product passed into a river killing thousands of game fish. Defendant contended that at the time it placed the solvent into the canal it was not aware that the canal would overflow causing the fishkill. The Oregon Court of Appeals held that under the statute liability attaches only if defendant commits the act knowing it will result in the unlawful killing of game animals. Since there was insufficient evidence to show that defendant knew that placing the solvent into the canal would result in the fishkill, defendant could not be held liable under the statute. (Nursey-Florida)
W76-06529

RAMADA INNS, INC. V. SALT RIVER VALLEY WATER USERS' ASS'N (NO STRICT LIABILITY FOR CANAL'S FLOODING OF HOTEL).
523 P2d 496-99 (Ariz. 1974). 4 p.

Descriptors: *Artificial watercourses, *Canals, *Arizona, *Judicial decisions, *Floodwater, Legal aspects, Water law, Penalties(Legal), State governments, Benefits, Watercourses(Legal aspects), Surface waters, Diversion structures, Levees, Running waters, Flood damage.
Identifiers: Strict liability, Public policy.

Plaintiff hotel brought an action against defendant water users' association for damage caused to the hotel by floodwaters diverted by defendant's canal. Plaintiff's complaint alleged liability based on numerous theories including a theory of strict liability. Plaintiff contended that the canal had become a dangerous instrumentality and that its owners should be subject to strict liability for reasons of public policy. Defendant argued that the canal had been in existence for so long that it should be considered to be similar to a natural watercourse. The Supreme Court of Arizona held that due to the utility and necessity of the canal, strict liability should not be imposed upon its maintenance and existence. Those landowners who chose to locate near the canal assumed the burden of loss in situations not involving the element of fault. (Nursey-Florida)
W76-06530

WERNBERG V STATE (PAYMENT OF JUST COMPENSATION FOR TAKING OF LITTORAL PROPERTY RIGHTS).
516 P2d 1191-1201 (Alaska 1973). 11 p.

Descriptors: *Littoral, *Alaska, *Judicial decisions, *Eminent domain, *Riparian rights, Legal aspects, Constitutional law, State governments, Water law, Economics, Navigable waters, Navigation, Obstruction to flow, Riparian waters, Fishing, Commercial fishing, Construction, Tidal waters, Water levels.
Identifiers: *Police power.

Plaintiff landowner brought an action in inverse condemnation against the state of Alaska and the city of Anchorage. Plaintiff alleged that defendants took a property right without just compensation, and that a highway constructed by defendants obstructed the flow of high tide waters up a creek, thereby destroying its navigability. Plaintiff had used this creek for twenty years to navigate his fishing boats to deep water for commercial fishing. Defendants contended that under the police power of the State to regulate navigable waters, the State could obstruct the flow of tide

waters without compensating plaintiff for his loss. The Supreme Court of Alaska held that under Alaska law the State may take riparian or littoral property rights for public use, but when this taking is for a use other than to aid navigation, just compensation must be paid for the taking. The court held that the plaintiff had a littoral right to the use of the creek to gain access to deep waters; consequently, the State's destruction of the navigability of the creek constituted a taking of a property right which required just compensation by the State. (Nursey-Florida)
W76-06531

PIERCE V RILEY (ACCESS TO LAKE BY NON-RIPARIAN OWNERS IMPERMISSIBLE EVEN THOUGH OVER THE LAND OF A RIPARIAN OWNER).
215 NW2d 759-62 (Mich. Ct. App. 1974). 4 p.

Descriptors: *Michigan, *Riparian land, *Riparian rights, *Reasonable use, *Easements, Legal aspects, Land use, Lakes, Water law, Real property, Channels, Access routes, Judicial decisions, Relative rights, Canals.
Identifiers: *Commercial exploitation.

Defendant riparian owners developed a tract of property which did not front on the lake. To make the development more commercially attractive, the defendants dug a canal through their riparian lot so as to provide access to the lake for a large number of non-riparian lot owners. Subsequently, the other riparian owners brought an action alleging that defendants use of their riparian property put an undue burden on the lake. After the trial court had found for defendants, plaintiffs appealed to the Court of Appeals which reversed, finding that the developers had made unreasonable use of their riparian land for the sole purpose of commercial exploitation. The case was therefore remanded to the trial court to grant plaintiffs appropriate relief. Subsequently, the trial court enjoined defendants from granting easements to the lake to any of the non-riparian lot owners, but refused to order them to fill the channel since plaintiffs had requested no such relief in their complaint. Plaintiffs once again appealed, contending that if the channel was not filled, there would be no way to enforce the court order, short of constant police vigilance. The Court of Appeals agreed and ordered that the channel be filled. (Hoffman-Florida)
W76-06532

AURICELLA V. PLANNING AND ZONING BOARD OF APPEALS (STATE PREEMPTION OF AUTHORITY OVER ALL TIDAL WETLANDS).
42 A2d 374-80 (Conn. Ct Com Pleas 1974). 7 p.

Descriptors: *Judicial decisions, *Building codes, Zoning, *Connecticut, *Wetlands, Governmental interrelations, State governments, Local governments, Water, Water law, Legal aspects, Permits, Regulation, Administrative agencies, Tidal marshes, Construction, Buildings, Coasts.
Identifiers: State policy.

Plaintiffs, vendors and purchasers of real property, were denied a building inspector's permit to construct dwellings on grounds that a special exception was required due to the location of the premises in a wetlands area. Plaintiffs appealed that decision as well, and requested a special exception from defendant planning and zoning board of appeals. The zoning board ruled against plaintiffs, basing its decision on town building zone regulations. On appeal, the Court of Common Pleas of Connecticut concluded that, by legislative mandate, tidal wetlands such as the property in question were to be regulated solely by the state. However, certain sections of the town's zoning regulations were found to be inconsistent with state tidal wetlands law. Following the rule that ordinances, subject to certain exceptions inapplicable in this case, must not conflict with state statutes, the court declared the conflicting regulations void and of no legal effect. Since plaintiffs' proposed dwellings were otherwise in conformance with the town's zoning regulations, the court ordered defendant to sustain plaintiffs' appeal from the building inspector's denial of construction permits. (Schilling-Florida)
W76-06533

DOLPHIN LANE ASS., LTD. V. SOUTHAMPTON (LOCATION OF SHORELINE PROPERTY BOUNDARY BY CUSTOMARY METHOD OF VERBAL FORMULATION).
372 NYS2d 52-55 (Ct. App. 1975). 4 p.

Descriptors: *New York, *Boundaries(Property), *High water mark, *Seashores, *Boundary disputes, Local governments, Water, Water law, Legal aspects, Judicial decisions, Bays, Beaches, Bodies of water, Shores, Coasts, Governments.
Identifiers: Coastal lands, State policy.

Plaintiff landowner brought suit against defendant town to establish the boundary line of plaintiff's shoreside property. It was undisputed that the correct boundary line of the property was the high-water line. The parties' dispute centered on the proper method by which the high-water mark should be precisely located on the land. Although evidence strongly indicated that it had previously been normal practice to locate the high-water line by reference to the line of vegetation, the trial court adopted the 'type-of-grass' test introduced by defendant. On appeal, the Court of Appeals of New York held that the application of that test was in error as a matter of law. In its decision the court concluded that no legal significance attached to any hydrographic identification of the exact line of average high water. Stressing the importance of predictability and stability in matters concerning title to real property, the court noted that the established 'line of vegetation' test could not be disregarded without altering the substance of prior conveyances. Thus the case was remanded for the purpose of determining the boundary line by reference to the line of vegetation. (Schilling-Florida)
W76-06534

CHILD V SPANISH FORK (TRANSFERENCE OF IRRIGATION WATER AS PRECEDENT TO ANNEXATION).
538 P2d 184-88 (Utah 1975). 5 p.

Descriptors: *Water transfer, *Utah, *Water rights, *Constitutional law, *Equitable apportionment, Water contracts, Legal aspects, Water law, Water supply, Judicial decisions, Legal review, Economics, Cost allocation, Contracts, Municipal water.
Identifiers: Annexation, Statutory construction.

Defendant city had entered into an agreement whereby it agreed to annex a neighboring area into the city. As part of this agreement, plaintiff landowners were required to transfer ownership of shares of local water. Because this condition was not a part of the original proposal, plaintiffs sought a declaratory judgment that the condition was invalid. Plaintiffs contended that the applicable statute allowed the city to obtain water only by means of purchase, lease or condemnation. They also contended that the city's action was arbitrary and, since present city residents did not have to transfer water rights, denied plaintiffs equal protection. Finally, they contended that the city should have made the entire city pay for the acquisition of more water. After the trial court found for the city, plaintiffs appealed to the Utah Supreme Court. The Court affirmed the decision, however, finding that the statute in question was one of authorization and not one of limitation or restriction. As to the equal protection argument, the Court found that no discrimination existed since all members of the class were treated the same. Finally, the Court found that the city was under no obligation to make all city residents pay for new water. (Hoffman-Florida)
W76-06535

LOS ANGELES V. SAN FERNANDO (PUEBLO RIGHTS TO WATER).
537 P2d 1250-1328 (Cal. 1975). 79 p, 7 append.

Descriptors: *Priorities, *California, *Preferences(Water rights), *Pueblo water rights, *Competing uses, Legal aspects, Judicial decisions, Legal review, Common law, Groundwater, Prescriptive rights, Water law, Imported water, Water demand, Water distribution, Water resources, Water supply, Water distribution, Appropriation.

Plaintiff city brought suit against defendant cities seeking to obtain a declaratory judgment as to its prior rights to water underlying the upper Los Angeles River area (ULARA). Plaintiff was also seeking to enjoin defendants from extracting water from this area unless such extraction was in subordination to plaintiff's prior rights. Following an adverse decision, plaintiff appealed to the California Supreme Court. After an extensive review of the history of pueblo water rights, the Court determined that plaintiff had such rights to all waters of the Los Angeles River needed for the reasonable use of its inhabitants. The Court went on to find that these pueblo rights extended to the ground waters of other areas besides the ULARA. However, the pueblo rights of the plaintiff did not include groundwater in basins that were independent from the Los Angeles River bed. Relying basically on this pueblo right determination, the Court also reversed the trial court on several other issues including: the right of plaintiff to sell groundwater derived from water from outside the ULARA; the prescriptive claims of the two parties; and the rights of the parties concerning imported water. Before reversing and remanding, the court went into an extensive review and analysis of existing law on all of these issues. (Hoffman-Florida)
W76-06536

BOROUGH OF MORRISVILLE V. DELAWARE RIVER BASIN COMMISSION (1958 FEDERAL WATER SUPPLY ACT, SURFACE WATER USE).
399 F Supp 469-79 (E D Pa 1975). 11 p.

Descriptors: *Equitable apportionment, *River basin commissions, *Pennsylvania, Reservoir construction, *Delaware River, Water storage, Dependable supply, Legal aspects, Judicial decisions, Water rates, Water law, Water rights, Water distribution(Applied), Constitutional law, Water users, Water utilization, Economics.
Identifiers: Pooled water doctrine, *National Environmental Policy Act, *Environmental impact statements.

In order to raise capital to construct two reservoirs, defendant River Basin Commission imposed charges for the use of the surface waters of the Delaware River. Defendants justified this rate imposition on the 'pooled water' concept, which holds that the enlargement of a river basin water supply benefits all users, regardless of whether that benefit is direct or indirect. Plaintiff municipalities rejected this premise, however, contending the Commission was required to relate any costs charged to a user for a project to the specific benefits derived by that user. Plaintiffs also based their request for injunctive relief on the contention that the Commission's actions exceeded its authority under the Delaware River Basin Compact, and violated certain federal statutes. Furthermore, the National Environmental Policy Act required the issuance of an environmental impact statement (EIS) before the adoption of the rate structure. The trial court rejected these contentions, however, and granted summary

judgment for plaintiffs after making the following findings of fact: the adoption of a rate structure did not put the Commission in the business of distributing water in violation of the compact; the water use charges did not constitute an unlawful taking since the constraints of equitable apportionment were not violated; and an EIS is required only upon a showing that an action will adversely affect the environment. (Hoffman-Florida)
W76-06537

TAYLOR V CARRICO (NO LIABILITY FOR SPILLOVER OF ARTIFICIALLY ACCUMULATED WATER WHICH IS NOT A NUISANCE).
528 SW2d 694-96 (Ky. Ct. App. 1975).

Descriptors: *Kentucky, *Overflow, *Dams, *Farm ponds, *Lakes, Spillways, Water levels, Rain water, Rainfall-runoff relationships, Runoff, Surface runoff, Storm water, Judicial decisions, Legal aspects, Legal review, Watercourses(Legal aspects), Water control, Water injury, Water storage.

Plaintiff farm owners brought an action for injunctive relief and to recover damage resulting from the overflow of water from defendants' dam-created lake. Plaintiffs contended that as a result of heavy rains, water from the artificial lake on defendants' farm had flowed through the spillway and then across a road and onto plaintiffs' farm. The court agreed that a landowner who through artificial means causes water to accumulate on his land in such way as to constitute a nuisance is liable for any damage resulting from the escape of the accumulated water. The Kentucky Court of Appeals found no nuisance was created. Furthermore, defendants' use of their land was reasonable in that benefits derived from such use outweighed any harm to plaintiffs. Finally, the court held that the evidence introduced did not support a finding of any damages from the overflow. (Welch-Florida)
W76-06538

ARNETT V COMMONWEALTH DEPARTMENT OF HIGHWAYS (LIABILITY FOR DAMAGES TO CROPS CAUSED BY DIVERSION OF WATER RESULTING FROM BRIDGE CONSTRUCTION).
528 SW2d 678-79 (Ky. Ct. App. 1975). 2 p.

Descriptors: *Bridge construction, *Damages, *Kentucky, *Streams, *Diversion, Diversion losses, Structures, Engineering structures, Judicial decisions, Alteration of flow, Riparian rights, Bridge design, Bridges, Constitutional law, Civil engineering, State governments, Administrative agencies, Legal aspects, Legal review.

Plaintiff landowners sought damages from defendant Department of Highways, alleging that the state of Kentucky had constructed a bridge across a stream on plaintiffs' property which resulted in a diversion of water. This diversion, plaintiffs claimed had ruined their crops and thus constituted a taking of property without just compensation. Defendant contended plaintiffs' action was barred by the statute of limitations and that purchase of the realty by plaintiffs after construction of the bridge deprived plaintiffs of standing to sue for the allegedly destructive diversion of water. The Kentucky Court of Appeals held the controlling question to be when the damage occurred, not when the bridge was built. Thus the complaint was not barred by the statute of limitations. On the standing question, the court held that, not withstanding plaintiffs' purchase of the property, if the state was creating a nuisance, plaintiffs could sue for compensation. The trial courts decision was reversed and remanded. (Welch-Florida)
W76-06539

SIERRA CLUB V. MORTON (PROHIBITION OF DAMS AND DIKES ACROSS NAVIGABLE WATERS UNDER RIVER AND HARBORS ACT OF 1899).
400 F. Supp. 610-52 (ND Cal. 1975). 43 p, 1 map.

Descriptors: *Navigable waters, *California, *Inter-basin transfers, *Water transfer, *Rivers and Harbors Act, Water supply development, Water resources, Water management(Applied), Water rights, Judicial decisions, Permits, Legislation, Dams, Environmental effects.
Identifiers: *Environmental impact statement, *California Water Project.

To redistribute California's water supply from water-rich areas to water-deficient areas, several water transfer facilities were constructed pursuant to the California Water Project. Protesting the construction and operation of these facilities plaintiff conservation groups brought an action contending that a permit was required under the Rivers and Harbors Act of 1899 before such operation could continue. The plaintiffs also contended that any such permit issuance would constitute a major federal action requiring the preparation of an environmental impact statement (EIS). At trial, the court agreed that the operation of two water project plants interfered with the navigable capacity of various waters in violation of the Rivers and Harbors Act, but rejected the plaintiffs' claim that certain structures of the project plants constituted dams or dikes over or in navigable waters. As to the EIS claim, the court found that the issuance of the permit would constitute a major federal action; however, the Army Corps of Engineers was not required to prepare an EIS if another agency was already in the process of issuing one concerning the same action. (Hoffman-Florida)

UNITED STATES V KENNECOTT COPPER CORP (VIOLATION OF STATUTORY REQUIREMENT TO IMMEDIATELY REPORT OIL DISCHARGE INTO NAVIGABLE WATERS).
523 F2d 821-24 (9th Cir 1975). 4 p.

Descriptors: *Oil pollution, *Administrative agencies, *Federal Water Pollution Control Act, *Oil spills, Water pollution, Legal aspects, Water law, Legislation, Federal government, Judicial decisions, Law enforcement, Water pollution sources, Water pollution control, Oil pollution, Pollutants, Water quality, Water quality control, Water quality act.
Identifiers: FWPCA Amendments of 1972, Administrative regulations.

Defendant corporation was convicted of a violation of a provision of the Federal Water Pollution Control Act Amendments of 1972 requiring that any person in charge of an onshore oil facility immediately notify an appropriate governmental agency of a known oil spill. Defendant appealed the conviction contending that the provision was void for vagueness because the statute failed to define adequately the terms 'immediately notify' and 'appropriate governmental agency'. The Court of Appeals held that the provision was valid since the statutory scheme clearly defined the term 'appropriate governmental agency' as encompassing any federal agency concerned with water and environmental pollution or navigable waters. The term 'immediately notify' was deemed to require notification be given reasonably promptly. The judgement was affirmed. (Nursey-Florida)
W76-06541

SOUTHERN NAT. GAS CO. V GULF OIL CORP. (LIABILITY FOR DAMAGES TO UNDERWATER PIPELINE BY DREDGE WHICH WAS A 'VESSEL IN NAVIGATION').
320 So2d 917-26 (3d La. Ct. App. 1975). 10 p.

Descriptors: *Damages, *Navigable waters, *Louisiana, *Dredging, *Channel improvement, Stream improvement, Channels, Water law, Legal aspects, Navigation, Ownership of beds, Streambeds, Riparian rights, Canals, Negligence, Accidents, Hazards, Risks, Judicial decisions, Penalties(Legal), Watercourses(Legal aspects), Pipelines, Underwater.
Identifiers: Comparative negligence, Admiralty law.

Plaintiff owner of a natural gas pipeline brought this suit for damages sustained when defendant corporation's dredge ruptured plaintiff's pipeline. Defendants did not contest the trial court's holding of negligence but contended that the canal in which the dredging took place was navigable and, therefore, that the substantive law of admiralty required the application of the doctrine of comparative negligence. The Louisiana Court of Appeals agreed with defendant, finding the canal to be a navigable waterway even though it was privately owned, and that even if the pipeline was beneath the surface of the water, such damage was caused by a vessel in navigation on navigable waters. Thus the application of substantive admiralty law was required. Furthermore, plaintiff's failure to remove the pipeline or to place adequate warning signs along it even after a prior dredging accident rendered the plaintiff equally at fault in the canal dredging accident. Consequently the court required plaintiff to bear half the loss. (Welch-Florida)

WESTERRELT V. NATURAL RESOURCES COMMISSION (RULES TO REGULATE WATERCRAFT AND LIVERIES ON THE AUSABLE, MANISTEE, PINE AND PERE MARQUETTE RIVERS VOID AS OVERBROAD).
233 NW2d 640-43 (Mich. Ct. App. 1975). 4 p.

Descriptors: *Legislation, *Constitutional law, *Michigan, *Natural resources, *Watercourses(Legal aspects), Water users, Water law, Administrative agencies, Regulation, Rivers, Water sports, Pollution abatement, Wildlife conservation, Boating, Legal aspects, River regulation, Control, Control systems, Management, Penalties(Legal), Water rights.
Identifiers: Administrative regulations.

Plaintiff boat and canoe livery operators brought this section against defendant commission seeking a temporary injunction against enforcement of proposed rules regulating watercraft and liveries on the AuSable, Manistee, Pine and Pere Marquette Rivers and also seeking a declaratory judgement as to the validity of the proposed rules. The plaintiffs contended the proposed rules denied them several constitutional rights and exceeded the commission's authority. The Michigan Court of Appeals found that the legislature had not specified the method by which the commission was to effectuate its purpose nor what type procedures were to be contemplated. Since the rules, which were promulgated pursuant to legislative statute delegating complete control of wildlife preservation and of pollution prevention in state waters, failed to provide the defendant with any workable standards by which to perform the task, the rules were void and of no force or effect. (Welch-Florida)
W76-06543

COMSTOCK V. WHEELOCK ('HIGHWAY BY USER' STATUTE NOT APPLICABLE TO GIVE PUBLIC PRESCRIPTIVE RIGHT TO LAKE PROPERTY).
234 NW2d 448-52 (Mich. Ct. App. 1975). 5 p.

Descriptors: *Docks, *Easements, *Prescriptive rights, *Michigan, *Public rights, Public access, Public benefits, Legal aspects, Trespass, Judicial decisions, Right-of-way, Scenic easements,

Highways, Prescriptive rights, Water law, Riparian rights, Recreation, Boat-launching ramps.

Plaintiff property owners brought suit to halt construction by defendant adjacent landowner of a boathouse upon defendant's property which allegedly had been used by the plaintiffs and the general public for over seventy years for swimming, boating, snowmobiling and generally for access to a lake. The plaintiffs contended the property had been used and dedicated as a public highway under the 'highway by user' statute and that they had thus acquired prescriptive easement rights upon the property. The Michigan Court of Appeals held that the public could not obtain prescriptive rights in property which was used for solely recreational purposes. The court agreed with the plaintiffs that the public could acquire rights in a private roadway under the doctrine of 'highway by user', but held that in this situation the elements of the cause of action had not been met, namely: (1) a defined line used and worked upon by public authorities, (2) travelled by the public for 10 consecutive years without interruption, and (3) with such public usage open, notorious and exclusive. The court further held that such suit could properly be brought only by public officials. This plaintiff had no standing even to assert public rights. (Welch-Florida)
W76-06544

HARRIS V. BD. OF WATER AND SEWER COMM'N (RECOVERY FOR FIRE DAMAGE TO RESTAURANT FROM LACK OF WATER IN FIRE HYDRANT).
220 So2d 624-31 (Ala. 1975). 8 p.

Descriptors: *Public utilities, *Hydrants, Alabama, *Water contracts, *Dependable supply, Pumped storage, Water delivery, Water management(Applied), Water supply development, Water users, Human population, Hydrants, Equipment, Discharge(Water), Pipes, Water works, Judicial decisions, Legal aspects, Penalties(Legal), Governments, Municipal water, Water supply.
Identifiers: Sovereign immunity.

Plaintiff motel and restaurant owner brought this action against defendant board of water and sewer commissioners to recover for fire loss allegedly incurred by defendant's failure to properly maintain the public fire hydrant and supply of water to it in accordance with the contract between the defendant and the city of Mobile. The plaintiff contended he could sue for breach of that contract as a third party beneficiary; furthermore, by failing to use reasonable care in supplying water the defendant had breached its duty to the plaintiff. The Alabama Supreme Court agreed that plaintiff could sue on the contract as a third party beneficiary and that defendant did not enjoy the traditional defense of sovereign immunity for its failure to maintain an adequate water supply in the hydrants. The court found that the inadequate water supply was enough to show a breach of defendant's duty to all those within the foreseeable area of risk. (Welch-Florida)

...Y V. KAISER (RIGHTS OF OWNERS OF RECORDED PLATS ABUTTING CHANNEL AS COMPARED TO THOSE OF SUBDIVISION DEVELOPER).
242 NW2d 673-77 (Mich. Ct. App. 1975). 5 p, 1 ref.

Descriptors: *Michigan, *Land tenure, *Sea walls, Easements, *Real property, *Channels, Judicial decisions, Legal aspects, Water rights, Management, Retaining walls, Shore protection, Right-of-way.

Plaintiff developer had sold lots in a subdivision ordered by a channel 34 feet in width with a five foot abutting strip of land. Because of the expense involved in maintaining and repairing the existing seawall, the plaintiff brought this action seeking to have the defendant lotowners declared owners of the channel bottom and of the five foot strip. The plaintiff contended that the recorded plot and warranty deed made it clear that the land in question had been granted to the defendants. The trial court rejected the contention, however, granting summary judgement to the defendants and holding that the plaintiff was responsible for maintaining the seawall. On appeal, the judgement was reversed in part and affirmed in part. The Michigan Court of Appeals found that the wording of the warranty deed made it clear that the defendants' property was to extend only to the channel's edge. The court also found that anexpress easement to the channel over the five foot strip was granted by the deed. Consequently, since the applicable law provides that an individual who has an easement over another's property is required to maintain and repair it, the court ordered the defendants to reimburse the plaintiff for any money expended in maintaining and repairing the seawall. A GUIDE TO WISCONSIN'S LAKE MANAGEMENT LAW.
Wisconsin Univ. Extension, Madison.
April 1975. 38 p.

Descriptors: *Cooperatives, *Wisconsin, *Lakes, *Management, *Legislation, Legal aspects, State governments, Water quality control, Protection, Grants, Cost-sharing.
Identifiers: *Lake rehabilitation, Property owners, Lake districts.

Wisconsin chapter 301, laws of 1973, established a joint state-local program for public lake management. Its primary goals were to protect and improve the quality of Wisconsin's lakes, to evaluate and implement various techniques of lake management, and to compile basic lake data. The lake management program involves gathering information on lake problems and identification of the causes, consideration of remedial measures, development of a plan with alternative courses of action, selection of the most feasible rehabilitation and protection proposal, and implementation of the program. To be qualified the water body must be 'accessible to the public via contiguous public lands or easements giving public access.' To be eligible projects must be for protection and rehabilitation, not cosmetic approaches which deal with symptoms but not causes of lake problems. The law provides technical and financial assistance from the state, but lake protection and rehabilitation must be initiated and carried out at the local level by a lake protection and rehabilitation district. The organization, governing body, financial powers, state aids, and boundaries of lake districts are delineated. The petition and resolution methods of lake district formation are compared. FLOOD DAMAGE REDUCTION POTENTIAL OF RIVER FORECAST,
Wisconsin Univ., Green Bay. Coll. of Environmental Science.
H. J. Day, and K. K. Lee.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Proceedings Paper No. 12059, Vol. 102, NO. WR1, p 77-87, April 1976. 4 fig, 3 tab, 12 ref.

Descriptors: *Water resources, *Flood control, *Flood damage, *Land use, Simulation analysis, Mathematical models, Zoning, Hydrology, Economics, Flood plains, River basins, Hydraulics, *Connecticut River, Systems analysis, Estimating, Economics.

An analytical method consisting of a set of hydrologic and economic models is presented for estimating expected flood damage reduction due to simulation of flood plain actions in a river basin. The method is based on the interrelationship of the hydraulic and hydrologic features of the flood plain, physical and economic data on flood-plain structures and their contents. Synthetic stage damage curves for individual residential and commercial structures reduces the need for field data. The method was demonstrated in the Connecticut River Basin where many complex urban flood damage centers exist on the main stem as well as on the tributaries. The analysis and interpretation of the results provided an estimate of the potential value of flood warnings in a basin where a river forecast system coupled with an effective citizen response can be one of the most cost-effective alternatives. (Bell-Cornell)
W76-06435

FLOOD PLAIN AND TSUNAMI INUNDATION AREA ORDINANCE.
County of Maui, Hawaii, Ordinance No. 716 (1972). 3 p.

Descriptors: *Hawaii, *Flood plain zoning, *Flood protection, *Floodways, *Tsunamis, Floods, Channels, Flood plains, Rivers, Streams, Floodwater, Maps, Flood profiles, Floodproofing, Structures, Runoff, Reservoirs, Drainage, Agriculture, Obstruction to flow, Right-of-way, Bulkheads, Safety.
Identifiers: Flood fringe, Tsunami inundation district, Flood protection elevation, Hundred-year flood.

This ordinance establishes regulations and development standards in areas subject to flooding or tsunami inundation. Flood Plain Districts are required to be adopted and designated on the official zoning maps of the county. Uses permitted in the floodway, such as agriculture, loading, parking, and recreation, are specified. Other uses are permitted upon application to and approval by the Planning Commission. Certain uses that would reduce the efficiency or the capacity of the floodway are prohibited. Permitted uses in the Flood Fringe are specified, and certain uses in the Tsunami Inundation District, which are prohibited without application to and approval by the Planning Commission, are also specified. Requirements for proposed subdivisions within the Flood Plain District, such as for channel improvement, for channel right-of-way, and for floodproofing, are specified. Also set forth are conditions upon which the use of a structure for a lawful purpose not in conformity with the provisions of this ordinance can be continued. Violation of this ordinance is a misdemeanor. (Segall-Florida)
W76-06492

SAMPLE SUBDIVISION CONTROL ORDINANCE FOR FLOOD HAZARD AREAS.
Minnesota Dept. of Natural Resources, St. Paul.
Sept. 1971. 61 p, 3 fig, append.

Descriptors: *Adoption of practices, *Minnesota, *Flood plain zoning, *Land use, *Legislation, Land classification, Non-structural alternatives, Land management, Water zoning, Flood protection, Floodways, Regulation, Legal aspects, Penalties(Legal), Comprehensive planning, Administration, Multi-purpose projects.
Identifiers: *Plats.

In an effort to reduce the loss of life and property, and other numerous damages caused by the unwise use of flood plains, Minnesota has published a sample zoning ordinance to guide in the development of flood plain areas. The major purpose of the ordinance is to set up safeguards to assure proper land use. Thus, before any sale of land in designated flood plain areas can be consummated, the developer must submit detailed plats to the platting authority. Furthermore, the developer must convince the authority that the land can be safely used for its intended purpose. The degree of evidence that must be submitted will depend on whether the land is in a floodway area or a flood fringe area. Generally, the only land uses permitted in a floodway zone will be those with low flood damage potential such as agriculture and parking areas. In flood fringe areas, however, the restrictions will not be as severe, and approval of buildings or structures will usually be granted. The ordinance spells out in detail the procedural requirements that must be met in getting a plat approved. It also provides criminal penalties for any violations of its provisions. (Hoffman-Florida)

THE INFLUENCE OF FLOOD HAZARDS UPON RESIDENTIAL PROPERTY VALUES,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agricultural Economics.
D. Damianos.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-251 942, $7.50 in paper copy, $2.25 in microfiche. Ph. D. Dissertation, 165 p, 12 tab, 8 fig. OWRT-A-054-Va.

Descriptors: *Flood control, Water resources, Zoning.
Identifiers: Economic Analysis, Floods.

The economic concept of property as a 'bundle o rights' accruing to ownership suggests that public actions to deal with flood hazards can affect the rights to use and, therefore, the economic value o property. Owners of property might be induced to take actions in the public choice process for selection of alternatives that favor actions enhancing property values. To test this proposition, it is necessary to determine the impact alternativ flood hazard reduction policies may have upo property values. The objectives of this study are t discuss the theoretical arguments for determinin the factors which may influence land valu changes induced by flood hazard reduction pol cies, and to empirically estimate the influence o flood hazard reduction alternatives on propert values. The research was divided into three majo areas of investigation. The basic source of dat was city courthouse and real estate appraiser records.

SYSTEMATIC APPROACHES TO ENVIRONMENTAL IMPACT ASSESSMENT: AN EVALUATION,
Ohio State Univ., Columbus. Dept. of Civil Engineering.
E. E. Whitlatch, Jr.
Water Resources Bulletin, Vol. 12, No. 1, p 123-137, February 1976. 3 fig, 1 tab, 25 ref.

Descriptors: *Environmental effects, *Assessment, *Evaluation, Decision making, Water resources, Projects, Mathematical models, Systems analysis.
Identifiers: *Environmental impact, Linear vector model, Nonlinear evaluation.

Increased public awareness of the environmental effects of large-scale projects and concomittant public participation in the environmental impact assessment process demand that assessment methods and procedures fulfill a wide range of desirable characteristics. These are developed and offered as specific criteria against which currently proposed environmental assessment procedures should be judged. Such procedures as checklists, matrices, networks (stepped matrices), overlays, linear vector analysis, and nonlinear evaluation systems are presented and judged in light of the proposed criteria. It is concluded that the use of checklists, the most common assessment format used to date, does not constitute a viable assessment procedure. Use of the matrix or stepped matrix techniques in conjunction with the linear vector or non-linear evaluation systems, with the latter modified slightly, is seen as an approach to environmental assessment that will achieve most of the established criteria. THE NATIONAL ENVIRONMENTAL POLICY ACT: ITS FIRST FIVE YEARS,
National Aeronautics and Space Administration, Moffett Field, Calif. Ames Research Center.
L. Deutsch.
Environmental Affairs, Vol. 4, p. 3-80 (1975). 78 p, 1 ref.

Descriptors: *Project planning, *Environmental effects, *Legal review, *Water quality control, *Environmental control, Legislation, Legal aspects, Water law, Planning, Regulation, Administration, History, Comprehensive planning, Governmental interrelations, Water policy, Federal jurisdiction, Federal government, Adoption of practices, Judicial decisions.
Identifiers: *Environmental Impact Statement(EIS), *National Environmental Policy Act.

A survey is presented of the requirements of the National Environmental Policy Act (NEPA) within the framework of relevant federal guidelines and court decisions of major significance reported prior to January 1, 1975. The first section of the article analyzes the Act as passed by Congress together with the applicable executive orders and Council on Environmental Quality regulations which have interpreted it. The second section deals with judicial interpretation of NEPA, and discusses various topics involved with this interpretation, including: (1) threshold issue; (2) adequacy of the environmental impact statement; (3) other rights created by NEPA; and (4) substantive rights under the NEPA. One of the most publicized and litigated provisions of NEPA is the procedural mandate which requires the issuance of an environmental impact statement to accompany every report on proposals for legislation and other major Federal actions significantly affecting the quality of the human environment. Because of the pervasive impact this requirement has put on all major development projects, special emphasis and consideration is given to judicial interpretation of the phrase 'major Federal action significantly affecting the quality of the human environment'. Emphasis is also placed on what the courts have required as to the adequacy of facts and information presented in the environmental impact statements. (Hoffman-Florida)

THE ECOLOGICAL BASIS FOR THE AUGUST 1, 1973 GUIDELINES OF THE COUNCIL ON ENVIRONMENTAL QUALITY, AND SOME IDEAS FOR THE PREPARATION OF ENVIRONMENTAL IMPACT STATEMENTS,
Minnesota Univ., Minneapolis. Water Resources Research Center.
B. E. Willard.
In: Minnesota Water Resources Research Center, Bull 78, p. 1-10, January 1975. 11 p.

Descriptors: *Balance of nature, *Comprehensive planning, *Ecosystems, *Environmental effects, Niches, Economics, Evaluation, Conservation, Decision making, Project planning, Food chains, Engineering, Environmental engineering, Biology, Evolution, Path of pollutants, Pollutants, Pollution abatement, Limiting factors, Alternate planning, Ecology.
Identifiers: *Environmental Impact Statements, National Environmental Policy Act.

This report evaluates guidelines for Environmental Impact Statements established by the Council on Environmental Quality as tools for continuing the policy of the Federal Government to use all practicable means and measures in a manner calculated to create and maintain conditions under which man and nature can exist in productive harmony. These guidelines are based on the premise that everything on earth affects everything else, directly or indirectly. Nothing operates in isolation. Ecological-environmental research should be commenced even before projects are conceived. This research should be conducted from the holistic viewpoint to determine the overall long-range environmental repercussions of any project. The '3E's' (engineering, ecology and economics) should be considered as a unit, mutually supportive of one another. Potential alternative sites and alternative means of accomplishing projects should be objectively evaluated so that the project can be accomplished with minimal adverse environmental effects. (See also W76-06555) (Nursey-Florida)

FEDERAL ENVIRONMENTAL IMPACT STATEMENTS--A CASE STUDY,
Army Engineer District, St. Paul, Minn.
R. F. Post.
In: Minnesota Water Resources Research Center, Bull 78, p. 11-28, January 1975. 18 p, 2 map, 1 tab, 2 chart.

Descriptors: *Environmental effects, *Decision making, *Cost-benefit analysis, *Project planning, Economics, Evaluation, Conservation, Engineering, Environmental engineering, Environmental control, Balance of nature, Economic justification, Social impact, Economic feasibility, Economic impact, Social values, Pollutants, Water pollution effects, Pollution abatement, Alternate planning, Federal government, Turbidity.
Identifiers: *Environmental Impact Statement.

This report discusses Environmental Impact Statements prepared by the Corps of Engineers for two separate projects. These case studies are used to illustrate the procedure followed by the Corps of Engineering in preparing Environmental Impact Statements. The author states that in preparing these statements, the Corps attempts to develop proposals to balance the environmental development needs of the nation. The Corps considers the following factors: the possible detrimental effects of the proposed project on the environment of the area; the costs and impact of various alternative methods of carrying out the project; the costs to be incurred and benefits to be received from the economic and social effects of the proposed project. After considering all of these factors, the Corps must then make a final determination whether to recommend approval or disapproval of the proposed project. (See also W76-06555) (Nursey-Florida)
W76-06557

ENVIRONMENTAL IMPACT STATEMENTS/ENVIRONMENTAL POLICY ACT--LEGISLATIVE INTENT,
Minnesota State Senate, St. Paul.
W. Borden.
In: Minnesota Water Resources Research Center, Bull 78, p. 29-35, January 1975. 6 p.

Descriptors: *Minnesota, *Project planning, *Environmental effects, Economics, Evaluation, Conservation, Decision making, Engineering, Environmental engineering, Pollutants, Pollution abatement, Economic impact, Social impact, Legislation, Social values, Ecology, Environmental control, State governments, Federal government.
Identifiers: *Environmental Impact Statement, *State policy, National Environmental Policy Act, Chapter 412 of Minnesota Laws of 1973, Injunctions(Prohibitory).

This report discusses the legislative intent of Chapter 412 of Minnesota Laws 1973. The stated purposes of the law are: (1) to declare a state policy that will encourage productive harmony between man and his environment; (2) to promote efforts that will prevent or eliminate damage to the environment; and (3) to enrich the understanding of ecological systems and natural resources important to the state or nation. The author states that it is the intent of the law to force developers and governmental units to seriously consider the immediate and future social, economic and environmental impact of proposals, to insure public input, and to provide a procedure for evaluating, and if necessary, halting injurious projects. The intent of this law can be carried out through the use of Environmental Impact Statements, public hearings on draft statements, and enforcing permit refusals with the necessary court action to enjoin construction of disapproved projects. The author concludes that this system is not state land use planning in disguise; the system allows local initiative, but places environmental checks on it. (See also W76-06555) (Nursey-Florida)
W76-06558

MINNESOTA ENVIRONMENTAL IMPACT STATEMENTS--A USERS VIEWPOINT,
Minnesota Univ., Minneapolis. Water Resources Research Center.
G. C. Hite.
In: Minnesota Water Resources Research Center Bulletin 78, p. 43-54, January 1975. 12 p.

Descriptors: *Minnesota, *Project planning, *Economic impact, *Costs, State governments, Federal government, Environmental control, Legislation, Environmental engineering, Investment, Social impact, Economics, Profit, Capital costs, Financing, Conservation, Environmental effects.
Identifiers: *Environmental Impact Statement, *Minnesota Environmental Policy Act, National Environmental Policy Act.

This report discusses the effects of state environmental impact statements requirements on the land development business in Minnesota. The author states that due to environmental restrictions, many excellent development sites will no longer be available for construction. Sites that will be available are expected to cost significantly more. The author also states that because many of the new review areas are susceptible to a highly subjective judgement analysis, there is an increased uncertainty about public approval of the proposal. Both of these factors will lead to increased land development costs and the possibility of a decrease in return on investment. The author further states that the Minnesota requirements will give a competitive advantage to those companies which have developed in the environmental sciences. The author, however, generally praises the Minnesota Environmental Impact Statement requirements for eliminating or modifying many of the problem areas of the federal law. The author concludes that environmental consciousness is maturing in this country and that good business practices and good environmental practices are consistent and should be mutually supportive. MINNESOTA ENVIRONMENTAL IMPACT STATEMENT REQUIREMENTS,
Minnesota Univ., St. Paul. Council on Environmental Quality.
J. Mohr.
In: Minnesota Water Resources Research Center, Bull 78, p. 36-42, January 1975. 7 p.

Descriptors: *Minnesota, *Project planning, *Decision making, *Environmental effects, Economics, Evaluation, State governments, Federal government, Legislation, Conservation, Engineering, Environmental engineering, Pollution abatement, Cost-benefit analysis, Economic impact, Social impact, Social values, Environmental control, Economic justification, Alternate planning.
Identifiers: *Environmental Impact Statement, *Minnesota Environmental Policy Act, National Environmental Policy Act.

This report discusses the Minnesota environmental impact statement process. Although the Minnesota Environmental Policy Act is modeled after the National Environmental Policy Act of 1969, the impact statement requirements in the Minnesota Act go beyond the requirements of the Federal Act. The Minnesota Act requires preparation of Environmental Impact Statements on 'major public actions with the potential of significant environmental effects' or 'major private actions of more than local significance with the potential for significant envionmental effects'. The law also provides for a procedure whereby persons can petition for the requirement of an impact statement on a given project. The Environmental Impact Statements must include: (1) a description of the project; (2) the environmental impact of the proposed project, including a description of the resources in the area that will be affected, any direct or indirect environmentl, economic and employment effects and any irreversible and irretrievable commitments of resources that would be involved; (3) alternatives to the proposed project; (4) impact on state government of any federal controls associated with the proposed project; (5) the multi-state responsibilities associated with the proposed action; and (6) organizations and persons consulted. (See also W76-06555) (Nursey-Florida)
W76-06560

ENVIRONMENTAL MANAGEMENT FOR THE METROPOLITAN AREA CEDAR-GREEN RIVER BASINS, WASHINGTON, PART II: URBAN DRAINAGE.
Army Engineer District, Seattle, Wash.
December 1974. 107 p, 75 fig, 24 tab, 160 ref, glossary. DACW 67-76-C-0002.

Descriptors: Planning, *Non-structural alternatives, Water management(Applied), *Drainage systems, Water resources, Social impacts, *Environmental effects, Government, *River Basin Development, Land management, *Comprehensive planning, *Urban drainage, Storms, Runoff, *Washington, Legislation, Zoning, Land use.
Identifiers: Green River(WA), Cedar River(WA), River Basin Coordination Committee(RIBCO), Seattle(WA).

This report contains the results of the overall study and establishes the basis for the study recommendations. A coordinated basin-wide approach to storm water management is recommended in order to protect and preserve the area streams in as natural a state as possible. A drainage plan detailing the combination of control methods suitable for the regional sub-basins and including a procedure for implementation should be worked out. Opinions of citizens in each subbasin should be reflected in the plan. A common set of guide lines, permit procedures and drainage management requirements should be developed for the two counties. An equitable service charge should be the primary source of funds with State and Federal funds considered as additional sources where available. Construction of the 31 drainage facilities listed is recommended only after additional detailed design and coordinated planning are completed. Open natural drainage, wet lands and holding ponds should be preserved wherever practical. Flood plain zoning and site development ordinances should be used to control drainage and runoff. The study includes the River Basin Coordinating Committee, the environmental management program, the study area, environmental problems related to urban drainage, basis and methodology used for development of alternative plans, community involvement, and jurisdictional and financial aspects. (Hufschmidt - North Carolina)

KANEOCHE ALTERNATIVES: AN APPLICATION OF IMPACT METHODOLOGY.
Hawaii Environmental Simulation Lab., Honolulu. Available from the National Technical Information Service, Springfield, Va 22161 as PB-240 736, $5.50 in paper copy, $2. 25 in microfiche. Prepared for the National Science Foundation, Washington, D.C. 1974. 134 p, 1 fig, 10 tab, 32 plates, 17 ref. GI-36224.

Descriptors: Planning, *Non-structural alternatives, *Alternative planning, *Future planning(Projected), Model studies, Projections, Social aspects, Environmental effects, *Urban drainage, Urbanization, *Land use, Growth rates, Water resources development, Water quality, Water distribution, *Hawaii, Methodology.
Identifiers: *Kaneoche Bay(HI), Oahu(HI).

This report represents a broad range of information related to alternative futures for the Kaneoche Bay region in northeastern Oahu Island, Hawaii. The study develops, improves and demonstrates a variety of planning methods of environmental assessment useful to evaluate consequences of urban growth. Based on different assumptions about the type, pace and scale of urban development, three scenerios are projected for 1995: (1) assume the existing general plan for the region guides development; (2) private developers plans indicate land use change; and (3) limits to those areas which appear environmentally suitable for urbanization. An overview of the study area is presented, followed by an analysis of the environmental impact of the alternative policies on urban land and water resources uses. Carrying capacity overload capacity and need to retain flexibility and adaptability in planning tools serve as evaluative criteria for the scenerios. Simulation models representing a wide diversity of geographic hydrologic and site development factors were developed to project possible environmental consequences. These models included Small Watershed Peak Discharge Model, Universal Soil Loss Equation, Sewer Alignment Model and Sewer Network Volume/Capacity Model. Water problems were identified to be water distribution and water quality. Each scenerio provides alternatives for waste water treatment, flood protection and water distribution and measures their costs. Community interaction and social impact assessment of each scenerio are discussed. (Salzman - North Carolina)

AN ASSESSMENT OF THE EXPECTED IMPACT OF A DREDGING PROJECT PROPOSED FOR PALA LAGOON, AMERICAN SAMOA,
Hawaii Univ., Honolulu. Sea Grant Program.
P. Helfrich, J. L. Ball, Jr., P. Bienfang, M. Foster, and B. Gallagher.
UNIHI-SEAGRANT-TR-76-02, October 1975. 76 p, 18 fig, 7 tab, 49 ref, 5 append, $2.50. Grant 2-35243.

Descriptors: *Dredging, Environment, *Environmental effects, Channel improvement, Aquatic life, Aquatic environment, Biota, Ecosystems, Biology, Ecology, Marine biology, Lagoons, *Social impact, *Economic impact, Pacific Ocean, Water pollution effects.
Identifiers: *Pala Lagoon(American Samoa).

Biological and socio-economic effects are assessed of a dredging project proposed for Pala Lagoon, American Samoa. Emphasis is placed on the expected impact the project would have upon the tides and circulation, bacterial contamination, phytoplankton productivity, coral and echinoderms, and fishes of Pala Lagoon. The data collected indicate that dredging would remove an existing sill and, although the volume flow through the entrance channel would be increased, the turbulent mixing process between ocean and lagoon would be decreased, and, as a result, the average residence time of water in the lagoon would be increased. Since the dredging is not believed to enhance the effective tidal dilution, this project is not expected to improve the microbial quality of the lagoon. Any perturbations affecting the coral (such as dredging) can be expected to have a profound effect on the rest of the community for an extended period. Increased residence time of water in the lagoon, caused by dredging, would be detrimental to delicate fish larvae. (NOAA)

7. RESOURCES DATA

7A. Network Design

REMOTE SENSING OF RESOURCES IN ARID LANDS,
Arizona Univ., Tucson. Office of Arid Lands Studies.
. D. Johnson, L. K. Lepley, and K. E. Foster.
Proceedings in: International Seminar on Land Evaluation in Arid and Semi-Arid Zones of Latin America, Rome, February 4-7, 1974. p. 65-77 1975, 4 ref.

Descriptors: *Remote sensing, *Arid lands, Satellites(Artificial), *Water resources, Mapping, Arizona, Resources, Aerial photography, Infrared radiation, Radar, Terrain analysis, Surveys, Hydrology, Vegetation, Land use, Fossil fuels, Natural resources, Photography, Computers.
Identifiers: Tortolita project(Ariz), Composite computer mapping.

Increasing population pressures in congested areas have led to new interest in sparsely populated arid lands. This interest is largely due to advances in water technology that may greatly change a capacity of deserts to support more people. Remote sensing, the science of acquiring information through devices such as cameras, radar, lasers, thermal infrared sensors, and other instruments remote from that which is being measured should lead to better resource management and inventory techniques. Management of arid lands resources requires a 3-step process: inventory, analysis, and operations or development. Aspects of remote sensing as they apply to arid land resource inventory are discussed. Photographic capabilities (including multiband photographs, multidate photographs, and multistage photographs) of the Earth Resources Technology Satellite (ERTS) are reviewed. Major resource applications of remote sensing include hydrology and water resources, vegetation, soil resources, minerals and fossil fuels, marine resources, land use, and land use ghanges. The use of computer mapping as a data handling technique in conjunction with remote sensing is discussed. A brief description of the Tortolita project in Arizona is included. The composite computer mapping technique is described in 3 steps: (1) select relevant factors, (2) construct functional groups and assign weights, and (3) assign weights to individual factor maps. (Robinett-Arizona)
W76-06260

DATA COLLECTION SYSTEMS AND THEIR IMPACT ON THE FUTURE DEVELOPMENT OF HYDROLOGY,
Department of the Environment, Reading (England). Water Data Unit.
J. C. Rodda.
Water Services, Vol. 79, No. 947, p 10-15, January 1975. 5 fig, 26 ref.

Descriptors: *Data storage and retrieval, *On-site data collections, *Satellites(Artificial), *Remote sensing, Hydrology, *Hydrologic data, *Data collections, Automatic control, Compute models, Simulation analysis, Water resources, Snow surveys.
Identifiers: Delaware River Basin(MD), Thetford Forest(United Kingdom).

Some recent advances in hydrolog are examined. Integrated data collection systems are becoming more frequent, yet these systems range in complexity from single measuring devices which continuously measure a single variable to systems which record vast amounts of information over wide areas and transmit to one or more bases. Examples are cited. (1) In the Thetford Forest (United Kingdom) a project is being undertaken to establish the evaporative characteristics of Scots pine through the use of a computer-controlled data acquisition system and simulation model. Thirty meter towers carry pairs of aspirated quartz crystal, wet and dry bulb thermometers, anemometers and wind vanes. The computer collects observations from 110 sensors and lists hourly averages and draws profiles. (2) Snow surveys are being made by satellite to determine extent, depth, and water equivalent of snow. By using infared sensors and photographs, on flat terrain extent of snow could be determined within 20 km and mountainous terrain within 150-200 m. (3) In order to predict stream flow following rainfall, radar is being used to continuously monitor a water basin in the United Kingdom. The radar information is calibrated through the use of a computer model. Flow forecasts are highly accurate. (4) In the Delaware River Basin (MD) satellite-based collection is supplementing more traditional data collection methods to give data on water quantity, dissolved oxygen, temperature, conductivity and pH. Five aspects of systems and data are becoming crucial: reliability, representativeness, impartiality, relevance, and continuity. During the next several decades it is likely these systems will be consolidated. (Smith - North Carolina)

7B. Data Acquisition

BULK DENSITY SAMPLER FOR DEEP SOIL PROFILES,
California Univ., Riverside.
K. M. Holtzclaw, J. M. Rible, and P. F. Pratt.
Soil Science Society of America Proceedings, Vol. 39, No. 6, p 1220-1223, November-December 1975. 4 fig, 2 tab, 3 ref. NSF GI 34733X.

Descriptors: *Sampling, *Bulk density, *Instrumentation, *Soils, *Soil profiles, Drilling, Drilling equipment, Fertilizers, Irrigation, Salts.
Identifiers: *Deep soil profiles, Soil samples, Drilling unit, Soil core method, Soluble ions, Bucket augur.

A bulk density sampler, adapted from a conventional commercial type, was constructed and used to obtain soil samples at more than 50 sampling sites from depths to 30 m. This sampler increased the speed with which samples were taken because it was readily added to or detached from the drilling unit between sequences of drilling. Evaluations showed that the sampler obtained bulk density values quite comparable to those found with an undisturbed soil core method. (Roberts-ISWS)

THE ECONOMIC VALUE OF REMOTE SENSING OF EARTH RESOURCES FROM SPACE: AN ERTS OVERVIEW AND THE VALUE OF CONTINUITY OF SERVICE. VOLUME IX. OCEANS.
Econ, Inc., Princeton, N. J.
Available from the National Technical Information Service, Springfield, Va 22161 as N75 14214, $6.00 in paper copy, $2.25 in microfiche. National Aeronautics and Space Administration, Report NASA-CR-141270, December 1974. 133 p. 8 fig., 17 tab. NASW-2580

Descriptors: *Economic impact, *Benefits, *Remote sensing, *Resources, *Oceans, Oceanography, Satellites(Artificial), Weather forecasting, Marine plants, Polar regions, Data collections, Fish management, Mapping, Conservation, Ice, Navigation, Forecasting, Tides, Hurricanes, Currents(Water), Oil pollution, Marine fisheries, Navigation, Coasts, Shore protection, Water pollution control, Estuaries, Law enforcement, Regulation, Monitoring, Legal aspects, *Marine resources, Coastal zone management.

Satellite imagery permits study to a depth of about sixty meters below the ocean surface, the part of the sea which most affects mankind and which he most affects. Almost all important ocean parameters can be sensed from satellites or communicated via satellite using Data Collection Platforms. Satellite imagery is valuable in mapping oceans, ice and polar caps, and water temperature; monitoring food supplies, tides, currents, and oil slicks; optimizing ocean fisheries management and shipping routes; improving coastal zone management and shoreline protection; controlling ocean pollution; and reducing loss of ocean resources due to man-made changes. Remote sensing enhances research on ocean parameters and estuarine ecology. It can be used to design and enforce national and international regulations and agreements. Cost-saving benefits are quantified and user demand for information identified; unquantified benefits are significant. The primary factor making quantification difficult is that the information obtained will be of greatest benefit as input to forecasting models which are yet to be constructed. Applicable federal budgets for specific agencies and laws and statutes governing remote sensing of oceans are summarized. Hard benefits would range from $6.78-17.04 million. TRANSMISSOMETER MEASUREMENTS OF THE GREAT LAKES,
Canada Centre for Inland Waters, Burlington (Ontario).
K. P. B. Thomson, and J. Jerome.
Scientific Series No. 53, 1975, 10 p, 13 fig, 6 ref.

Descriptors: *Measurements, Investigations, *On-site investigations, Surveys, *Monitoring, Data collections, Limnology, Analysis, *Great Lakes, Instrumentation.
Identifiers: *Transmissometer.

Beginning in 1973 in situ measurements of the optical beam attenuance or transmittance have been obtained on the Great Lakes during the CCIW monitoring cruise program. The instrument used for these measurements and the operational procedure are described. Sample data from each cruise are presented for reference purposes. The transmittance or attenuance data for Lakes Superior, Erie and Ontario are described in terms of their relation to other limnological parameters. Relations observed in the analyses of the optical data show that the beam transmittance or attenuance is an important limnological parameter for the surveillance of the Great Lakes. A COMPARISON OF THE RESPONSES OF IDENTICAL CUP ANEMOMETERS MOUNTED ON A SPAR AND A TOROID BUOY,
Oregon State Univ., Corvallis. School of Oceanography.
W. V. Burt.
Journal of Physical Oceanography, Vol. 5, No. 4, p 789-792, October 1975. 4 fig, 13 ref. NSF OCD71-00271 A05.

Descriptors: *Anemometers, *Winds, *Instrumentation, Buoys, Waves(Water), Statistical methods, Wind velocity, Oceans.
Identifiers: *Errors, Standard deviation, Spar buoys, Toroid buoys.

In experiments with identical cup anemometers, one mounted on a spar buoy and one mounted on a toroid buoy that were anchored close together, the anemometer mounted on the toroid indicated consistently higher 10-min integrated averages of wind speed than the cup anemometer mounted on the spar buoy. The difference was 7% of the mean wind speed and was linear over a range of mean wind speeds from 1.5 to 9.5 m/s. (Jones-ISWS)

OPERATIONAL CHARACTERISTICS OF THE DECCA LAMBDA (6F) POSITIONING SYSTEM OVER FRESH WATER,
Canadian Hydrographic Service, Ottawa (Ontario).
F. L. DeGrasse, and P. Brunaus.
IFYGL Tech. Man. No. 7; (1975), 52 p.

Descriptors: *Lakes, *Lake Ontario, *Navigation, *Electromagnetic waves, Radio waves.
Identifiers: Radio wave propagation, Phase lag, DECCA Lambda positioning system.

Establishment of the DECCA Lambda (6f) positioning system for the International Field Year Great Lakes study of Lake Ontario and Basin provided an opportunity to evaluate the equipment in the hyperbolic mode and more importantly to determine phase lag effect on electromagnetic waves in a fresh water environment. A number of calibrations/evaluations were carried out throughout the Field Year under varying meteorological and land-sea media conditions to determine a more accurate figure for Velocity of Propagation of radio waves over fresh water and its application to electronic positioning in similar fresh water bodies. The bathymetric survey of Lake Ontario will be accounted for in some detail together with the automated collecting, processing and portrayal of the data. This survey is the first major effort at metrication in the Great Lakes. (NOAA)

This atlas provides a graphic representation of the resources of Arizona. It contains maps of the state's rainfall, drainage areas, river flow, selected groundwater wells, average temperatures, climate, vegetation, general geology, soils, relief, physiographic cross sections, land ownership, and land utilization including crop distribution and irrigated areas, the Central Arizona Project, and recreational areas. An emphasis is placed on maps that are readable by all segments of society. Also included is a bibliography of Arizona maps. (Robinett-Arizona)

COMPUTERIZED MONTHLY REPORTS, COST-EFFECTIVE ALTERNATIVE,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
F. A. DiGiano, R. J. DuPuis, and P. J. Williams.
Water and Sewage Works, Vol. 122, No. 12 p 49-53, December, 1975. 5 fig, 2 tab.

Descriptors: *Waste treatment, Treatment facilities, Waste water treatment, Monitoring, Costs, *Computer programs.
Identifiers: Pilot tests, Cost-effectiveness.

An optical scanning form and computer program, DTECTR (Diagnostic Testing of Efficiency by Computerization of Treatment Reports), have been developed to record, review, evaluate and store monthly operational data from waste water treatment plants. Operators at eight waste treatment plants in Massachusetts will soon participate in a pilot testing program of DTECTR. The computer program will evaluate plant operations rapidly, store data, make the operational data easily accessible to engineers and regulatory agencies, provide flexibility for expansion of data evaluations, and reduce staff time normally spent compiling such information. The system, developed by the University of Massachusetts Division of Water Pollution Control, includes an optical scanning form to be filled out by the plant operator. Space is provided for recording the following daily data: rain, flow, sludge recycle, dissolved oxygen, pH, chlorine residual, settleable solids, total coliform, fecal coliform, phosphorus and nitrogen in final effluent, suspended solids, BOD, and sludge settleability. Estimates of cost indicate that implementation of DTECTR by one state regulatory agency would result in a cost of $341 per month in contrast to $600 per month as required for present staff data analysis. WATER QUALITY DATA ALBERTA 1961 - 1973.
Department of the Environment, Ottawa (Ontario). Inland Waters Directorate; and Department of the Environment, Ottawa (Ontario). Water Quality Branch.
1975. English and French language versions.

Descriptors: *Water quality, *Data collections, *Physical properties, *Biological properties, Water, Oxygen, Nitrogen, Calcium, Methodology, Alkaline water, Heavy metals, *Canada.
Identifiers: *Alberta.

Tables on water quality data in Alberta from 1961 to 1973 are presented. This report is one of a series covering the major regions of Canada. These compilations of approximately 10 years data are an extension of the water survey reports of the industrial water resources of Canada, a monitoring program which began in 1947. (Environment Canada)
W76-06374

SEDIMENT DATA, CANADIAN RIVERS 1972.
Department of the Environment, Ottawa (Ontario). Applied Hydrology Div.
Inland Waters Directorate, Water Survey of Canada, 1975, 328 p.

Descriptors: *Sediments, *Rivers, *Data collections, *Canada, Reservoirs, Canals, Erosion, Hydrology, Geomorphology, Streamflow, Drainage, Ditches, Fish, Habitats.

Tables of sediment data on Canadian rivers are presented. These tables contain data on streamflow, daily suspended sediment discharges, daily mean suspended sediment concentration, particle-size distribution of suspended sediment, particle-size distribution of bed load, particle-size distribution of bed material, and water temperature. (Environment Canada)
W76-06376

SURFACE WATER DATA, REFERENCE INDEX, CANADA 1975.
Canada Centre for Inland Waters, Burlington (Ontario); and Department of the Environment, Ottawa (Ontario). Water Resources Branch.
Surface Water Data, 1975, 276 p. English and French language versions.

Descriptors: *Surface waters, *Surveys, *Data collections, *Canada, Rivers, Sediments, Stations, Lakes, Drainage area, Hydrometry, Gaging stations, Telemetry, Temperature, Codes, Collections.

Hydrometric surveys are conducted by the Water Survey of Canada under various agreements with the provinces and territories. The main body of this index is a tabulation of stations showing station number and name, drainage area, gauge location, discharge records, type of gauge, operation schedule, and remarks. The names of rivers and lakes for which data are available are given in a station number index and an alphabetical index. (Environment Canada)

FLOOD-PRONE AREAS OF GADSDEN COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
R. P. Rumenik, C. A. Pascale, and D. F. Tucker.
Water-Resources Investigations 31-75, 1975. 1 sheet, 4 fig, 1 tab, 5 ref.

Descriptors: *Flood profiles, *Maps, *florida, Flood data, Flood peak, Flood discharge, Flood recurrence interval, Flood plains, Hydrologic data, Flood damage, Flood control.
Identifiers: Gadsden County(Fla).

The map of Gadsden County, Fla., provides a generalized reference for individuals interested in land use and development, for agencies formulating zoning regulations, and for insurance companies. The 100-year flood elevation is used for the national standard as the degree of protection needed when developing or considering development in flood-prone areas. Major flooding in Gadsden County occurred three times in less than 30 years. The most recent major flood was in September 1969 when more than 20 inches of rain fell in the Quincy-Havana area during a 3-day period. The maximum rainfall of record occurred at Quincy on September 21 when 10.87 inches of rain fell in six hours. Although no loss of life resulted from the flood, considerable damage did occur to cottages, mobile homes, roads, and bridges as flood levels exceeded the 100-year flood on most major streams in the county. Examples of flooding on the Little River at U. S. Highway 90 and the Ochlockonee River at State Highway 20 are shown. U. S. Highway 90 remained closed to traffic nearly 36 hours owing to structural damage to the Little River bridge. (Woodard-USGS)
W76-06443

THE LOWER WILCOX AQUIFER IN MISSISSIPPI,
Geological Survey, Jackson, Miss.
E. H. Boswell.
Water-Resources Investigations 60-75 (open-file report), February 1976. 3 sheets, 16 fig, 3 tab, 1 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water yield, *Water quality, *Mississippi, Hydrogeology, Water utilization, Water supply, Groundwater recharge, Withdrawal, Maps, Water level fluctuations, Projections.
Identifiers: *Lower Wilcox aquifer(Miss).

This 'atlas', the second in a series, describes the character, the potential, and the extent of development of the lower Wilcox aquifer in Mississippi. Sediments composing the Wilcox Group are exposed in a curving belt that extends from Lauderdale County to Tippah County. In much of the

area where the lower Wilcox aquifer contains fresh water, all deeper aquifers are saline. Although minor aquifers occur in the middle and upper parts of the Wilcox Group, the Meridian-upper Wilcox aquifer is the next shallower extensive source for large supplies of groundwater. The largest withdrawals of water from the lower Wilcox are made in Lauderdale County where nearly 7 mgd is plumped (1975). The total production from the aquifer in Mississippi in 1975 was about 16 mgd and was distributed over 25 counties. The water is mostly of the sodium bicarbonate type. The dissolved-solids concentration is very low in the outcrop area, and the rate of increase in mineralization with depth is small in most of the area. Chloride is likely to exceed 200 mg/l only when the dissolved-solids concentration exceeds 700 mg/l. (Woodard-USGS)
W76-06444

THE MIOCENE AQUIFER SYSTEM IN MISSISSIPPI,
Geological Survey, Jackson, Miss.
R. Newcome, Jr.
Water-Resource Investigations 46-75, December 1975. 3 sheets, 12 fig, 3 tab, 15 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Well data, *Water quality, *Mississippi, Hydrologic data, Hydrogeology, Alluvial aquifers, Water wells, Water yield, Water utilization, Groundwater recharge, Water analysis, Chemical analysis, Water temperature.
Identifiers: *Miocene aquifer system(Miss).

This report on the Miocene aquifer system in Mississippi is the first in a series dealing specifically with the statewide occurrence of individual aquifer systems. Most of the southern half of Mississippi is underlain by a series of irregular and locally lenticular sand and clay beds of Miocene age. Southwest of a line from Warren County on the west through Wayne County on the east, these sediments form a wedge that thickens gulfward and has its base about 5,500 ft below sea level at the southern tip of Hancock County. The beds dip gulfward at 30 to 100 ft/mi, the rate of dip being least in the near-surface zone. The Miocene aquifer system is the largest potential source of groundwater supplies in the State. In the 17,000 sq mi area of its occurrence it is currently tapped for about 120 Mgal/d, slightly more than one-fourth of the groundwater withdrawn in Mississippi for uses other than irrigation. Only the upper few hundred feet of the system have been significantly developed, and many thick aquifers remain unapped. The quality of the water is generaly good, he only substantial problem being excessive iron n places. (Woodard-USGS)
W76-06445

RAINFALL-RUNOFF DATA FROM SMALL WATERSHEDS IN COLORADO, OCTOBER 1971 THROUGH SEPTEMBER 1974,
Geological Survey, Denver, Colo.
G. L. Ducret, Jr., and H. E. Hodges.
Colorado Water Resources Basic-Data Release No 38, Colorado Water Conservation Board, Denver, 1975. 540 p, 2 fig, 3 tab, 12 ref.

Descriptors: *Rainfall-runoff relationships, Small watersheds, *Colorado, *Basic data collections, Stream gages, Rain gages, Streamflow, Computer programs.

All significant rainfall-runoff data collected in Colorado small watersheds from October 1971 through September 1974 by a network of gages are presented. Detailed records of rainfall and stream age are collected at each station by the operation f two digital recorders which code the data on 16-hannel paper tape at 5-minute intervals. Use of a ngle timer provides for simultaneous actuation of oth recorders. Detailed station-description infor-ation is included for every station in the study. A mputer program developed by the U.S. Geological Survey uses the stage-discharge relation at a gage to convert time and stage data into a printout of time versus discharge. Because the intakes to the gage wells are generally located above the bottoms of the stream channels, there is a flow rate at each station below which the discharges must be estimated to complete the hydrographs. WATER RESOURCES OF THE THRUST BELT OF WESTERN WYOMING,
Geological Survey, Cheyenne, Wyo.
G. C. Lines, and W. R. Glass.
For sale by USGS, Reston, Va. 22092; price $2.00 per set. Hydrologic Investigations Atlas HA-539, 1975. 3 sheets, 38 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater resource, *Water quality, *Wyoming, Water supply, Water utilization, Water yield, Consumptive use, Streamflow, Aquifers, Maps, Hydrographs, Contours, Thermal springs.
Identifiers: *Thrust belt(Western Wyo).

This atlas report describes the results of one of a series of water-resources reconnaissance studies of large areas in Wyoming by the U.S. Geological Survey in cooperation with the Wyoming State Engineer. The purposes of the study are to obtain a general knowledge of the occurrence, availability, and quality of groundwater and to summarize flow characteristics and chemical quality of water in major streams in the thrust belt of western Wyoming. The thrust belt is an elongate, nearly rectangular area of about 5,300 sq mi in the Middle Rocky Mountain physiographic province. The largest use of water in the area is for irrigation of alfalfa, grass hay, and pasture to complement livestock grazing on the vastly larger areas of forest and range land. In that part of the Bear River basin that is in Wyoming, an estimated 58,700 acres were irrigated in 1970 (Hunter and others, 1971); only about 2,000 acres of this total was irrigated with water from wells. Industrial water use in 1970 is estimated at 6 mgd with about 80 percent of the water derived from surface-water sources. Approximately two-thirds of the estimated 18,000 people that lived in the study area in 1970 were served by municipal water supplies in Afton, Cokeville, Evanston, Kemmerer, Jackson, and Thayne. Estimated use in 1970 by these municipal supplies was 5.4 mgd. Three areas of thermal-water discharge are known in the area. (Woodard-USGS)
W76-06448

PRELIMINARY HYDROGRAPHY AND HISTORIC TERMINAL CHANGES OF COLUMBIA GLACIER, ALASKA,
Geological Survey, Tacoma, Wash.
A. Post.
For sale by USGS, Reston, Va., 22092, price $1.75 per set. Hydrologic Investigations Atlas HA-559, 1975. 3 sheets, 14 ref.

Descriptors: *Glaciers, *Hydrography, *Mapping, *Movement, *Alaska, Discharge(Water), Climatology, Data collections, Monitoring, Aerial photography, Geomorphology.
Identifiers: *Columbia Glacier(Alaska), Historic terminal changes.

Data on 3 sheets of maps show that for more than 70 years Columbia Glacier's terminus in Alaska has been virtually stable, with frequent temporary advances being balanced retreats of the same magnitude. This stability is in marked contrast to other glaciers in the area, most of which have thinned and retreated during this interval, the only other notable exceptions being tidal glaciers which have previously made large-scale drastic retreats and which are currently advancing. Columbia Glacier's extended position and advances in recent decades over areas not glaciated for more than 9,000 years (J. H. Mercer, written commun., 1975) are anomalous. Very large embayments which form some years in the glacier's terminus cliff may present a serious hazard to the glacier's continued stability. Drastic retreat with associated increased iceberg discharge could occur within a few years should the glacier retreat from the shoals. These fluctuations at the terminus and changes in thickness in other parts of the glacier are being carefully monitored in order to predict the glacier's future stability. (Woodard-USGS)
W76-06449

PHYSICAL AND CLIMATIC CHARACTERISTICS ALONG KANSAS STREAMS,
Geological Survey, Lawrence, Kans.
C. V. Burns, D. V. Maddy, P. R. Jordan, and J. M. McNellis.
Kansas Water Resources Board Topeka, Streamflow Characteristics Technical Report No 13, January 1976. 41 p, 8 ref.

Descriptors: *Physical properties, *Channel morphology, *Climatic data, *Streams, *Kansas, Data collections, Streamflow, Drainage area, Water temperatures, Hydrologic cycle, Soil properties, Vegetation, Trees, Information retrieval, Computer programs.

Physical and climatic characteristics of streams are presented from data collected at gaging stations and other selected sites in and adjacent to Kansas. Examples of the 30 characteristics listed include main channel length, percent timber area, and 50-year 24-hour rainfall. Data are included for about 600 locations. Some of the data have been published in numerous reports some have remained in the files, and some have been updated as more information has become available. Data available have been compiled as part of a cooperative program between the Kansas Water Resources Board and the U.S. Geological Survey. The computer program (named WIDSAR) is written in Fortran IV and consists of a main program with two subroutines that control the processing and production of the tables desired. (Woodard-USGS)
W76-06450

WATER RESOURCES DATA FOR GEORGIA, WATER YEAR 1975,
Geological Survey, Doraville, Ga.
Water-Data Report GA-75-1, February 1976. 368 p, 4 fig, 5 tab, 32 ref.

Descriptors: *Basic data collections, *Surface waters, *Georgia, *Streamflow, *Water quality, Sediment transport, Gaging stations, Flow rate, Sampling sites, Water analysis, Chemical analysis, Water temperature, Lakes, Reservoirs, Water levels, Hydrologic data.

Water resources data for the 1975 water year for Georgia consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs. This report contains discharge records for 91 gaging stations; stage only records for one gaging station; stage and contents for 16 lakes and reservoirs water quality for 16 continuous stations and 78 periodic stations. Also included are 99 crest-stage partial-record stations and two low-flow partial-record stations. Additional water data were collected at various sites, not part of the systematic data collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Georgia. (Woodard-USGS)

GROUND-WATER IN NEW MEXICO, 1973,
Geological Survey, Albuquerque, N. Mex.
J. D. Hudson.
New Mexico State Engineer, Santa Fe, Basic-Data Report, 1975. 99 p, 32 fig, 62 tab, 47 ref.

Descriptors: *Groundwater resources, *Water level fluctuations, *Observation wells, *Basic data collections, *New Mexico, Well data, Aquifers, Precipitation(Atmospheric), Hydrographs.

Water levels were measured in a network of about 1,600 observation wells in 35 areas located within seven of the nine major surface-water drainage basins in New Mexico. Measurements were made in January or February 1974 and reflect water-level changes with measurements made in January or February 1973. Maps showing observation-well locations and water-level changes for 1973 are included for most areas. The water-level data are used by the U.S. Geological Survey and the State Engineer of New Mexico in evaluating the groundwater resources of the State. (Woodard-USGS)

Marine technical report 46, (1975), 92 p. NSF Grant OCD74-01739 401.

Descriptors: Computers, *Computer programs, *Data collections, Data processing, Data storage and retrieval, Charts, Statistics, *Time series analysis, Oceanography.
Identifiers: FORTRAN, *Physical oceanographic data, Time series data.

A group of FORTRAN programs written to display time series data, X-Y data, and the results of time series analysis are documented. Separate programs are used to plot variables on any combination of linear and logarithmic (base 10) axes. Originally written to plot physical oceanographic data, these programs may be used in wider applications due to their flexibility. Parameters which determine plot size, numbering and labelling of axes are user supplied variables. The data storage device and format are also supplied at execution time. All of these programs are stored in compiled form for use at URI. Listings are supplied in the appendices for other users. (NOAA)

PREVENTION AND CONTROL OF CULVERT ICING, SUMMARY REPORT ON STUDIES FY 1966-70,
Cold Regions Research and Engineering Lab., Hanover, N. H. Experimental Engineering Div.
K. L. Carey, R. W. Huck, and D. A. Gaskin.
Available from the National Technical Information Service, Springfield, Va 22161, as ADA-010 328, $5.00 in paper copy, $2.25 in microfiche. Special Report 224, April 1975. 79 p, 46 fig, 7 tab, 10 ref, 2 append.

Descriptors: *Ice, *Culverts, *Highways, *Alaska, Roads, Pipes, Channels, Channel improvement, Conduits, Drainage, Flow, Flow resistance, Flood control, Freezing, Thawing, Heating.
Identifiers: Electrical heating cables, Channel covers.

U.S. Army Cold Regions Research and Engineering Laboratory field inspections and data collection on icing conditions and methods of control prior to 1966 provided background to the overall study. A literature survey, covering primarily American and Russian experience, and a survey by questionnaire of highway maintenance forces in Alaska provided background to a field study of icing prevention and control covering four winter seasons in Alaska. Climatological, culvert temperature, ground temperature and hydrologic data were collected at Grenac, Steele and Flume Creeks near Fairbanks, Alaska, to extend understanding of icing phenomena. Field trials were conducted at Bear Creek, Grenac Creek, Steele Creek, Moose Creek and Gakona Spring to test three expedient techniques for controlling icing: electric heating cables, channel improvement and channel covers. Electric heating cables and channel deepening proved to be very promising for icing control, and improved installation and operating procedures for electric heating cables were developed during the study. The usefulness of channel covers proved to be rather restricted. Ground temperature data were collected from an array of thermocouples beneath and adjacent to a 24-in corrugated metal culvert at Mile 15 on the Elliott Highway to study the thermal regime surrounding an ice-flooded culvert. These data demonstrated that culvert ends were the critical regions of heat loss. (Sims - ISWS)

INFLATABLE WATER-RETAINING BARRIER,
Pneumatiques, Caoutchouc Manufacture et Plastiques Kleber-Colombes (France), (Assignee).
J. V. Ganzinotti.
U.S. Patent No. 3,928,980, 5 p, 12 fig, 6 ref; Official Gazette of the United States Patent Office Vol 941, No 5, p 2029, December 30, 1975.

Descriptors: *Patents, *Barriers, *Engineering structures, *Dams, *Diversion structures, Rivers, Channels, Flexibility.
Identifiers: Inflatable barriers.

An inflatable water-retaining barrier is made up of one or more flexible membranes forming the enclosure and are used to block a watercourse such as a river. The enclosures are all fastened to a rigid member which extends along the whole length of the enclosures and is intended to be supported by the bank of the water course. The rigid member such as a metal bar or tube prevents the enclosure from deforming longitudinally. Mechanical stresses exerted on the barrier are transferred to the rigid member and thus to the banks. To install such a barrier, it is sufficient to inflate it with air until it floats, to position it on the river upstream of the abutments, to let it be carried along by the current under guidance until the rigid member rests against the abutments or banks and then to let out the air and to fill it with water until it sinks. It is likewise very simple to remove the barrier. The water contained in the inflatable enclosure is expelled and replaced by air, which buoys it and the rigid member up to the surface of the water. MENABREA'S NOTE ON WATERHAMMER: 1858,
Aberdeen Univ. (Scotland). Dept. of Engineering.
A. Anderson.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY1, Proceedings Paper 11831, p 29-39, January 1976. 1 tab, 27 ref, 3 append.

Descriptors: *Hydraulics, *Hydraulic trasients, *Closed conduits, *Pressure conduits, Pipe flow, *Water hammer, Flow, *History, Fluid mechanics.
Identifiers: *Energy analysis.

The earliest analysis of waterhammer is frequently attributed to Jules Michaud in 1878, but in 1858 the Italian engineer, L.F. Menabrea, published a short note on the calculation of water pressures. This little known contribution is, for its time, a remarkable and innovative study, introducing the technique of energy analysis and describing the phenomenon with singular clarity. As it thus appears to deserve wider recognition in the history of waterhammer, the note was translated and an explanatory introduction was provided. The introduction was intended: (1) to demonstrate how close Menabrea came to the derivation of the formula generally attributed to Joukowsky, (2)to pinpoint the errors and failures in his analysis, and (3) to examine briefly the reception at the turn of the century of the ideas he first proposed some 40 years earlier. (Morris - ISWS)

SKIN FRICTION IN UNSTEADY LAMINAR PIPE FLOW,
Universidad Tecnica del Estado, Santiago (Chile).
M. F. Letelier, and H. J. Leutheusser.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY1, Proceedings Paper 11867, p 41-56, January 1976. 10 fig, 9 ref, 2 append.

Descriptors: *Hydraulic transients, *flow resistance, *Boundary processes, *Closed conduits, Head loss, Flow, *Pipe flow, Analysis, Laminar flow, Unsteady flow.
Identifiers: Flow patterns, *Friction coefficient, Oscillation, Time dependence.

The routine approach toward solving problems of unsteady pipe flow utilizes either the concept of a constant friction coefficient, or the model of quasi-steady flow. These two hypotheses were tested using exact analytical solutions and corroborating experimental evidence for two cases of time-dependent laminar pipe flow: (1)The establishment of Poiseuille flow and (2)U-tube oscillations. It was shown that neither of the simplifying assumptions corresponds to reality, and that both tend to severely underestimate the frictional resistance. It was suggested that similar conclusions may also pertain to unsteady turbulent pipe flow. (Morris - ISWS)

WAVE FORCES ON BOTTOM-MOUNTED LARGE-DIAMETER CYLINDER,
Naval Postgraduate School, Monterey, Calif. Dept. of Mechanical Engineering.
C. J. Garrison, F. H. Gehrman, and B. T. Perkinson.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 101, No. WW4, Proceedings Paper 11699, p 343-356, November 1975. 4 fig, 10 ref, 2 append.

Descriptors: *Harbors, *Hydrodynamics, *Pipelines, *Waves(Water), *Dynamics, Testing, Dimensional analysis, Pressure, Regression analysis, Strain gages, Uplift pressure.
Identifiers: *Underwater pipeline, Inertia force, Wave height.

A systematic series of tests were conducted to determine the horizontal and uplift forces acting on a bottom-mounted horizontal circular cylinder. The maximum value of horizontal force tended to vary linearly with wave height for the test range of 15 to 120 for the ratio of the square of wave period to water depth. The uplift forces comprise two components, dynamic lift and an inertia part. The latter can be represented by Froude-Krilov force. The maximum uplift force generally occurred at the wave trough where the inertial and dynamic components are additive. The uplift force is primarily attributable to the dynamic lift and is dependent on the lift coefficient which is in turn dependent on the relative magnitude of the particle displacement. As the wave height increases, a point is reached where gross flow separation and corresponding reduction in lift coefficient occurs. (Singh-ISWS)

STATISTICS OF RANDOM WAVE FIELD,
Worley Engineering Inc., Houston, Tex.
K. Pajouhi, and C. C. Tung.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 101, No. WW4, Proceedings Paper 11734, p 435-449, November 1975. 5 fig, 10 ref, 2 append.

Descriptors: *Coastal engineering, *Gravity waves, *Free surfaces, *Probability, *Fluid mechanics, Statistical methods, Pressure, Velocity, Analytical techniques, Interfaces.
Identifiers: *Random wave field, Dynamic pressure, Spectrum analysis.

In the case of random sea waves, the statistical properties of fluid motion are quite different for the cases with and without the free-surface fluctuations phenomenon. Expressions of the probability density function, covariance function and sprectrum of dynamic pressure, and vertical and horizontal components of fluid particle velocity in a random wave field were derived with due consideration given the free surface fluctuations phenomenon. The waves were assumed to be unidirectional, stationary, Gaussian, and in deep water. An incompressible inviscid fluid and irrotational motion were assumed. The study indicated : (1) dynamic pressure and fluid particle velocities are all non-Gaussian, (2) dynamic pressure and horizontal velocity possess nonzero means and are skewed, (3) approximate spectra of dynamic pressure and velocity components compare favorably with exact solutions, and (4) the effects of free surface fluctuations on all the quantities examined are most pronounced for points above and around the mean water level. (Singh-ISWS)

LARGE WAVE TANK TESTS OF RIPRAP STABILITY,
Coastal Engineering Research Center, Fort Belvoir, Va.
J. P. Ahrens.
Available from the National Technical Information Service, Springfield, Va. 22161 as AD-A012 792, $4.00 in paper copy, $2.25 in microfiche. Technical Memorandum No. 51, May 1975. 41 p, 21 fig, 6 tab, 10 ref, append.

Descriptors: *Slope protection, *Slope stability, *Slope stabilization, Waves(Water), Riprap, Embankments, Banks, Slopes, Laboratory tests, Coastal engineering, Bank protection, Bank stabilization.
Identifiers: *Large wave tank tests, *Riprap stability, Riprap weight, Wave period, Breaker characteristics, Riprap layer thickness, Filter stone size.

Tests of riprap stability under wave attack were conducted at prototype scale in the large wave tank at the U.S. Army Coastal Engineering Research Center (CERC). Wave heights ranging from 1.4 to 6 feet and wave periods ranging from 2.8 to 11.3 seconds were used. Three embankment slopes, 1 on 2.5, 1 on 3.5, and 1 on 5, were tested. The riprap stone was a diorite placed on the embankments by dumping. The median stone weights of the riprap ranged from 27 to 120 pounds. The study showed that wave period, because of its influence on breaker characteristics, has a significant effect on riprap stability. Wave conditions which produce the lowest riprap stability were predictable and were associated with a collapsing-type breaker. For the most dangerous wave conditions, the average stability coefficient was 2.70 for a 1 on 2.5 slope, 2.36 for a 1 on 3.5 slope, and 2.11 for a 1 on 5 slope. (Lee-ISWS)

ADVANCES IN HYDROSCIENCE, VOLUME 10-1975.
Academic Press, New York, New York, 1975. 414 p.

Descriptors: *Groundwater, *Model studies, *Tides, *Tidal waters, *Porous media, *Heat transfer, *Weirs, *Flow control, Theoretical analysis, Mathematical models, Aquifers, Hydraulics, Flow measurement, Flow characteristics, Equations, Geothermal studies, Numerical analysis, Subsurface waters, Oceans, Aquifer characteristics, Water measurement.

This volume contains four relatively long articles. (1) 'Modeling Techniques for Groundwater Evaluation' were outlined under the groups of analogs, analytical and numerical techniques, and sand tank models. Regional groundwater resource evaluation was emphasized. (2) 'Tidal Theory and Computations' dealt with tidal theory developed since 1964 for analysis of tides, tidal equations, and tidal computations. (3) 'Hydrothermal Convection in Saturated Porous Media' summarized the theories involved. The subject matter will be of great importance to problems such as groundwater pollution, exploration of geothermal energy and oil reservoirs, and constructions in cold regions. (4) 'Theory of Weirs' provides an advanced theoretical analysis of the hydraulics of many types of weirs used for flow measurement and flow control. This analysis will benefit designers and users of such hydraulic structures for water resources development. (See W76-06413 thru W76-06416) (Humphreys-ISWS)

THEORY OF WEIRS,
Indian Inst., of Science, Bangalore. Dept. of Civil Engineering.
N. S. L. Rao.
In: Advances in Hydroscience, Volume 10-1975. Academic Press, New York, New York, p 309-406, 1975. 60 fig, 7 tab, 192 ref.

Descriptors: *Weirs, *Flow control, *Flow measurement, *Discharge(Water), *Hydraulic structures, Theoretical analysis, Equations, Shape, Flow characteristics, Flow rates, Discharge coefficient, Measurement, Overflow, Open channels, Hydraulics, Water measurement, Flowmeters, Spillway crests, Flumes, Velocity, Profiles.
Identifiers: *Weir characteristics.

The term weir includes structures such as the depression in the side of a tank, a reservoir, or a channel for passing surplus water, and overflow structures such as a spillway for a dam. This paper involved only the hydraulics of weirs and was limited to flow measurement and control aspects. Specific subject area covered included: (1)channel conditions, weir characteristics, and liquid properties affecting flow over weirs; (2)rectangular and nonrectangular sharp-crested or thin plate weirs; (3)different cross-sectional profile shapes and different longitudinal profile shapes for broad-crested or finite crest width weirs; (4)terminal weirs; (5)end depth characteristics in rectangular and nonrectangular channels for zero height weirs; (6)theorems on proportional weirs, and proportional weirs for flow measurement and flow control; (7)throated flumes with and without humps for flow measurement; (8)v-shaped and labyrinth weirs; and (9)the effects of error, sensitivity, and standardization procedures of accuracy of measurements. The results of this study presented in tables, graphs, and equations will benefit designers and users of weirs for water resources development. (See also W76-06412) (Humpreys-ISWS)

CONTROLLING RESERVOIR TRAP EFFICIENCY,
Agricultural Research Service, Columbia, Mo. North Central Watershed Center.
D. L. Rausch, and H. G. Heinemann.
Transactions of the American Society of Agricultural Engineers, Vol. 18, No. 6, p 1105-1113, November-December 1975. 6 fig, 2 tab, 5 ref.

Descriptors: *Trap efficiency, Sedimentation, *Sedimentation rates, *Reservoir design, *Reservoir silting, *Regression analysis, *Spillways, Stratification, Water quality, Surface runoff, Storage, Storage capacity, Erosion, Sediment yield, Particle size, Dead storage, *Missouri.
Identifiers: Non-linear regression, Detention time, Bottom-withdrawal spillway, Siphon spillway, Sediment reduction.

Research on three reservoirs in central Missouri has shown that reservoir sedimentation trap efficiency is affected by the detention time of storm runoff and by factors governing sediment particle size. Decreasing the detention time can be done by discharging storm runoff from the reservoir with the use of a bottom-withdrawal spillway. With the bottom-withdrawal spillway, the clean water remains in the reservoir and floats above the density currents caused by storm runoff moving to the deepest part of the reservoir. CALCULATING TEMPERATURE REGIME OF EARTH DAMS IN PERMAFROST REGIONS,
Moskovskii Inzhenerno-Stroitelnyi Institut (USSR). Dept. of Hydraulic Engineering Structures.
I.S. Moiseyev.
Available from the National Technical Information Service, Springfield, Va 22161, as ADA-010 826, $8.00 in paper copy, $2.25 in microfiche. CRREL Draft Translation 450, November 1974. 16 p, 7 fig, 5 ref. Translated from Gidrotekhnicheskiye Sooruzheniya (Hydraulic Engineering Structures), No. 29, p 281-293, 1959.

Descriptors: *Dams, *Earth dams, *Permafrost, *Arctic, Temperature, Measurement, Reservoirs, Thawing, Freezing, Frozen soils, Frozen ground, Cold regions, Structures.

One of the many features of earthfill dams in the regions of persistently frozen soils is the thermal regime in the body and base of the dam. After filling of the reservoir, part of the frozen earth dam will thaw slowly under the effect of water's heat, but after the passage of a certain time (depending on air temperature, temperature of water in the reservoir, material in dam body, and thickness of the permafrost layer) the thawing of the permafrost in the dam practically ceases. A steady state of temperature field sets in, in which the upper part of the dam will be thawed while the central and lower sections will be frozen. In the planning of these dams, it is necessary to establish the advancement of the interface between the thawed and the frozen zone in the period after the filling of the reservoir and the position of this boundary during a stationary state. The temperature fields within earth dams of various profiles at constant water temperatures in the reservoir and outside air can be calculated using equations presented. (Sims - ISWS)
W76-06191

IDENTIFICATION AND TREATMENT OF DISPERSIVE CLAY SOILS,
Oklahoma State Univ., Stillwater. School of Civil Engineering.
T. A. Haliburton, T. M. Petry, and M. L. Hayden.
July 1975. 14-06-D-7535.

Descriptors: *Clay soils, *Soil erosion, *Laboratory tests, Stabilization, Embankments, Earth dams, Cut slopes, *Erosion control, *Dispersion.
Identifiers: Chemical treatment(Soils).

A method was developed for physical testing for identification of potentially dispersive clay soil. In addition, the test was used to evaluate the effects of chemical treatment in reducing dispersive clay erosion potential. Previous research in soil science and soil engineering covering dispersive clay behavior was reviewed and previous methods for identification of dispersive clay behavior were discussed and evaluated. Based on the shortcomings of previous research, criteria for a physical identification test were developed, and the Physical Erosion Test, developed from these general criteria, was evaluated using 19 different soils from locations where dispersive erosion damage had occurred, plus three non-dispersive control soils. The Physical Erosion Test is believed to be a superior method, compared to other existing procedures, of identifying before the fact dispersive erosion problems, especially for artificially compacted earth structures. Hydrated lime, aluminum sulfate and sodium chloride were effective as chemical stabilizers to reduce dispersive clay erosion potential. (Bureau of Reclamation)

EVALUATION OF MILL TAILINGS DISPOSAL PRACTICES AND POTENTIAL DAM STABILITY PROBLEMS IN SOUTHWESTERN UNITED STATES. INVESTIGATION REPORT, KENNECOTT COPPER CORPORATION, CHINO LEACHING DUMP, SANTA RITA, NEW MEXICO, VOLUME 4,
Wahler (W. A.) and Associates, Palo Alto, Calif.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 077, $6.00 in paper copy, $2.25 in microfiche. Bureau of Mines OFR 50(4)-75, December 1974. 111 p, 14 fig, 1 tab, 15 ref, 2 append. Bu Mines S0110520.

Descriptors: *Waste dumps, *Sampling, *New Mexico, *Waste disposal, *Mining, Geology, Disposal, Leaching, Dams, Drilling, Testing, Piezometers, Rocks, Faults(Geologic), Earthquakes, Seismic studies.
Identifiers: *Mill tailings, *Disposal practices, *Santa Rita(NM), Dam stability, Open pit mine.

This report presented the results of a study of Kennecott Copper Corporation's Chino dump at Santa Rita, New Mexico, carried out as part of a research program conducted for the United States Department of the Interior, Bureau of Mines. The results of this study were to be used as background information -along with the results of studies on other selected sites and independent, but related, research -to advance the state-of-the-art of mine waste disposal technology and to begin the development of techniques, procedures, and criteria for the investigation, inspection, and review of existing and proposed mine waste embankments. The stability studies described were performed on only one cross section of the leach dump, utilizing data obtained from drilling, sampling, and testing which was limited in nature. Therefore it was not possible to evaluate the degree of safety or adequacy of the leach dump, and the information and data contained in the body of the report must be judged in that light. THE BEARING CAPACITY OF FLOATING ICE PLATES SUBJECTED TO STATIC OR QUASI-STATIC LOADS, A CRITICAL SURVEY,
Princeton Univ., N. J. Dept. of Civil and Geological Engineering.
A. D. Kerr.
Available from the National Technical Information Service, Springfield, Va 22161, as ADA-009 363, $4.00 in paper copy, $2.25 in microfiche. CRREL Research Report 333, March 1975. 43 p, 28 fig, 157 ref. ARPA DACA-70-C-0022.

Descriptors: *Ice, *Bearing strength, *Strength of materials, Mechanical properties, Stress, Pressure, Strength, Loads(Forces), Ice loads, Sea ice, Iced lakes, Rivers, Ice cover, Cold regions.
Identifiers: *Floating ice plates.

Field observations revealed that when a vehicle is small and relatively heavy it may break through the ice plate immediately after placement. In such cases, the plate response may be considered elastic up until failure. For relatively light vehicles, the ice plate deforms elastically at the instant of loading, but sustains the load. However, as time progresses, the ice plate continues to deform in creep, especially in the vicinity of the vehicle, and after a certain time interval the vehicle may break through the ice. The purpose of this report was to present a critical survey of the literature on the bearing capacity of floating ice plates. First, the various analytical attempts to determine the bearing capacity were reviewed. This was followed by a discussion of test data and their relation to the analytical results. The report concluded with a systematic summary of results, a discussion of observed shortcomings, and recommendations for needed investigations. (Sims-ISWS)

WATER-DISTRIBUTION-SYSTEM CORROSION CONTROL,
Indianapolis Water Co., Ind.
R. E. Trivers, J. F. Armacost, and J. A. Lee.
Journal of American Water Works Association, Vol. 66, No. 8, p. 453-455, August, 1974. 3 fig, 2 ref.

Descriptors: *Water distribution(Applied), *Corrosion control, *Films, *Distribution systems, Maintenance, *Indiana.

A corrosion control program has been undertaken by the Indianapolis (Ind.) Water Co., a water system consisting of 1820 miles of gray cast and ductile iron and 13 miles of reinforced concrete water mains. Two recent corrosion-related leaks have prompted action. The first step was to gain knowledge from corrosion specialists, through the Indiana Corrosion Society and Purdue University. To control such problems the limits of corrosion have to be found, soil tests are necessary before new construction, preventive measures must be incorporated into designs, and records of corrosion must be kept. Field testing equipment consists of a two man auger, vibroground in combination with a single probe, a high resistance voltmeter, and an AC ammeter. Lab equipment includes a pH meter, vibroground, and sodium azide-iodine solution to determine the existence of anaerobic sulphate-reducing bacteria. Field testing requires augering to 4.5 feet and collecting a sample to be analyzed in the lab. If corrosive conditions exist pipes are wrapped in 8-mil polythylene film which is economical to use. In some cases stray current from other utilities causes corrosion which then must be corrected. To determine the extent of corrosion on mains, test holes are dug and hydrostatic pressure tests are made. To date the recognition of corrosion has increased 6 to 16%, and 8 to 10% of new mains have been protected. (Smith - North Carolina)

METHOD FOR COLLECTING SCALE FORMATIONS IN WATER PIPES,
Key II Industries, Camarillo, Calif. (Assignee).
P. Centineo.
U.S. Patent No. 3,936,376, 3 p, 2 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 943, No 1, p 337, February 3, 1976.

Descriptors: *Patents, *Scaling, *Mineral water, *Water utilization, *Water conservation, *Water yield improvement, Corrosion, Damages, Descaling, Pipes, Electrodes, Screens, Separation techniques, Electric fields.
Identifiers: Water pipes.

Conglomerations of charged ions of minerals in a water pipe system resulting from subjecting the water to an alternating electric field are effectively removed from the water flow path by providing two screens. The first screen is located normal to the flow path so that the water flows through the screen. The second screen is located in a chamber connected laterally to a water pipe section carrying the water flow upstream of the first screen. The first and second screens are charged positively and negatively respectively so that the first screen will repel conglomerations of minerals and the second screen will attract the minerals to collect them in the chamber. Available from the National Technical Information Service, Springfield, Va., 22161, as PB-251 688, $6.00 in paper copy, $2.25 in microfiche. December 1974. 197 p. OWRT-A-031-MINN(1).

Descriptors: *Minnesota, *Information exchange, *Information retrieval, Documentation, Publications, Projects, *Data collections.
Identifiers: *Information systems, Information dissemination.

This catalog is a compilation of inventories of water and related land resources information systems used by State agencies, selected colleges, and the University of Minnesota. This catalog is divided into four sections. The first offers an introduction, study outline and rationale for the catalog. The second describes the many information systems inventoried. Due to the complexity of each system it was impossible to order them according to information system function. This section is therefore classified by organization rather than information type. A third section of this catalog is a cross tabulation of information types and organizations. This shows which organizations manage which information types. Within each matrix of the cross tab an Organizational Data Function Code, Data Time/Space Coverage Code and Information System Capability Code are presented. Thus, organization, information types, methodology of collection, use, and analysis are presented in this cross-tabulation. The final section of the catalog is a detailed index of information types which indicates the pages from the catalog on which this information is discussed.

Examination of Sewage and Sewage Sludge for Enteroviruses, Volume 1.
W76-06371 5A

AGRICULTURAL RUNOFF
A Model to Predict the Performance of Feedlot Runoff Control Facilities at Specific Oregon Locations,
W76-06382 5B

Water Quality Model for Small Agricultural Watershed,
W76-06641 5B

AGRICULTURAL WATERSHEDS
The Watershed Approach to Understanding our Environment,
W76-06311 5G

Water Quality Model for Small Agricultural Watershed,
W76-06641 5B

AGRICULTURE
Drought and Agriculture,
W76-06265 2B

Land Disposal of Sewage Sludge, Volume I (November 1972 - March 1973).
W76-06365 5E

AIR POLLUTION
The Role and Function of Verdure in Protecting the Human Environment.
W76-06240 4C

AIR POLLUTION EFFECTS
Health Significance of Airborne Microorganisms from Waste Water Treatment Processes, Part II: Health Significance and Alternatives for Action,
W76-06327 5C

AIRBORNE GAMMA MEASUREMENTS
Development of Snow Water Equivalent Survey Methods Using Airborne Gamma Measurements,
W76-06659 2C

AL-DALMAG PROVINCE (IRAQ)
Effect of Salinization on Certain Soil Microflora,
W76-06582 5C

ALABAMA
Harris V. BD. of Water and Sewer Comm'n (Recovery for Fire Damage to Restaurant from Lack of Water in Fire Hydrant).
W76-06545 6E

ALASKA
Prevention and Control of Culvert Icing, Summary Report on Studies FY 1966-70,
W76-06193 8A

Subarctic Plant Communities and Associated Litter and Soil Profiles in the Caribou Creek Research Watershed, Interior Alaska,
W76-06194 4D

Flood of June 1971 Fort Nelson and Muskwa Rivers,
W76-06367 2E

Preliminary Hydrography and Historic Terminal Changes of Columbia Glacier, Alaska,
W76-06449 7C

Fishery for King Crab in Alaska.
W76-06515 6E

Stock V. State (Constitutionality of State Environmental Conservation Act).
W76-06525 6E

Wernberg V State (Payment of Just Compensation for Taking of Littoral Property Rights).
W76-06531 6E

ALASKA STATE ENVIRONMENTAL CONSERVATION ACT
Stock V. State (Constitutionality of State Environmental Conservation Act).
W76-06525 6E

ALBERTA
Water Quality Data Alberta 1961 - 1973.
W76-06374 7C

ALFALFA
Effects of Fertilization and Irrigation on Yield and Potassium Content of Alfalfa and on Available Soil Potassium,
W76-06243 3F

Seed Germination, Respiration and Mitochondrial Efficiency of Three Alfalfa (Medicago Sativa L.) Cultivars Subjected to NACL Salinity,
W76-06264 3C

Salinity-Ozone Interactive Effects on Alfalfa Yield and Water Relations,
W76-06269 3C

ALGAE
Algae from Montane Streams on the Island of Mahe, in the Seychelles,
W76-06205 5C

Algae in the Gebel Marra Mts in West Sudan,
W76-06206 5C

Nutrient Transformations in Mass Cultures of Marine Algae,
W76-06441 5C

Biostimulation and Nutrient Assessment.
W76-06696 5C

Application of the Algal Assay Procedure in Biostimulation and Toxicity Testing,
W76-06697 5C

Field Evaluation of the Algal Assay Procedure on Surface Waters of North Carolina,
W76-06698 5C

Application of Algal Assays to Define the Effects of Wastewater Effluents upon Algal Growth in Multiple use River Systems,
W76-06699 5C

The Relationship of Laboratory Algal Assays to Measurements of Indigenous Phytoplankton in Long Lake, Washington,
W76-06700 5C

Comparison of the Algal Growth Responses of Selenastrum Capricornutum Printz and Anabaena Flos-Aquae (Lyngb.) De Brebisson in Waters Collected from Shagawa Lake, Minnesota,
W76-06701 5C

Algal Nutritional Bioassays of Lake Wylie, North Carolina.
W76-06703 5C

The Effects of Media Modifications upon Selenastrum Capricornutum in Batch Cultures,
W76-06706 5C

Water Plants of the World. A Manual for the Identification of the Genera of Freshwater Macrophytes,
W76-06745 2I

Control of Species Composition in Enriched Mass Cultures of Natural Phytoplankton Populations,
W76-06757 5C

ALGAL ASSAY PROCEDURE
Biostimulation and Nutrient Assessment.
W76-06696 5C

Application of the Algal Assay Procedure in Biostimulation and Toxicity Testing,
W76-06697 5C

Field Evaluation of the Algal Assay Procedure on Surface Waters of North Carolina,
W76-06698 5C

Application of Algal Assays to Define the Effects of Wastewater Effluents upon Algal Growth in Multiple use River Systems,
W76-06699 5C

The Relationship of Laboratory Algal Assays to Measurements of Indigenous Phytoplankton in Long Lake, Washington,
W76-06700 5C

Comparison of the Algal Growth Responses of Selenastrum Capricornutum Printz and Anabaena Flos-Aquae (Lyngb.) De Brebisson in Waters Collected from Shagawa Lake, Minnesota,
W76-06701 5C

Seasonal Variation of Algal Biomass Production Potential and Nutrient Limitation in Yaquina Bay, Oregon,
W76-06702 5C

Effects of Water Hardness, Phosphorus Concentration and Sample Pretreatment on the Algal Assay Procedure--Bottle Test,
W76-06708 5C

ALGAL GROTH POTENTIAL
The Effects of Media Modifications upon Selenastrum Capricornutum in Batch Cultures,
W76-06706 5C

ALGAL GROWTH POTENTIAL
Biostimulation and Nutrient Assessment.
W76-06696 5C

Application of the Algal Assay Procedure in Biostimulation and Toxicity Testing,
W76-06697 5C

Field Evaluation of the Algal Assay Procedure on Surface Waters of North Carolina,
W76-06698 5C

Application of Algal Assays to Define the Effects of Wastewater Effluents upon Algal Growth in Multiple use River Systems,
W76-06699 5C

The Relationship of Laboratory Algal Assays to Measurements of Indigenous Phytoplankton in Long Lake, Washington,
W76-06700 5C

Comparison of the Algal Growth Responses of Selenastrum Capricornutum Printz and Anabaena Flos-Aquae (Lyngb.) De Brebisson in Waters Collected from Shagawa Lake, Minnesota,
W76-06701 5C

Seasonal Variation of Algal Biomass Production Potential and Nutrient Limitation in Yaquina Bay, Oregon,
W76-06702 5C

Algal Nutritional Bioassays of Lake Wylie, North Carolina.
W76-06703 5C

A Bioassay Dilution Technique to Assess the Significance of Dredged Material Disposal,
W76-06709 5C

ALGAL NUTRIENTS
Nutrient Transformations in Mass Cultures of Marine Algae,
W76-06441 5C

ALKALI METALS
Evaporation Apparatus of Special Material,
W76-06482 5D

ALTERNATIVE COSTS
The Economics of Converting Natural Gas-Powered Irrigation Pumps to Alternate Energy Sources in Southeastern Arizona,
W76-06588 3F

ALTERNATIVE PLANNING
Economic and Legal Analysis of Alternative Flood Control Strategies: Phase I,
W76-06159 6F

Viability of Existing Water Resource Models, The Potomac River Basin Water Supply Alternatives,
W76-06424 6A

Evaluation of Pollution Abatement Techniques Applicable to Lost Creek and Brown's Creek Watershed, West Virginia.
W76-06570 5G

Kaneoche Alternatives: An Application of Impact Methodology.
W76-06574 6G

ALTUN-KUPRI (IRAQ)
Groundwater Resources of Altun-Kupri Area,
W76-06576 4B

ALUMINUM
Economic Analysis of Effluent Guidelines. The Nonferrous Metals Industry (Aluminum),
W76-06627 5G

ALUMINUM ALLOYS
Parametric Data for Long Term Operation of a Vertical, Plane Surface, Falling Film, Vapor Compression Evaporator,
W76-06249 3A

ALUMINUM INDUSTRY
Economic Analysis of Effluent Guidelines. The Nonferrous Metals Industry (Aluminum),
W76-06627 5G

AMMONIA
Effects of Salinity on Nitrification in the East River,
W76-06335 5C

Semi-Automated Ammonia Probe Determination of Kjeldahl Nitrogen in Freshwaters,
W76-06391 5A

A Photochemical Side Reaction That Interferes with the Phenolhypochlorite Assay for Ammonia,
W76-06712 5A

AMMONIA NITROGEN REMOVAL
Process of Removing Ammoniacal Nitrogen from Waste Water,
W76-06463 5D

AMMONIA PROBE
Semi-Automated Ammonia Probe Determination of Kjeldahl Nitrogen in Freshwaters,
W76-06391 5A

AMMONIFICATION
The Bacterial Composition, and the Metabolic Activity of Some Physiological Groups of Bacteria in Two Gravel Pit Lakes,
W76-06749 5C

AMMONIUM COMPOUNDS
Sewage Sludge and Ammonium Concentrations in the New York Bight Apex,
W76-06667 5B

AMMONIUM CONCENTRATIONS
Sewage Sludge and Ammonium Concentrations in the New York Bight Apex,
W76-06667 5B

AMMONIUM SULFATE
Process for the Treatment of Waste Waters Containing Sulfuric Acid and/or Ammonium Sulfate,
W76-06470 5D

ANABAENA
Comparison of the Algal Growth Responses of Selenastrum Capricornutum Printz and Anabaena Flos-Aquae (Lyngb.) De Brebisson in Waters Collected from Shagawa Lake, Minnesota,
W76-06701 5C

ANAEROBIC DIGESTION
Anaerobic Digestion of Sludge, Part II,
W76-06344 5D

ANALOG MODELS
Modeling Techniques for Groundwater Evaluation,
W76-06413 2F

ANALYSIS
Production Conditions in Trout Brooks of Beskid Mountains: Results of Research Carried out Within the Framework of the I.B.P. in the Years 1966 to 1971,
W76-06241 2E

ANALYTICAL TECHNIQUES
Acetylene Reduction Assays for Nitrogen Fixation in Freshwaters: A Note of Caution,
W76-06202 5A

National Eutrophication Survey Methods for Lakes Sampled in 1972.
W76-06221 5C

The Use of Chitosan Columns for the Removal of Mercury from Waters,
W76-06239 5A

Drought and Agriculture,
W76-06265 2B

A Technique for Estimating Active Nitrifying Mass and its Application in Designing Nitrifying Systems,
W76-06296 5A

Nitrosophenol and Nitrosonaphthol Derivatives as Reagents for Spectrophotometric Determination of Iron and Determination of Micro-Amounts in Waters with 2-Nitroso-5-Dimethylaminophenol,
W76-06303 5A

Chemical Analysis and Environmental Quality,
W76-06308 5A

A Few Considerations on the Measurement of Pore Size Distribution of Activated Carbon (Kasseitan no saikokei bunpu solutei ni kansuru 2,3 no kosatsu),
W76-06309 5D

Measurement in Water Research: Part 1.
W76-06310 5A

Chromatographic Determination of DMA and DMF in Aqueous Medium,
W76-06390 5A

Semi-Automated Ammonia Probe Determination of Kjeldahl Nitrogen in Freshwaters,
W76-06391 5A

Environmental Applications of Advanced Instrumental Analysis: Assistance Projects, FY 74,
W76-06647 5A

Analytical Quality Assurance for Trace Organics Analysis by Gas Chromatography/Mass Spectrometry,
W76-06648 5A

Biostimulation and Nutrient Assessment.
W76-06696 5C

Application of the Algal Assay Procedure in Biostimulation and Toxicity Testing,
W76-06697 5C

Field Evaluation of the Algal Assay Procedure on Surface Waters of North Carolina,
W76-06698 5C

Application of Algal Assays to Define the Effects of Wastewater Effluents upon Algal Growth in Multiple use River Systems,
W76-06699 5C

The Relationship of Laboratory Algal Assays to Measurements of Indigenous Phytoplankton in Long Lake, Washington,
W76-06700 5C

A Bioassay Dilution Technique to Assess the Significance of Dredged Material Disposal,
W76-06709 5C

A Photochemical Side Reaction That Interferes with the Phenolhypochlorite Assay for Ammonia,
W76-06712 5A

The Acid-Bubbling Method for Primary Productivity Measurements Modified and Tested,
W76-06716 5A

Activity Coefficients of Bicarbonates and Carbonates in Seawater,
W76-06720 5C

Apparatus for the in Situ Concentration of Trace Metals from Seawater,
W76-06721 5A

ANEMOMETERS
A Comparison of the Responses of Identical Cup Anemometers Mounted on a Spar and a Toroid Buoy,
W76-06392 7B

ANTARCTIC
Sediments Exposed on the Surface of the Ross Ice Shelf, Antarctica,
W76-06188 2C

Temperature and Salinity Structure in the Weddell Sea,
W76-06394 2L

ANTARCTIC OCEAN
Temperature and Salinity Structure in the Weddell Sea,
W76-06394 2L

ANTIDEGRADATION
Wisconsin Water Quality Standards.
W76-06501 5G

Utah Water Quality Standards,
W76-06503 5G

ANTITRANSPIRANTS
Effects of Antitranspirants on Distribution and Utilization of Photosynthate in Pinus Resinosa Seedlings,
W76-06792 2I

ANTRHOPOGENIC DISTURBANCE
Water Pollution and Anthropogenic Eutrophication of Inland Water Bodies, (In Russian),
W76-06775 5C

APPLES
Evaporative Cooling of 'Delicious' Apples: The Economic Feasibility of Reducing Environmental Heat Stress,
W76-06791 3F

AQUACULTURE
Polyspecies Aquaculture Systems: The Detrital Trophic Level,
W76-06759 5C

AQUATIC ANIMALS
The Water Fauna of the High Mountain Glacier Lakes in the Mandaras Valley in the High Hindu Kush, (In Polish),
W76-06166 5C

AQUATIC INSECTS
Aquatic Insects of Wisconsin,
W76-06215 5C

The Distributional Ecology and Diversity of Benthic Insects in Cement Creek, Colorado,
W76-06587 2I

AQUATIC PLANTS
State-Of-The-Art Survey and Evaluation of Marsh Plant Establishment Techniques: Induced and Natural; Volume I: Report of Research,
W76-06635 4A

State-of-the-Art Survey and Evaluation of Marsh Plant Establishment Techniques: Induced and Natural; Volume II: A Selected Annotated Bibliography on Aquatic and Marsh Plants and their Management,
W76-06636 4A

Water Plants of the World. A Manual for the Identification of the Genera of Freshwater Macrophytes,
W76-06745 2I

AQUATIC WEED CONTROL
Investigations of Aquatic Weed Control Methods and Their Environmental Effects on Nontarget Aquatic Species,
W76-06218 4A

Lake Management Conference, May 12-14, 1975.
W76-06642 4A

The Impact of Overwinter Drawdown on the Aquatic Vegetation of the Chippewa Flowage, Wisconsin,
W76-06711 4A

Identification and Management of Eurasian Water Milfoil in Wisconsin,
W76-06725 5C

AQUEOUS SOLUTION
Thermodynamic Properties of Bulk and Occluded Super-Cooled Water and Ionic Solutions,
W76-06155 1A

AQUEOUS SOLUTIONS
Aqueous Solubility of Petroleum as Applied to its Origin and Primary Migration,
W76-06455 4B

AQUIFER CHARACTERISTICS
A Combined Model of Water Table and River Stage Evolution,
W76-06380 2A

The Lower Wilcox Aquifer in Mississippi,
W76-06444 7C

The Miocene Aquifer System in Mississippi,
W76-06445 7C

Southeastern Michigan Water-Resources Study: Ground Water and Geology,
W76-06457 4B

Groundwater Resources of Altun-Kupri Area,
W76-06576 4B

AQUIFER SYSTEMS
A Combined Model of Water Table and River Stage Evolution,
W76-06380 2A

AQUIFER TESTING
Pumping Test Analysis When Parameters Vary with Depth,
W76-06687 4B

AQUIFERS
Planning a Must for Groundwater Development,
W76-06273 4B

Hydrothermal Convection in Saturated Porous Media,
W76-06415 2F

ARCTIC
Calculating Temperature Regime of Earth Dams in Permafrost Regions,
W76-06191 8D

Research Projects in Glaciology - 1974,
W76-06368 2C

ARGENTINA
Natural Isotopes in Surface and Groundwater from Argentina,
W76-06185 2F

ARID LANDS
Remote Sensing of Resources in Arid Lands,
W76-06260 7A

Drought and Agriculture,
W76-06265 2B

Soil Moisture Regime of Unsaturated Zone in Some Arid Regions,
W76-06578 2G

Hidden Waters in Arid Lands.
W76-06585 4B

Desertification: A World Problem,
W76-06592 4C

ARIZONA
More Water for Arizona.
W76-06261 3B

Orbital and High Altitude Imagery as a Management Tool for Land use and Flood Hazard Studies,
W76-06262 4A

Atlas of Arizona.
W76-06263 7C

Campbell Estates, Inc. V. Bates (Punitive Damages for Ditch Dumping All Drainage on Adjoining Property).
W76-06526 6E

Ramada Inns, Inc. V. Salt River Valley Water Users' Ass'n (No Strict Liability for Canal's Flooding of Hotel).
W76-06530 6E

Costs are Soaring: Irrigating from the Underground,
W76-06586 3F

The Economics of Converting Natural Gas-Powered Irrigation Pumps to Alternate Energy Sources in Southeastern Arizona,
W76-06588 3F

BIOLOGICAL TREATMENT
Novel Aeration System Bows,
W76-06289 5D

Thermophilic Microbiological Treatment of High Strength Wastewaters with Simultaneous Recovery of Single Cell Protein,
W76-06293 5D

Anaerobic Digestion of Sludge, Part II,
W76-06344 5D

Activated Bio-Filter Process,
W76-06349 5D

BIOMASS
Phytoplankton Biomass and Distribution in a Shallow Eutrophic Lake (Lake George, Uganda),
W76-06246 5C

BLACK HILLS
Recovery from Soil Compaction on Bluegrass Range in the Black Hills,
W76-06362 4D

BLACK HILLS (S DAK)
The Black Hills (South Dakota) Flood of June 1972: Impacts and Implications,
W76-06360 2E

BLACK HILLS (SD)
Recovery from Soil Compaction on Bluegrass Lange in the Black Hills,
W76-06405 2G

BLACK RIVER BAROMETER WATERSHED (ARIZ)
Black River Barometer Watershed in Relation to the Resource Manager,
W76-06599 4D

BLACK SEA
Suspended Matter and its Components in the Black Sea, (In Russian),
W76-06778 5B

BLUEGRASS BOTTOMS
Recovery from Soil Compaction on Bluegrass Range in the Black Hills,
W76-06362 4D

BLUEGRASS RANGE
Recovery from Soil Compaction on Bluegrass Lange in the Black Hills,
W76-06405 2G

BLUEGRASSES
Recovery from Soil Compaction on Bluegrass Lange in the Black Hills,
W76-06405 2G

BOATING
Wisconsin Recreational Harbor Facilities Along Lake Michigan,
W76-06628 6B

BOGS
Role of Bogs in the Formation of Spring Flood Runoff Losses in the Drainage Basins of the Northwestern European USSR,
W76-06175 4A

A Natural History Study of the Vascular Flora of Cedar Bog, Champaign Counts, Ohio,
W76-06760 2H

Vegetation Changes in a Small Michigan Bog from 1917 to 1972,
W76-06761 2H

BOTTOM SEDIMENTS
Erosion on the Line Islands Archipelagic Apron: Effect of Small-Scale Topographic Relief,
W76-06386 2L

BOUNDARIES (PROPERTY)
Myers V. Harris (Must be Clear and Convincing Evidence that Meander Line Meant to be Boundary).
W76-06527 6E

Dolphin Lane Ass., Ltd. V. Southampton (Location of Shoreline Property Boundary by Customary Method of Verbal Formulation).
W76-06534 6E

BOUNDARY DISPUTES
Dolphin Lane Ass., Ltd. V. Southampton (Location of Shoreline Property Boundary by Customary Method of Verbal Formulation).
W76-06534 6E

BOUNDARY PROCESSES
Skin Friction in Unsteady Laminar Pipe Flow,
W76-06389 8B

Desertification: A World Problem,
W76-06592 4C

BRACKISH WATER
Operating Data of a Vertical Plane Surface, Falling Film Evaporator Using Slurry and High Concentration Feeds,
W76-06250 3A

BRIDGE CONSTRUCTION
Arnett V Commonwealth Department of Highways (Liability for Damages to Crops Caused by Diversion of Water Resulting from Bridge Construction).
W76-06539 6E

BRINE DISPOSAL
Conversion of Desalination Plant Brines to Solids,
W76-06248 3A

BRUMUNDDAL SANDSTONE
Weathering and Hydrogeology of the Brumunddal Sandstone, Southern Norway,
W76-06676 2F

BUFFALO HARBOR (NY)
Buffalo Harbor Diked Disposal Sites: Engineering Properties and Drainage Characteristics,
W76-06666 5E

BUILDING CODES
Lauricella V. Planning and Zoning Board of Appeals (State Preemption of Authority over All Tidal Wetlands).
W76-06533 6E

BULK DENSITY
Bulk Density Sampler for Deep Soil Profiles,
W76-06171 7B

BULLHEADS
Ictalurus Nebulosus (Le Sueur, 1819) in a Lake Biocenosis, (In Polish),
W76-06765 2H

BURNING
Sludge Disposal Alternatives,
W76-06292 5E

CADMIUM
Cadmium and Zinc Contents of Corn Leaf and Grain Produced by Sludge-Amended Soil,
W76-06304 5A

CALIFORNIA
Water Relations of Selected Species of Chaparral and Coastal Sage Communities,
W76-06259 3B

Flood Plain Information: Uvas-Carnadero Creek, Pajaro River to Uvas Reservoir, Santa Clara County, California.
W76-06283 4A

Flood Plain Information: Van Duzen River, Humbolt County, California.
W76-06355 4A

Flood Plain Information: San Timoteo Creek, Vicinity of Loma Linda, San Bernardino County, California.
W76-06356 4A

Transient Water Quality Modeling in Streams,
W76-06433 5B

A Practical Monthly Optimum Operations Model,
W76-06436 4A

Water Quality Planning Strategy,
W76-06439 5G

Erosion and Sediment Transport in the Owens River Near Bishop, California,
W76-06458 2J

Los Angeles V. San Fernando (Pueblo Rights to Water).
W76-06536 6E

Sierra Club V. Morton (Prohibition of Dams and Dikes Across Navigable Waters Under River and Harbors Act of 1899).
W76-06540 6E

CALIFORNIA WATER PROJECT
Sierra Club V. Morton (Prohibition of Dams and Dikes Across Navigable Waters Under River and Harbors Act of 1899).
W76-06540 6E

CALLAO (PERU)
A Cost Analysis System for Ports,
W76-06631 6A

CANADA
The Biogeochemistry of Phosphorus in an Experimental Lake Environment: Evidence for the Formation of Humic-Metal-Phosphate Complexes,
W76-06203 5C

The Phytoplankton and Primary Productivity of Southern Indian Lake (Manitoba), A High Latitude, Riverine Lake,
W76-06204 5C

The Importance of Diurnal Variation of Photosynthesis vs. Light Curves to Estimates of Integral Primary Production,
W76-06210 5C

An Approach to a Water Quality Index for Canada,
W76-06272 5G

Canada Water Act - Annual Report, 1973-74,
W76-06369 6E

Water Quality Data Alberta 1961 - 1973.
W76-06374 7C

Sediment Data, Canadian Rivers 1972.
W76-06376 7C

Surface Water Data, Reference Index, Canada 1975.
W76-06377 7C

Lake Location and Quality as Determinants of Potential Recreation Benefits: A Study of Selected Lakes in Manitoba,
W76-06622 6B

Penetration of the Deep Layer of the Saguenay Fjord by Surface Waters of the St. Lawrence Estuary,
W76-06674 2L

Upwelling Along the Yarmouth Shore of Nova Scotia,
W76-06688 2L

Precipitation in Valleys,
W76-06693 2B

Degree of Pollution of the Saint Lawrence River from Repentigny to Montmagny, (In French),
W76-06734 5B

Degree of Pollution of the Saint Lawrence River from Repentigny to Montmagny: II. Biochemical Pollution, (In French),
W76-06735 5B

CANADA WATER ACT
Canada Water Act - Annual Report, 1973-74,
W76-06369 6E

CANAL SEEPAGE
Taylor Ditch Co. V Carey (Damage to Nearby Property from Irrigation Ditch Seepage).
W76-06528 6E

CANAL ZONE
Vibrio Parahaemolyticus in Seawater Off the Pacific Coast of Panama,
W76-06252 2L

CANALS
Energy and Pollution Concerns in Dredging,
W76-06183 5C

Ramada Inns, Inc. V. Salt River Valley Water Users' Ass'n (No Strict Liability for Canal's Flooding of Hotel).
W76-06530 6E

CAPITAL COSTS
Vertical Tube Distillation Desalting, State-of-the-Art (1971), Nomograph Booklet.
W76-06254 3A

An Economic Study of the Unox and Conventional Aeration Systems,
W76-06288 5D

CARBOHYDRATES
The Determination of Carbohydrates in Natural Waters: A Comparison of Paper Chromatographic: Colorimetric and Enzymatic Methods, (In German),
W76-06773 5A

CARBON
Nitrogen, Phosphorus and Carbon Flux in Chesapeake Bay Marshes,
W76-06162 5C

Accumulation Rate and Turnover Time of Organic Carbon in a Salt Marsh Sediment,
W76-06714 5C

CARBON ACCUMULATION
Accumulation Rate and Turnover Time of Organic Carbon in a Salt Marsh Sediment,
W76-06714 5C

CARBON DIOXIDE PRODUCTION
Relationship Between Plant Respiration and Water Metabolism, (In Russian),
W76-06789 2I

CARBONATE ROCKS
Solution Chemistry, Mass Transfer, and the Approach to Chemical Equilibrium in Porous Carbonate Rocks and Sediments,
W76-06384 2K

CARBONATES
Activity Coefficients of Bicarbonates and Carbonates in Seawater,
W76-06720 5C

CARIBOU CREEK WATERSHED (ALAS)
Subarctic Plant Communities and Associated Litter and Soil Profiles in the Caribou Creek Research Watershed, Interior Alaska,
W76-06194 4D

CARLSBAD CAVERNS (N MEX)
Factors Altering the Microclimate in Carlsbad Caverns, New Mexico,
W76-06452 2D

CARP
Genetic Differences in Susceptibility to Two Diseases Among Strains of the Common Carp,
W76-06764 5C

The Effect of Water Temperature of the Incubation Time of a Pituitary Injection in Carp (Cyprinus Carpio L.) Under Field Conditions, (In German),
W76-06787 5C

CARPATHIAN MOUNTAINS (POLAND)
Ecology and Biogeography of Mayflies (Ephemeroptera) of Running Waters in the Polish Part of the Carpathians. 1. Distribution and Quantitative Analysis,
W76-06216 5C

CARROTS
Seedbed Soil Salinity and Emergence of Peppers and Carrots Under Sprinkler and Furrow Irrigation,
W76-06305 3C

CARRYING CAPACITY
A Simulation Model for the Management of Low Density Recreational Areas,
W76-06233 6B

CASCADE MOUNTAINS (WASH)
Cascade Atmospheric Water Resources Program, Volume I,
W76-06600 3B

Cascade Atmospheric Water Resources Program, Volume 2,
W76-06601 3B

Cascade Atmospheric Water Resources Program, Volume 3,
W76-06602 2B

CAVES
Factors Altering the Microclimate in Carlsbad Caverns, New Mexico,
W76-06452 2D

CEMENT CREEK (COLO)
The Distributional Ecology and Diversity of Benthic Insects in Cement Creek, Colorado,
W76-06587 2I

CENTRAL CHERNOZEM REGIONS
Method for Computing Evaporation During the Snow Melting and Flood Period in the Central Chernozem Regions of the European USSR,
W76-06407 2D

CENTRAL U.S.
Urban Effects on the Distribution of Heavy Convective Rainfall,
W76-06680 4C

CENTRAL VALLEY PROJECT (CALIF)
A Practical Monthly Optimum Operations Model,
W76-06436 4A

CHANNEL EROSION
Initiation of Bed Forms and Meanders in Coarse-Grained Sediment,
W76-06385 2J

CHANNEL IMPROVEMENT
Southern Nat. Gas Co. V Gulf Oil Corp. (Liability for Damages to Underwater Pipeline by Dredge which was a 'Vessel in Navigation').
W76-06542 6E

CHANNEL MORPHOLOGY
Physical and Climatic Characteristics Along Kansas Streams,
W76-06450 7C

CHANNEL STABILIZATION
Optimum Dredged Depth in Inland Waterway,
W76-06182 2J

CHANNELS
Optimum Dredged Depth in Inland Waterway,
W76-06182 2J

Flood Plain Information: Salmon Brook, East Branch and West Branch, Granby and E. Granby, Connecticut.
W76-06358 4A

Fry V. Kaiser (Rights of Owners of Recorded Plats Abutting Channel as Compared to Those of Subdivision Developer).
W76-06546 6E

CHAPARRAL
Water Relations of Selected Species of Chaparral and Coastal Sage Communities,
W76-06259 3B

Managing Chaparral for Water and Other Resources in Arizona,
W76-06597 3B

CHARTER BOATS
An Economic Analysis of Georgia's Marine Charter Boat Fishing Industry,
W76-06624 6C

CHEAT LAKE (W VA)
A Comparative Study of Chemical Loadings of Acid and Non-Acid Tributaries of Cheat Lake, West Virginia,
W76-06213 5B

CHELATION
The Biogeochemistry of Phosphorus in an Experimental Lake Environment: Evidence for the Formation of Humic-Metal-Phosphate Complexes,
W76-06203 5C

CHEMICAL ANALYSIS
Hot Springs of Rhodesia: Their Noble Gases, Isotopic and Chemical Composition,
W76-06190 2K

A Comparative Study of Chemical Loadings of Acid and Non-Acid Tributaries of Cheat Lake, West Virginia,
W76-06213 5B

CHEMICAL OXYGEN DEMAND
Soap and Detergent Manufacturing Category (Pretreatment Standards for Incompatible Pollutants).
W76-06517 5G

Refinery Effluent Water Treatment Plant Using Activated Carbon,
W76-06646 5D

CHEMICAL PRECIPITATION
Process for Dewatering a Proteinaceous, Aqueous Sludge and for Removing and Recovering Precipitating Agents from a Precipitate Containing Proteinaceous Substances,
W76-06478 5D

CHEMICAL PROPERTIES
Loess in Ohio in Relation to Several Possible Source Areas: I. Physical and Chemical Properties,
W76-06399 2J

Thick BH Horizons in the North Carolina Coastal Plain: II: Physical and Chemical Properties and Rates of Organic Additions from Surface Sources,
W76-06403 2G

Penetration of the Deep Layer of the Saguenay Fjord by Surface Waters of the St. Lawrence Estuary,
W76-06674 2L

CHEMICAL REACTIONS
Chlorination in Dilute Aqueous Systems; 2,4,6-Trichlorophenol,
W76-06306 5B

A Photochemical Side Reaction That Interferes with the Phenolhypochlorite Assay for Ammonia,
W76-06712 5A

CHEMICAL WASTES
Regional Distribution of the Major Dissolved Solids in the Streams of Illinois,
W76-06163 5B

Zero Discharge to the Environment of Difficult Wastewaters,
W76-06341 5D

Process for the Treatment of Waste Waters Containing Sulfuric Acid and/or Ammonium Sulfate,
W76-06470 5D

CHEMICALLY-TREATED SLUDGE
Land Disposal of Sewage Sludge, Volume I (November 1972 - March 1973).
W76-06365 5E

CHEMICALS
Differences in Chemical Composition Between Two Species of Daphnia and Some Freshwater Algae Cultured in the Laboratory,
W76-06713 5C

CHEMISTRY OF PRECIPITATION
Sodium, Potassium, Calcium and Magnesium Content of Northwest Arkansas Rain Water in 1973,
W76-06379 2B

CHESAPEAKE BAY
Nitrogen, Phosphorus and Carbon Flux in Chesapeake Bay Marshes,
W76-06162 5C

Classification of Wetlands Vegetation Using Small Scale Color Infrared Imagery,
W76-06411 2L

Summary and Conclusions: Nutrient Transport and Accountability in the Lower Susquehanna River Basin,
W76-06575 5B

CHINLE FORMATION (ARIZ - N MEX)
Depositional Models and the Shinarump Member and the Sonsela Sandstone Bed of the Chinle Formation Northeastern Arizona and Northwestern New Mexico,
W76-06258 2J

CHLORIDES
Salinities of Ambient and Interstitial Waters of Some Massachusetts North Shore Salt-Marshes,
W76-06158 5B

CHLORINATION
Chlorination in Dilute Aqueous Systems; 2,4,6-Trichlorophenol,
W76-06306 5B

CHLOROCHOLINE CHLORIDE
Effect of Irrigation Regimes in Relation to Chlorcholine Chloride (CCC) Application on Wheat,
W76-06279 3F

CHLOROPHYLL
Chlorophyll a Content as an Index of Periphyton Productivity, Exemplified by Lake Krasnoe, (In Russian),
W76-06772 5A

CHLOROPHYLL DEFICIENCY
Flooding Effects on Light Reflectance, Transmittance, and Absorptance of Cotton (Gossypium Hirsutum) Leaves,
W76-06794 2I

CHLOROPHYTA
Algae in the Gebel Marra Mts in West Sudan,
W76-06206 5C

A Continuous Flow Apparatus for the Culture of Filamentous Green Algae,
W76-06244 5C

CHOLESTEROL
Relationship Between Various Bacterial Populations and Coprostanol and Cholesterol,
W76-06336 5C

CHROMATOGRAPHY
The Determination of Carbohydrates in Natural Waters: A Comparison of Paper Chromatographic: Colorimetric and Enzymatic Methods, (In German),
W76-06773 5A

CHURCHILL RIVER (MANITOBA)
The Phytoplankton and Primary Productivity of Southern Indian Lake (Manitoba), A High Latitude, Riverine Lake,
W76-06204 5C

CITIES
Reorientation of Urban Water Resources Research, Final Report,
W76-06553 6B

Reorientation of Urban Water Resources Research, Executive Summary,
W76-06554 6B

Inventory of Florida Coastal Zone Planning Publications: Volume I, Coastal Counties and Cities.
W76-06566 2L

CLADOPHORA
The Effect of Bacterial Substances on the Growth of Two Cladophoraciae in Pure Culture, (In German),
W76-06779 5C

CLASSIFICATION
Classification of Wetlands Vegetation Using Small Scale Color Infrared Imagery,
W76-06411 2L

Utah Water Quality Standards,
W76-06503 5G

Washington Water Quality Standards.
W76-06511 5G

Tire and Synthetic Segment of the Rubber Processing Point Source Category.
W76-06516 5G

Effluent Limitations and Guidelines - Printing Ink Formulating Point Source Category.
W76-06520 5G

Nonferrous Metals Manufacturing Point Source Category.
W76-06521 5G

CLAY FRACTIONS
Loess in Ohio in Relation to Several Possible Source Areas: II. Elemental and Mineralogical Composition,
W76-06400 2J

CLAY SOILS
Identification and Treatment of Dispersive Clay Soils,
W76-06611 8D

CLAYS
Stabilization of Clay Soils Against Erosion Loss,
W76-06640 4D

CLIMATES
Changes in Climate and Estimated Evaporation Across a Large Irrigated Area in Idaho,
W76-06406 2D

CLIMATIC CHANGE
Changes in Climate and Estimated Evaporation Across a Large Irrigated Area in Idaho,
W76-06406 2D

CLIMATIC DATA
Physical and Climatic Characteristics Along Kansas Streams,
W76-06450 7C

Satellite Support to the Hiplex Activities for 1975,
W76-06613 3B

CLIMATOLOGY
Operational Ice Forecast for the Little Rapids Cut,
W76-06658 2C

CLOSED CONDUITS
Menabrea's Note on Waterhammer: 1858,
W76-06388 8B

Skin Friction in Unsteady Laminar Pipe Flow,
W76-06389 8B

CLOSED LAKES
Level of Closed Bodies of Water as One of the Criteria of Global Water Exchange,
W76-06179 2A

CLOSTRIDIUM
Effect of Salinization on Certain Soil Microflora,
W76-06582 5C

CLOUD PHYSICS
The Interpretation of the Crystalline and Air Bubble Structures of Hail Stones,
W76-06167 2B

Production of Secondary Ice Particles During the Growth of Graupel by Riming,
W76-06168 2B

Ice Particle Multiplication in Cumulus Clouds,
W76-06678 2B

CLOUD SEEDING
Large Scale Effects of Cloud Seeding,
W76-06562 3B

Colorado River Basin Pilot Project, Final Comprehensive Operations Report,1970-1975 Season,
W76-06564 3B

Cascade Atmospheric Water Resources Program, Volume I,
W76-06600 3B

Cascade Atmospheric Water Resources Program, Volume 2,
W76-06601 3B

Cascade Atmospheric Water Resources Program, Volume 3,
W76-06602 2B

Effects of Cloud Seeding on Summertime Precipitation in North Dakota,
W76-06603 3B

Determination of R-Z Relationships for Weather Radar Using Computer Optimization Techniques,
W76-06604 2B

The Potential for Rainfall Increases from Convective Clouds in the Northern Plains,
W76-06607 3B

THE MEDICINE BOW ECOLOGY PROJECT: The Potential Sensitivity of Various Ecosystem Components to Winter Precipitation Management in the Medicine Bow Mountains, Wyoming,
W76-06610 5C

Cloud Seeding to Enhance Summer Rainfall in the Northern Plains,
W76-06612 3B

CLOUDS
Satellite Support to the Hiplex Activities for 1975,
W76-06613 3B

COAGULATION
Modernizing Water Filtration Plants,
W76-06275 5F

COAL GASIFICATION
Northern Great Plains Resource Program, Water Work Group Report.
W76-06616 3E

COAL MINE WASTES
Development of an Economic/Environmental Plan for Dents Run Watershed, West Virginia.
W76-06270 5G

Mine Spoil Reclamation Research at the Belle Ayr Mine, Northeast Wyoming,
W76-06361 5G

Evaluation of Pollution Abatement Techniques Applicable to Lost Creek and Brown's Creek Watershed, West Virginia.
W76-06570 5G

COASE THEOREM
Externalities and Coase Theorem: A Graphical Analysis,
W76-06621 6C

COASTAL ENGINEERING
Statistics of Random Wave Field,
W76-06397 8B

COASTAL ZONE MANAGEMENT
A Study to Assess Goals for Uses and Management of Shoreline and Implications for Corps of Engineers Programs.
W76-06418 6B

COASTS
On a Stochastic Model to Estimate Tsunami Risk,
W76-06189 2L

Secondary Succession Following Extended Inundation of Texas Coastal Rangeland,
W76-06267 4A

A Study to Assess Goals for Uses and Management of Shoreline and Implications for Corps of Engineers Programs.
W76-06418 6B

Inventory of Florida Coastal Zone Planning Publications: Volume I, Coastal Counties and Cities.
W76-06566 2L

Inventory of Florida Coastal Zone Planning Publications: Volume II, Multi-County Planning Districts.
W76-06567 2L

COASTS

Inventory of Florida Coastal Zone Planning Publications: Volume III, Statewide.
W76-06568 2L

Analysis and Interpretation of Littoral Environment Observation (Leo) and Profile Data Along the Western Panhandle Coast of Florida,
W76-06637 2L

Observations of Currents and Temperatures in the Southeast Florida Coastal Zone During 1971-72,
W76-06656 2L

Upwelling Along the Yarmouth Shore of Nova Scotia,
W76-06688 2L

The Dynamic Structure of the Frontal Zone in the Coastal Upwelling Region Off Oregon,
W76-06695 2L

COLIFORMS

Applications of Linear Time Series Models and Stepwise Regression Models to Selected Water Quality Data on the Connecticut River,
W76-06157 5B

Relationship Between Various Bacterial Populations and Coprostanol and Cholesterol,
W76-06336 5C

COLORADO

Flood Plain Information: Upper St. Vrain Creek, Volume IV, Boulder County, Colorado.
W76-06357 4A

Rainfall-Runoff Data from Small Watersheds in Colorado, October 1971 through September 1974,
W76-06446 7C

Hydrologic Data for the Idaho National Engineering Laboratory Site, Idaho, 1971 to 1973,

W76-06525 6E

Child V Spanish Fork (Transference of Irrigation Water as Precedent to Annexation).
W76-06535 6E

Westerrelt V. Natural Resources Commission (Rules to Regulate Watercraft and Liveries on the Ausable, Manistee, Pine and Pere Marquette Rivers Void as Overbroad).
W76-06543 6E

CONSTRUCTION
Government-Contractor-Engineer Liason that Creates an Economical Project,
W76-06319 5F

CONTINENTAL SHELF
Decisions for Delaware: Sea Grant Looks at Legal Aspects of OCS Development,
W76-06485 6E

CONTROL
Release Control Policy for a Large Lake Subject to Wind Waves,
W76-06421 4A

Control of a River System with Two Storage Reservoirs,
W76-06422 4A

Application of Multi-Regional Planning Models to the Scheduling of Large-Scale Water Resource Systems Development,
W76-06425 6A

Water Quality Planning Strategy,
W76-06439 5G

CONTROL SYSTEMS
Full Automation Goal of Water Reclamation Plant,
W76-06337 5D

CONVECTION
Temperature and Salinity Structure in the Weddell Sea,
W76-06394 2L

Urban Effects on the Distribution of Heavy Convective Rainfall,
W76-06680 4C

COOLING
Method for Determining and Controlling Liquid Cooling System Characteristics.
W76-06484 5G

COOLING SYSTEMS
Method for Determining and Controlling Liquid Cooling System Characteristics.
W76-06484 5G

COOLING WATER
Submerged Multiport Diffusers for Cooling Water Discharge,
W76-06464 5D

Method for Determining and Controlling Liquid Cooling System Characteristics.
W76-06484 5G

COOPERATIVES
A Guide to Wisconsin's Lake Management Law.
W76-06632 6E

COORDINATION
Water Quality Planning Strategy,
W76-06439 5G

Water Resources Development of International Rivers with Special Reference to the Developing World,
W76-06486 4A

Washington Environmental Coordination Procedures Act of 1973,
W76-06505 6E

COPPER
Nonferrous Metals Manufacturing Point Source Category.
W76-06521 5G

COPROSTANOL
Relationship Between Various Bacterial Populations and Coprostanol and Cholesterol,
W76-06336 5C

CORN (FIELD)
Effects of Water Stress on Leaf Respiration, Transpiration Rates in the Dark and Cuticular Resistance to Water Vapor Diffusion of Two Corn Inbreds,
W76-06266 2D

Water Use, Energy Balance and Growth of Maize at Samaru, Northern Nigeria,
W76-06298 3F

Localization of Damage Incurred During Water Imbibition by Pisum Sativum and Zea Mays Seeds, as Revealed by the Topographic Tetrazolium Test,
W76-06649 2I

CORRELATION ANALYSIS
Experiment in Applying Correlation Analysis to the Description of the Temporal Variations of Snow Melting Intensity in the Don River Basin,
W76-06173 2C

CORROSION CONTROL
Operating Data of a Vertical Plane Surface, Falling Film Evaporator Using Slurry and High Concentration Feeds,
W76-06250 3A

Water-Distribution-System Corrosion Control,
W76-06276 8G

COST ANALYSIS
A Cost Analysis System for Ports,
W76-06631 6A

COST-BENEFIT ANALYSIS
An Evaluation of Cost-Benefit Analysis Criteria,
W76-06227 6B

Federal Environmental Impact Statements--A Case Study,
W76-06557 6G

COST ESTIMATING PROCEDURES
A Standardized Procedure for Estimating Costs of Saline Water Conversion.
W76-06550 3A

COSTS
Costs in Relation to Charges at UK Common-User Berths,
W76-06234 6C

Development of an Economic/Environmental Plan for Dents Run Watershed, West Virginia.
W76-06270 5G

Sludge Disposal Alternatives,
W76-06292 5E

Pollution--Right of Shipowner to Contribution from United States Where Negligence of Coast Guard was a Cause of Casualty and Ensuing Spill. Burgess V. The Tamano, 373 F Supp 839 (D ME 1974),
W76-06493 5G

Minnesota Environmental Impact Statements--A Users Viewpoint,
W76-06559 6G

Correlation of Radioactive Waste Treatment Costs and the Environmental Impact of Waste Effluents in the Nuclear Fuel Cycle for Use in Establishing 'As Low as Practicable' Guides--Appendix A. Preparation of Cost Estimates for Volume 1, Milling of Uranium Ores,
W76-06614 5D

COTTON
Flooding Effects on Light Reflectance, Transmittance, and Absorptance of Cotton (Gossypium Hirsutum) Leaves,
W76-06794 2I

CRABS
Fishery for King Crab in Alaska.
W76-06515 6E

CRAYFISH
The Effects of a Benthic Grazer on the Primary Productivity of the Littoral Zone of Lake Tahoe,
W76-06719 5C

CROP PRODUCTION
Salinity-Ozone Interactive Effects on Alfalfa Yield and Water Relations,
W76-06269 3C

CROP RESPONSE
Varietal Response of Peas to Irrigation and Interrow Spacing,
W76-06799 3F

CROPS PRODUCTIVITY
Effect of Different Frequencies of Irrigation on Granulation in Sweet Orange (Citrus Sinensis Osbeck),
W76-06797 3F

CRUSTACEANS
The Planktonic Crustaceans of Moncove Lake, Monroe County, W. Va.,
W76-06214 5C

Production of Planktonic Crustaceans of Two Secondary Oligotrophic Lakes, (In Russian),
W76-06301 5C

CRYSTAL GROWTH
Rapid Production of Single Crystals of Ice,
W76-06186 2C

CRYSTALS
Rapid Production of Single Crystals of Ice,
W76-06186 2C

CULICIDAE
The 'Rheinschnaken' (Diptera, Culicidae) Species, Life Style, Ecology, Mass Development, and Control, (In German),
W76-06768 2I

CULTURE
Continuous Cultures Applied to Ecological Research, (In French),
W76-06782 5C

CULTURE MEDIA
The Effects of Media Modifications upon Selenastrum Capricornutum in Batch Cultures,
W76-06706 5C

CULTURES
A Continuous Flow Apparatus for the Culture of Filamentous Green Algae,
W76-06244 5C

Comparison of Semi-Continuous and Continuous Flow Bioassays,
W76-06705 5C

The Effects of Media Modifications upon Selenastrum Capricornutum in Batch Cultures,
W76-06706 5C

Effects of Water Hardness, Phosphorus Concentration and Sample Pretreatment on the Algal Assay Procedure--Bottle Test,
W76-06708 5C

CULVERTS
Prevention and Control of Culvert Icing, Summary Report on Studies FY 1966-70,
W76-06193 8A

CUMULUS CLOUDS
Cloud Seeding to Enhance Summer Rainfall in the Northern Plains,
W76-06612 3B

CURRENT MEASUREMENT
Observations of Currents and Temperatures in the Southeast Florida Coastal Zone During 1971-72,
W76-06656 2L

CUTICULAR RESISTANCE
Effects of Water Stress on Leaf Respiration, Transpiration Rates in the Dark and Cuticular Resistance to Water Vapor Diffusion of Two Corn Inbreds,
W76-06266 2D

CYANOPHYTA
Algae in the Gebel Marra Mts in West Sudan,
W76-06206 5C

Associations of Blue-Green Algae of Thermal Springs of Stravropol and Krasnodar Krais and Georgian SSR, (In Russian),
W76-06769 5C

CYCLING NUTRIENTS
Nitrogen, Phosphorus and Carbon Flux in Chesapeake Bay Marshes,
W76-06162 5C

The Biogeochemistry of Phosphorus in an Experimental Lake Environment: Evidence for the Formation of Humic-Metal-Phosphate Complexes,
W76-06203 5C

Accumulation Rate and Turnover Time of Organic Carbon in a Salt Marsh Sediment,
W76-06714 5C

CYCLONES
Cascade Atmospheric Water Resources Program, Volume I,
W76-06600 3B

DADE COUNTY (FLA)
Ground-Water Quality in Selected Areas Serviced by Septic Tanks, Dade County, Florida,
W76-06442 5B

DALMAJ PILOT PROJECT AREA (IRAQ)
Investigation of Some Physical Properties of the Soils in the Dalmaj Pilot Project Area,
W76-06579 2G

DAMAGES
Taylor Ditch Co. V Carey (Damage to Nearby Property from Irrigation Ditch Seepage).
W76-06528 6E

Arnett V Commonwealth Department of Highways (Liability for Damages to Crops Caused by Diversion of Water Resulting from Bridge Construction).
W76-06539 6E

Southern Nat. Gas Co. V Gulf Oil Corp. (Liability for Damages to Underwater Pipeline by Dredge which was a 'Vessel in Navigation').
W76-06542 6E

DAMS
Calculating Temperature Regime of Earth Dams in Permafrost Regions,
W76-06191 8D

Determination of Optimum Quantity of Service Water Obtainable from One Dam System,
W76-06419 4A

Inflatable Water-Retaining Barrier,
W76-06462 8A

Taylor V Carrico (No Liability for Spillover of Artificially Accumulated Water Which is Not a Nuisance).
W76-06538 6E

DAPHNIA
The Planktonic Crustaceans of Moncove Lake, Monroe County, W. Va.,
W76-06214 5C

DATA ANALYSIS (RAINFALL)
Optimal Sampling and Objective Analysis,
W76-06609 2B

DATA COLLECTIONS
Water Information Systems Catalog.
W76-06256 10C

Data Collection Systems and Their Impact on the Future Development of Hydrology,
W76-06277 7A

Earthwatch,
W76-06321 5A

Water Quality Data Alberta 1961 - 1973.
W76-06374 7C

Sediment Data, Canadian Rivers 1972.
W76-06376 7C

Surface Water Data, Reference Index, Canada 1975.
W76-06377 7C

Factors Altering the Microclimate in Carlsbad Caverns, New Mexico,
W76-06452 2D

Progress Report on the Water Resources Investigation of Martin County, Florida,
W76-06459 4B

Development of an Experimental Hydrometeorological Data Collection Network,
W76-06606 2B

Fortran Graphics Programs for Physical Oceanographic and Time Series Data,
W76-06661 7C

DATA PROCESSING
Full Automation Goal of Water Reclamation Plant,
W76-06337 5D

Optimal Sampling and Objective Analysis,
W76-06609 2B

Pumping Test Analysis When Parameters Vary with Depth,
W76-06687 4B

DATA STORAGE AND RETRIEVAL
Data Collection Systems and Their Impact on the Future Development of Hydrology,
W76-06277 7A

DECISION MAKING
Wisconsin Public Participation Procedures.
W76-06500 6E

Cognitive Strawman: Public Input to a Water Resource Planning System,
W76-06548 6B

Federal Environmental Impact Statements--A Case Study,
W76-06557 6G

Minnesota Environmental Impact Statement Requirements,
W76-06560 6G

Development of a Priority Determination Procedure.

DECOMPOSING ORGANIC MATTER
Thick BH Horizons in the North Carolina Coastal Plain: I. Morphology and Relation to Texture and Soil Ground Water,
W76-06402 2C

Thick BH Horizons in the North Carolina Coastal Plain: II: Physical and Chemical Properties and Rates of Organic Additions from Surface Sources,
W76-06403 2C

Oregon Synthetic Cleansing Agent Act,
W76-06502 6E

DEEP SOIL PROFILES
Bulk Density Sampler for Deep Soil Profiles,
W76-06171 7B

DEEP WATER PORTS
Decisions for Delaware: Sea Grant Looks at Legal Aspects of OCS Development,
W76-06485 6E

DEEPWATER PORT ACT
Decisions for Delaware: Sea Grant Looks at Legal Aspects of OCS Development,
W76-06485 6E

DELAWARE
Decisions for Delaware: Sea Grant Looks at Legal Aspects of OCS Development,
W76-06485 6E

DELAWARE BAY
Use of Silver and Zinc to Trace Sewage Sludge Dispersal in Coastal Waters,
W76-06655 5B

DELAWARE RIVER
Borough of Morrisville V. Delaware River Basin Commission (1958 Federal Water Supply Act, Surface Water Use).
W76-06537 6E

DELAWARE RIVER BASIN COMMISSION
Implementation of Interstate Water Quality Plan,
W76-06201 5G

DEMONSTRATION WATERSHEDS
Black River Barometer Watershed in Relation to the Resource Manager,
W76-06599 4D

DENITRIFICATION
The Bacterial Composition, and the Metabolic Activity of Some Physiological Groups of Bacteria in Two Gravel Pit Lakes,
W76-06749 5C

DENSITY
A Simulation Model for the Management of Low Density Recreational Areas,
W76-06233 6B

DENTS RUN WATERSHED (WV)
Development of an Economic/Environmental Plan for Dents Run Watershed, West Virginia.
W76-06270 5G

DEPENDABLE SUPPLY
Harris V. BD. of Water and Sewer Comm'n (Recovery for Fire Damage to Restaurant from Lack of Water in Fire Hydrant).
W76-06545 6E

DEPOSITION (SEDIMENTS)
Depositional Models and the Shinarump Member and the Sonsela Sandstone Bed of the Chinle Formation Northeastern Arizona and Northwestern New Mexico,
W76-06258 2J

DEPTH
Pumping Test Analysis When Parameters Vary with Depth,
W76-06687 4B

DESALINATION
The Ralph M. Parsons Company Conceptual Design of a 50 MGD Desalination Plant.
W76-06151 3A

Conversion of Desalination Plant Brines to Solids,
W76-06248 3A

Parametric Data for Long Term Operation of a Vertical, Plane Surface, Falling Film, Vapor Compression Evaporator,
W76-06249 3A

Operating Data of a Vertical Plane Surface, Falling Film Evaporator Using Slurry and High Concentration Feeds,
W76-06250 3A

Computational Methods Applicable to the Coupled VTE/MSF Distillation System,
W76-06253 3A

Vertical Tube Distillation Desalting, State-of-the-Art (1971), Nomograph Booklet.
W76-06254 3A

Preliminary Engineering Analysis, Yuma Desalting Plant.
W76-06547 3A

A Standardized Procedure for Estimating Costs of Saline Water Conversion.
W76-06550 3A

Solar Energy Technology, State of the Art, An Annotated Bibliography,
W76-06565 3A

DESALINATION PLANTS
Desalting Plants Inventory, Report No. 4,
W76-06152 3A

Vertical Tube Distillation Desalting, State-of-the-Art (1971).
W76-06255 3A

The Control and Operation of Nuclear Desalination Systems,
W76-06426 3A

10,000,000 Gallon Per Day Secondary Refrigerant Freeze Desalting Plant.
W76-06549 3A

Preliminary Design of a Diesel-Powered Vapor-Compression Plant for Evaporation of Seawater,
W76-06750 3A

DESALINATION PROCESSES
Preliminary Engineering Analysis, Yuma Desalting Plant.
W76-06547 3A

10,000,000 Gallon Per Day Secondary Refrigerant Freeze Desalting Plant.
W76-06549 3A

A Standardized Procedure for Estimating Costs of Saline Water Conversion.
W76-06550 3A

DESERTIFICATION
Desertification: A World Problem,
W76-06592 4C

DESERTS
Desertification: A World Problem,
W76-06592 4C

DESIGN
Marine Pollution Control: Part III--Ship Design Requirements: The Design Approach,
W76-06196 5D

Sediment-Water Microcosms for Assessment of Nutrient Interactions in Aquatic Ecosystems,
W76-06707 5C

DESIGN CRITERIA
The Ralph M. Parsons Company Conceptual Design of a 50 MGD Desalination Plant.
W76-06151 3A

Statistical Design of Equalization Basins,
W76-06297 5D

Anaerobic Digestion of Sludge, Part II,
W76-06344 5D

DESIGN DATA
Washington Waste Works Regulations.
W76-06507 5G

DESIGN STANDARDS
Washington Waste Works Regulations.
W76-06507 5G

DESIGN STORM
Method for Determination of Design Storms with Locally Nonuniform Distribution (Verfahren Zur Ermittlung Eines 'Berechnungsregens' Mit Ortlich Ungleichmaessiger Verteilung),
W76-06299 2A

DETACHED PARTICLES
The Bed-Load Function,
W76-06683 2J

DETERGENTS
Detergent Phosphate Ban Yields Little Phosphorus Reduction, Part II,
W76-06345 5G

Detergent Phosphate Ban Yields Little Phosphorus Reduction, Part III,
W76-06346 5G

Oregon Synthetic Cleansing Agent Act,
W76-06502 6E

Soap and Detergent Manufacturing Category (Pretreatment Standards for Incompatible Pollutants).
W76-06517 5G

DEWATERING
Caernarfon Sludge Goes Up in Smoke,
W76-06291 5E

Process for Dewatering a Proteinaceous, Aqueous Sludge and for Removing and Recovering Precipitating Agents from a Precipitate Containing Proteinaceous Substances,
W76-06478 5D

DIATOMS
Algae in the Gebel Marra Mts in West Sudan,
W76-06206 5C

DIGESTION
Similarities Between the Uptake of Nutrients and Ingestion of Prey,
W76-06723 5C

DIKED DISPOSAL SITES
Buffalo Harbor Diked Disposal Sites: Engineering Properties and Drainage Characteristics,
W76-06666 5E

DIKES
Buffalo Harbor Diked Disposal Sites: Engineering Properties and Drainage Characteristics,
W76-06666 5E

DIMETHYLAMINE (DMA)
Chromatographic Determination of DMA and DMF in Aqueous Medium,
W76-06390 5A

DIMETHYLFORMAMIDE (DMF)
Chromatographic Determination of DMA and DMF in Aqueous Medium,
W76-06390 5A

DINOFLAGELLATES
Observations on Blooms of the Dinoflagellate Gyrodinium Aureolum Hulburt in the River Conway and its Occurrence Along the North Wales Coast,
W76-06245 5C

DIPTERA
A Study of the Benthic Macro-Invertebrates of a Shallow Eutrophic Reservoir in South Wales with Emphasis on the Chironomidae (Diptera); Their Life Histories and Production,
W76-06747 5C

DISCHARGE MEASUREMENT
Inorganic Chemicals Manufacturing Point Source Category.
W76-06514 5G

DISCHARGE STREAMS
Soap and Detergent Manufacturing Category (Pretreatment Standards for Incompatible Pollutants).
W76-06517 5G

DISCHARGE (WATER)
Theory of Weirs,
W76-06416 8B

Washington NPDES Permit Program Regulations,
W76-06510 5G

Effluent Guidelines -- Steam Electric Power Generating Point Source Category.
W76-06513 5G

Effluent Guidelines and Standards - Ferroalloys Manufacturing Point Source Category.
W76-06518 5G

Method for Reducing Single Discharge Measurements to the Average Discharge of the Low-Flow Period,
W76-06679 2E

DISCRETE-SPACE DISCRETE-TIME TECHNIQUE
Pumping Test Analysis When Parameters Vary with Depth,
W76-06687 4B

DISPERSION
Identification and Treatment of Dispersive Clay Soils,
W76-06611 8D

Use of Silver and Zinc to Trace Sewage Sludge Dispersal in Coastal Waters,
W76-06655 5B

Study of the Dispersion of Bacteriophages in a Natural Marine Environment, (In French),
W76-06691 5B

DISPOSAL PRACTICES
Evaluation of Mill Tailings Disposal Practices and Potential Dam Stability Problems in Southwestern United States. Investigation Report, Kennecott Copper Corporation, Chino Leaching Dump, Santa Rita, New Mexico, Volume 4,
W76-06671 8E

DISSOLVED ORGANIC NITROGEN
N and P Distribution in Lake Kinneret (Israel) with Emphasis on Dissolved Organic Nitrogen,
W76-06268 5B

DISSOLVED OXYGEN
Applications of Linear Time Series Models and Stepwise Regression Models to Selected Water Quality Data on the Connecticut River,
W76-06157 5B

Photosynthetic Rates of Phytoplankton in East African Alkaline, Saline Lakes,
W76-06742 5C

DISSOLVED SOLIDS
Disposal of Soluble Inorganic Salts,
W76-06156 5D

Regional Distribution of the Major Dissolved Solids in the Streams of Illinois,
W76-06163 5B

Conversion of Desalination Plant Brines to Solids,
W76-06248 3A

DISTILLATION
Desalting Plants Inventory, Report No. 4,
W76-06152 3A

Parametric Data for Long Term Operation of a Vertical, Plane Surface, Falling Film, Vapor Compression Evaporator,
W76-06249 3A

Computational Methods Applicable to the Coupled VTE/MSF Distillation System,
W76-06253 3A

Vertical Tube Distillation Desalting, State-of-the-Art (1971), Nomograph Booklet.
W76-06254 3A

Vertical Tube Distillation Desalting, State-of-the-Art (1971).
W76-06255 3A

Automatic Water Distiller,
W76-06469 5F

Solar Energy Technology, State of the Art, An Annotated Bibliography,
W76-06565 3A

DISTRIBUTION
Regional Distribution of the Major Dissolved Solids in the Streams of Illinois,
W76-06163 5B

The Winter Distribution of Ultra-Violet Absorption in the Surface Waters off the West Coast of the British Isles,
W76-06739 5B

Seasonal Distribution of Ultraviolet Absorption in the Surface Waters of Liverpool Bay,
W76-06740 5B

Vegetation in Lake Tamnaren: Interpretation of Aerial Photos and Description of the Vegetation, (In Swedish),
W76-06781 2H

DISTRIBUTION PATTERNS
Regional Distribution of the Major Dissolved Solids in the Streams of Illinois,
W76-06163 5B

Ecology and Biogeography of Mayflies (Ephemeroptera) of Running Waters in the Polish Part of the Carpathians. 1. Distribution and Quantitative Analysis,
W76-06216 5C

Optimal Distribution of Assimilates During Limited Water Supply: A Mathematical Mode, (In Russian),
W76-06786 2I

Effects of Antitranspirants on Distribution and Utilization of Photosynthate in Pinus Resinosa Seedlings,
W76-06792 2I

DISTRIBUTION SYSTEMS
Water-Distribution-System Corrosion Control,
W76-06276 8G

DIURNAL
The Importance of Diurnal Variation of Photosynthesis vs. Light Curves to Estimates of Integral Primary Production,
W76-06210 5C

DIVERSION
Arnett V Commonwealth Department of Highways (Liability for Damages to Crops Caused by Diversion of Water Resulting from Bridge Construction).
W76-06539 6E

DIVERSION STRUCTURES
Inflatable Water-Retaining Barrier,
W76-06462 8A

DIYALA BASIN (IRAQ)
Characteristics and Classification of Two Soils in Diyala Basin, Iraq,
W76-06580 2G

DIYALA RIVER BASIN (IRAQ)
Soil Moisture Regime of Unsaturated Zone in Some Arid Regions,
W76-06578 2G

DNA
Taxonomy of Klebsiella pneumoniae Isolated from Pulp/Paper Mill Wastewater,
W76-06645 5C

DNIEPER RIVER (USSR)
Formation of Water and Sediment Discharge During the Spring Flood on a Slope and in a Small Gully-Ravine Drainage Basin,
W76-06176 2J

DOCKS
Comstock V. Wheelock ('Highway by User' Statute Not Applicable to Give Public Prescriptive Right to Lake Property).
W76-06544 6E

DOMESTIC WASTES
Sewage Treatment Apparatus,
W76-06481 5D

DON RIVER BASIN (USSR)
Experiment in Applying Correlation Analysis to the Description of the Temporal Variations of Snow Melting Intensity in the Don River Basin,
W76-06173 2C

DRAINAGE
Drainage Rates from a Vertical Column,
W76-06165 2F

Buffalo Harbor Diked Disposal Sites: Engineering Properties and Drainage Characteristics,
W76-06666 5F

DRAINAGE BASINS
Atlas of Arizona.

W76-06656

FLORIDA COASTAL ZONE

Inventory of Florida Coastal Zone Planning Publications: Volume I, Coastal Counties and Cities.
W76-06566

Inventory of Florida Coastal Zone Planning Publications: Volume II, Multi-County Planning Districts.
W76-06567

Inventory of Florida Coastal Zone Planning Publications: Volume III, Statewide.
W76-06568 2L

FLORIDAN AQUIFER
Solution Chemistry, Mass Transfer, and the Approach to Chemical Equilibrium in Porous Carbonate Rocks and Sediments,
W76-06384 2K

FLOW
Measurement of the Structure of River Flow,
W76-06180 2E

FLOW CONTROL
Advances in Hydroscience, Volume 10-1975.
W76-06412 8B

Theory of Weirs,
W76-06416 8B

FLOW EQUALIZATION
Evaluation of In-Line and Side-Line Flow Equalization Systems,
W76-06348 5D

FLOW MEASUREMENT
Theory of Weirs,
W76-06416 8B

FLOW RESISTANCE
Skin Friction in Unsteady Laminar Pipe Flow,
W76-06389 8B

FLOWERING
Observations on Blooms of the Dinoflagellate Gyrodinium Aureolum Hulburt in the River Conway and its Occurrence Along the North Wales Coast,
W76-06245 5C

FLUID MECHANICS
Statistics of Random Wave Field,
W76-06397 8B

FLUVIAL SEDIMENTS
Initiation of Bed Forms and Meanders in Coarse-Grained Sediment,
W76-06385 2J

FOAM SEPARATION
Automatic Foam Remover for Flotation Tanks,
W76-06474 5D

FOOD PROCESSING INDUSTRY
Infrared Dry Caustic Vs. Wet Caustic Peeling of White Potatoes,
W76-06652 5D

FORECAST PROCEDURES
Operational Ice Forecast for the Little Rapids Cut,
W76-06658 2C

FORECASTING
A Practical Monthly Optimum Operations Model,
W76-06436 4A

Development of Methodology for Evaluation and Prediction of Avalanche Hazard in the San Juan Mountain Area of Southwestern Colorado,
W76-06605 2C

Lake Location and Quality as Determinants of Potential Recreation Benefits: A Study of Selected Lakes in Manitoba,
W76-06622 6B

Hydrological Forecasting Practices.
W76-06633 2A

FOREIGN COUNTRIES
Economic Benefits of Potable Water Supplies in Rural Areas of Developing Countries,
W76-06230 6B

Japan and the United Nations Conference on the Law of the Sea,
W76-06491 6E

FOREIGN PROJECTS
Hydrologic Evaluation of Salinity Control and Reclamation Projects in the Indus Plain, Pakistan--A Summary,
W76-06453 5G

FOREST IRRIGATION
Water Pollution Abatement Through Forest Irrigation with Municipal Waste Water,
W76-06668 5D

FOREST MANAGEMENT
Water as a Forest Product,
W76-06200 4A

The Effect of Forest on Minimum River Runoff in the Broad-Leaved Forest Zone and Forest-Steppe of the European Part of the USSR, (In Russian),
W76-06783 4C

FORESTS
Determination of the Dates of Snow Disappearance in the Forest,
W76-06174 2C

FORT NELSON RIVER
Flood of June 1971 Fort Nelson and Muskwa Rivers,
W76-06367 2E

FRANCE (MARSEILLES)
Sequences of Effects of a City Sewer: As a Function of the Removal of the Source of Pollution, on the Photophile Populations Growing in Exposed Places (Algal Fraction); First Results, (In French),
W76-06770 5C

FREE SURFACES
Statistics of Random Wave Field,
W76-06397 8B

FREEZING
Desalting Plants Inventory, Report No. 4,
W76-06152 3A

10,000,000 Gallon Per Day Secondary Refrigerant Freeze Desalting Plant.
W76-06549 3A

FRESHWATER MARSHES
Dynamics of Marsh Land Formation and Succession Along the Lower Colorado River and Their Importance and Management Problems as Related to Wildlife in the Arid Southwest,
W76-06589 4A

FRICTION COEFFICIENT
Skin Friction in Unsteady Laminar Pipe Flow,
W76-06389 8B

FURROW IRRIGATION
Seedbed Soil Salinity and Emergence of Peppers and Carrots Under Sprinkler and Furrow Irrigation,
W76-06305 3C

FUTURE PLANNING (PROJECTED)
Kaneoche Alternatives: An Application of Impact Methodology.
W76-06574 6G

FWPCA AMENDMENTS OF 1972
Nat. Res. Def. Council V. Train. (Federal Water Pollution Act Amendments).
W76-06523 6E

GAGE NETWORK
Lake Huron Beginning-of-Month Water Levels and Monthly Rates of Change of Storage,
W76-06657 2H

GAMMA MEASUREMENTS
Development of Snow Water Equivalent Survey Methods Using Airborne Gamma Measurements,
W76-06659 2C

GAMMA RADIATION
Soil Moisture Survey Experiment at Luverne Minnesota, Date of Survey: May 12, 1975,
W76-06663 2G

GAMMA-RAY TRANSMISSION TECHNIQUE
Water Content and Bulk Density Changes in a Soil Pedon Measured with Dual Energy Gamma-Ray Transmission,
W76-06238 5G

GAS CHROMATOGRAPHY
Chromatographic Determination of DMA and DMF in Aqueous Medium,
W76-06390 5A

Analytical Quality Assurance for Trace Organics Analysis by Gas Chromatography/Mass Spectrometry,
W76-06648 5A

GASES
Hot Springs of Rhodesia: Their Noble Gases, Isotopic and Chemical Composition,
W76-06190 2K

GEBEL MARRA (SUDAN)
Algae in the Gebel Marra Mts in West Sudan,
W76-06206 5C

GEOLOGIC FORMATIONS
Depositional Models and the Shinarump Member and the Sonsela Sandstone Bed of the Chinle Formation Northeastern Arizona and Northwestern New Mexico,
W76-06258 2J

Surface Runoff and its Effect on Diffuse Salt Production From Mancos Shale Members,
W76-06583 2G

GEOLOGY
Geologic and Water-Supply Reports and Maps--Wyoming, July 1975,
W76-06456 10C

GEOMORPHOLOGY
Some Characteristics of the Process of Incomplete Meandering of the Channel of the Upper OB' River,
W76-06178 4A

Depositional Models and the Shinarump Member and the Sonsela Sandstone Bed of the Chinle Formation Northeastern Arizona and Northwestern New Mexico,
W76-06258 2J

Initiation of Bed Forms and Meanders in Coarse-Grained Sediment,
W76-06385 2J

Thick BH Horizons in the North Carolina Coastal Plain: I. Morphology and Relation to Texture and Soil Ground Water,
W76-06402 2G

GEOMORPHOLOGY

Analysis and Interpretation of Littoral Environment Observation (Leo) and Profile Data Along the Western Panhandle Coast of Florida,
W76-06637 2L

GEORGIA

Water Resources Data for Georgia, Water Year 1975,
W76-06451 7C

An Economic Analysis of Georgia's Marine Charter Boat Fishing Industry,
W76-06624 6C

GEOTHERMAL STUDIES

Bibliography of Studies on the Density and Other Volumetric Properties for Major Components in Geothermal Waters, 1928-1974,
W76-06454 4B

Geothermal Power System and Method,
W76-06472 3E

GERMINATION

Seed Germination, Respiration and Mitochondrial Efficiency of Three Alfalfa (Medicago Sativa L.) Cultivars Subjected to NACL Salinity,
W76-06264 3C

GHANA

The Role of Groundwater in Rural Supplies in Ghana,
W76-06169 4B

GLACIER LAKES

The Water Fauna of the High Mountain Glacier Lakes in the Mandaras Valley in the High Hindu Kush, (In Polish),
W76-06166 5C

GLACIERS

Preliminary Hydrography and Historic Terminal Changes of Columbia Glacier, Alaska,
W76-06449 7C

GLACIOLOGY

Research Projects in Glaciology - 1974,
W76-06368 2C

GOAL PROGRAMMING

Planning and Selecting Multiobjective Projects by Goal Programming,
W76-06432 6A

GOVERNMENT FINANCE

Cost-Benefit Rules in General Equilibrium,
W76-06625 6B

GOVERNMENTAL INTERRELATIONS

Pareto Optimality, Pure Public Goods, Impure Public Goods and Multiregional Spillovers,
W76-06620 6B

GRAPHICAL ANALYSIS

Multivariate and Sequential Statistical Procedures in the Biological Assessment of Water Quality,
W76-06561 5A

GRASSLANDS

The Origin and Development of Waterlogged Meadows in the Central Part of the Sumava Foothills,
W76-06247 2I

Ecological Effects of Weather Modification: Effect of Late Snowmelt on Festuca Idahoensis Elmer Meadows,
W76-06756 3B

GRAUPEL GROWTH

Production of Secondary Ice Particles During the Growth of Graupel by Riming,
W76-06168 2B

GRAVEL PIT LAKES

The Bacterial Composition, and the Metabolic Activity of Some Physiological Groups of Bacteria in Two Gravel Pit Lakes,
W76-06749 5C

The Microflora of Aerobic Bacteria in Gravel Pit Lakes, (In German),
W76-06777 5C

GRAVITY WAVES

Statistics of Random Wave Field,
W76-06397 8B

GRAZING

The Rationale of Nomad Economy,
W76-06591 4C

The Effects of a Benthic Grazer on the Primary Productivity of the Littoral Zone of Lake Tahoe,
W76-06719 5C

GREAT LAKES

Transmissometer Measurements of the Great Lakes,
W76-06370 7B

GREAT LAKES REGION

How the Great Lakes were Evaluated,
W76-06329 5G

GREAT PLAINS

Northern Great Plains Resource Program, Water Work Group Report.

LEMONS
Effects of Nitrogen, Potassium and Irrigation on Yield and Quality of Lemon,
W76-06314 3F

LETTUCE
The Effect of Irrigation on the Length, Weight and Diameter of Lettuce Roots,
W76-06798 3F

LIFE CYCLES
A Study of the Benthic Macro-Invertebrates of a Shallow Eutrophic Reservoir in South Wales with Emphasis on the Chironomidae (Diptera); Their Life Histories and Production,
W76-06747 5C

LIGHT
A Photochemical Side Reaction That Interferes with the Phenolhypochlorite Assay for Ammonia,
W76-06712 5A

Flooding Effects on Light Reflectance, Transmittance, and Absorptance of Cotton (Gossypium Hirsutum) Leaves,
W76-06794 2I

LIGHT EXTINCTION EQUATION
On the Universality of the Poole and Atkins Secchi Disk-Light Extinction Equation,
W76-06737 5A

LIGHT INTENSITY
The Importance of Diurnal Variation of Photosynthesis vs. Light Curves to Estimates of Integral Primary Production,
W76-06210 5C

Empirical Functions Relating Metabolic Processes in Aquatic Systems to Environmental Variables,
W76-06755 5C

LIGHT PENETRATION
On the Universality of the Poole and Atkins Secchi Disk-Light Extinction Equation,
W76-06737 5A

LIME
Chemical Composition and Yield of Soybeans as Affected by Irrigation and Deep Placement of Lime, Phosphorus and Potassium,
W76-06338 3C

LIMNOLOGY
Sediment-Water Microcosms for Assessment of Nutrient Interactions in Aquatic Ecosystems,
W76-06707 5C

Limnological and Morphological Relationships Between Water and River Bed in the Lower Course of the Thur River, (In German),
W76-06736 2E

LINEAR PROGRAMMING
Water Quality Control System of Zagyva River Basin,
W76-06430 5G

LIQUID CONCENTRATES
Effluent Limitations and Guidelines - Printing Ink Formulating Point Source Category.
W76-06520 5G

LITTLE MIAMI RIVER (OHIO)
Loess in Ohio in Relation to Several Possible Source Areas: I. Physical and Chemical Properties,
W76-06399 2J

Loess in Ohio in Relation to Several Possible Source Areas: II. Elemental and Mineralogical Composition,
W76-06400 2J

LITTORAL
Wernberg V State (Payment of Just Compensation for Taking of Littoral Property Rights).
W76-06531 6E

The Effects of a Benthic Grazer on the Primary Productivity of the Littoral Zone of Lake Tahoe,
W76-06719 5C

LITTORAL DRIFT
Analysis and Interpretation of Littoral Environment Observation (Leo) and Profile Data Along the Western Panhandle Coast of Florida,
W76-06637 2L

LIVESTOCK
The Rationale of Nomad Economy,
W76-06591 4C

LOESS
Loess in Ohio in Relation to Several Possible Source Areas: I. Physical and Chemical Properties,
W76-06399 2J

Loess in Ohio in Relation to Several Possible Source Areas: II. Elemental and Mineralogical Composition,
W76-06400 2J

LONG ISLAND (NY)
Planning a Must for Groundwater Development,
W76-06273 4B

LONG ISLAND SOUND (CONN)
An Investigation of Suspended Material Concentrations in Eastern Long Island Sound,

PHOSPHORUS COMPOUNDS
Infiltration of Organic Phosphate Compounds in Soil,
W76-06170 5B

PHOSPHORUS FERTILIZERS
Infiltration of Organic Phosphate Compounds in Soil,
W76-06170 5B

PHOSPHORUS INPUT GUIDELINES
The Relationships of Phosphorus and Nitrogen to the Trophic State of Northeast and North-Central Lakes and Reservoirs.
W76-06220 5C

PHOSPHORUS SOURCES
Phosphorus Sources for the Lower Madison Lakes,
W76-06718 5B

PHOSPHORYLATION
The Biogeochemistry of Phosphorus in an Experimental Lake Environment: Evidence for the Formation of Humic-Metal-Phosphate Complexes,
W76-06203 5C

PHOTOSYNTHATE
Effects of Antitranspirants on Distribution and Utilization of Photosynthate in Pinus Resinosa Seedlings,
W76-06792 2I

PHOTOSYNTHESIS
The Importance of Diurnal Variation of Photosynthesis vs. Light Curves to Estimates of Integral Primary Production,
W76-06210 5C

Photosynthetic Rates of Phytoplankton in East African Alkaline, Saline Lakes,
W76-06742 5C

PHRAGMITES-COMMUNIS
Inland Waters, Specific Presentations from Limnology and Related Fields, Vol. 27. The Reed Phragmites Communis Trinius, (In German),
W76-06741 2I

PHYSICAL OCEANOGRAPHIC DATA
Fortran Graphics Programs for Physical Oceanographic and Time Series Data,
W76-06661 7C

PHYSICAL PROPERTIES
Water Quality Data Alberta 1961 - 1973.
W76-06374 7C

Thick BH Horizons in the North Carolina Coastal Plain: II: Physical and Chemical Properties and Rates of Organic Additions from Surface Sources,
W76-06403 2G

Physical and Climatic Characteristics Along Kansas Streams,
W76-06450 7C

Penetration of the Deep Layer of the Saguenay Fjord by Surface Waters of the St. Lawrence Estuary,
W76-06674 2L

PHYSICAL PROPERTY
Loess in Ohio in Relation to Several Possible Source Areas: I. Physical and Chemical Properties,
W76-06399 2J

PHYSIOCHEMICAL PROPERTIES
Thermodynamic Properties of Bulk and Occluded SuperiCooled Water and Ionic Solutions,
W76-06155 1A

PHYTOPLANKTON
The Phytoplankton and Primary Productivity of Southern Indian Lake (Manitoba), A High Latitude, Riverine Lake,
W76-06204 5C

Phytoplankton Biomass and Distribution in a Shallow Eutrophic Lake (Lake George, Uganda),
W76-06246 5C

Photosynthetic Rates of Phytoplankton in East African Alkaline, Saline Lakes,
W76-06742 5C

Control of Species Composition in Enriched Mass Cultures of Natural Phytoplankton Populations,
W76-06757 5C

Observations and Experiments on the Phytoplankton of Blelham Tarn, English Lake District I. The Experimental Tubes,
W76-06758 5C

PICLORAM
Lateral Loss of Picloram and 2,4-D from a Forest Podsol During Rainstorms,
W76-06197 5B

PINE TREES
Effects of Antitranspirants on Distribution and Utilization of Photosynthate in Pinus Resinosa Seedlings,
W76-06792 2I

PIPE FLOW
Skin Friction in Unsteady Laminar Pipe Flow,
W76-06389 8B

PIPELINES
Wave Forces on Bottom-Mounted Large-Diameter Cylinder,
W76-06395 8B

PISUM-SATIVUM
Localization of Damage Incurred During Water Imbibition by Pisum Sativum and Zea Mays Seeds, as Revealed by the Topographic Tetrazolium Test,
W76-06649 2I

PLANKTON
Annual Development of Plankton in a River Water Intake Weir and in a Treatment Pond and its Removal in Treatment Plants,
W76-06211 5C

Production of Planktonic Crustaceans of Two Secondary Oligotrophic Lakes, (In Russian),
W76-06301 5C

Differences in Chemical Composition Between Two Species of Daphnia and Some Freshwater Algae Cultured in the Laboratory,
W76-06713 5C

PLANNING
Water Quality Management for Metropolitan Kansas City,
W76-06323 5G

Public Involvement in the Corps of Engineers Planning Process,
W76-06417 6B

Application of Multi-Regional Planning Models to the Scheduling of Large-Scale Water Resource Systems Development,
W76-06425 6A

Planning and Selecting Multiobjective Projects by Goal Programming,
W76-06432 6A

Water Plan Ranking and the Public Interest,
W76-06438 6B

Water Quality Planning Strategy,
W76-06439 5G

Washington Water Pollution Control Planning Regulations.
W76-06508 5G

Cognitive Strawman: Public Input to a Water Resource Planning System,
W76-06548 6B

Inventory of Florida Coastal Zone Planning Publications: Volume I, Coastal Counties and Cities.
W76-06566 2L

Annual Report 1974.
W76-06572 6B

PLANNING DISTRICTS
Inventory of Florida Coastal Zone Planning Publications: Volume II, Multi-County Planning Districts.
W76-06567 2L

Inventory of Florida Coastal Zone Planning Publications: Volume III, Statewide.
W76-06568 2L

PLANT DISEASES
Correlation Between Sowing Time and Weather Factors on the Intensity of Groundnut Diseases,
W76-06800 3F

PLANT GROWTH
Effects of Fertilization and Irrigation on Yield and Potassium Content of Alfalfa and on Available Soil Potassium,
W76-06243 3F

Saltcedar (Tamarix Chinensis) Seed Production, Seedling Establishment, and Response to Inundation,
W76-06590 3B

Influence of Vesicular Horizons on Watershed Management,
W76-06596 4D

PLANT MORPHOLOGY
Identification and Management of Eurasian Water Milfoil in Wisconsin,
W76-06725 5C

PLANT PHYSIOLOGY
Water Relations of Selected Species of Chaparral and Coastal Sage Communities,
W76-06259 3B

Seed Germination, Respiration and Mitochondrial Efficiency of Three Alfalfa (Medicago Sativa L.) Cultivars Subjected to NACL Salinity,
W76-06264 3C

Effects of Water Stress on Leaf Respiration, Transpiration Rates in the Dark and Cuticular Resistance to Water Vapor Diffusion of Two Corn Inbreds,
W76-06266 2D

Relationship Between Plant Respiration and Water Metabolism, (In Russian),
W76-06789 2I

PLANT POPULATIONS
The Impact of Overwinter Drawdown on the Aquatic Vegetation of the Chippewa Flowage, Wisconsin,
W76-06711 4A

PLATS
Sample Subdivision Control Ordinance for Flood Hazard Areas.
W76-06494 6F

POLAND
Ecology and Biogeography of Mayflies (Ephemeroptera) of Running Waters in the Polish Part of the Carpathians. 1. Distribution and Quantitative Analysis,
W76-06216 5C

Problem of Selecting Indices for the Reliability of Water Supply and Sewer Networks, Part I (Zacadnienie wyboru wskaznikow niezawodnosci systemow wodociagowych i kanalizacyjnych. czesc I),
W76-06313 5F

POLICE POWER
Wernberg V State (Payment of Just Compensation for Taking of Littoral Property Rights).
W76-06531 6E

POLITICAL ASPECTS
The Political Economy of Effluent Charges,
W76-06228 5G

POLLUTANT IDENTIFICATION
Acetylene Reduction Assays for Nitrogen Fixation in Freshwaters: A Note of Caution,
W76-06202 5A

A Technique for Estimating Active Nitrifying Mass and its Application in Designing Nitrifying Systems,
W76-06296 5A

Nitrosophenol and Nitrosonaphthol Derivatives as Reagents for Spectrophotometric Determination of Iron and Determination of Micro-Amounts in Waters with 2-Nitroso-5-Dimethylaminophenol,
W76-06303 5A

Cadmium and Zinc Contents of Corn Leaf and Grain Produced by Sludge-Amended Soil,
W76-06304 5A

Chemical Analysis and Environmental Quality,
W76-06308 5A

Measurement in Water Research: Part 1.
W76-06310 5A

Earthwatch,
W76-06321 5A

Behaviour of Oil under Canadian Climatic Conditions Part 1. Oil on Water under Ice-Forming Conditions,
W76-06366 5G

Examination of Sewage and Sewage Sludge for Enteroviruses, Volume 1.
W76-06371 5A

Chromatographic Determination of DMA and DMF in Aqueous Medium,
W76-06390 5A

In Regard to the Question of the Determination of Heavy Metals in River Waters with the Aid

of Radionuclide X-Ray Fluoresence Analysis, (In German),
W76-06619 5A

Environmental Applications of Advanced Instrumental Analysis: Assistance Projects, FY 74,
W76-06647 5A

Analytical Quality Assurance for Trace Organics Analysis by Gas Chromatography/Mass Spectrometry,
W76-06648 5A

Chemical/Biological Relationships Relevant to Ecological Effects of Acid Rainfall,
W76-06650 5A

Automatic Organic Monitoring System for Storm and Combined Sewers,
W76-06651 5A

Teledetection by Airplane and Satellite in the Study of Marine Pollution, (In French),
W76-06717 5A

Thermodynamic Limitations on the Use of the Platinum Electrode in Eh Measurements,
W76-06738 5A

Determination of Parts Per Billion Sulfide in Water with the Sulfide-Selective Electrode,
W76-06744 5A

Neutron Activation Analysis of Some of the Biologically Active Trace Elements in Fish,
W76-06753 5A

POLLUTANTS

Ferroalloy Manufacturing Point Source Category.
W76-06519 5G

Water Quality Model for Small Agricultural Watershed,
W76-06641 5B

POLLUTION ABATEMENT

Development of an Economic/Environmental Plan for Dents Run Watershed, West Virginia.
W76-06270 5G

The Common Law of Public Nuisance in State Environmental Litigation,
W76-06488 6E

Evaluation of Pollution Abatement Techniques Applicable to Lost Creek and Brown's Creek Watershed, West Virginia.
W76-06570 5G

Development of a Priority Determination Procedure.
W76-06571 5G

POLLUTION TAXES (CHARGES)

The Role of Pollutee Taxes in Externality Problems,
W76-06226 5G

The Political Economy of Effluent Charges,
W76-06228 5G

Corrective Taxes for Pollution Control: An Application of the Environmental Pricing and Standards Systems to Agriculture,

W76-06321 5A

Practical Research in Water Pollution Control,
W76-06340 5D

Planning Water Resources Research Programs,
W76-06440 6B

Reorientation of Urban Water Resources Research, Final Report,
W76-06553 6B

Reorientation of Urban Water Resources Research, Executive Summary,
W76-06554 6B

Applications of Aerospace Technology in the Public Interest: Pollution Measurement,
W76-06710 5C

RESEARCH FACILITIES
Research Projects in Glaciology - 1974,
W76-06368 2C

RESEARCH POLICY
Reorientation of Urban Water Resources Research, Final Report,
W76-06553 6B

Reorientation of Urban Water Resources Research, Executive Summary,
W76-06554 6B

RESEARCH PRIORITIES
Snow Avalanche Hazard in the United States: A Research Assessment.
W76-06195 2C

Reorientation of Urban Water Resources Research, Final Report,
W76-06553 6B

Reorientation of Urban Water Resources Research, Executive Summary,
W76-06554 6B

RESERVOIR DESIGN
Controlling Reservoir Trap Efficiency,
W76-06682 8B

RESERVOIR RELEASES
Erosion and Sediment Transport in the Owens River Near Bishop, California,
W76-06458 2J

RESERVOIR SILTING
Controlling Reservoir Trap Efficiency,
W76-06682 8B

RESERVOIR STORAGE
Long-Term Operation of Storage Hydro Projects,
W76-06434 4A

RESERVOIRS
The Planktonic Crustaceans of Moncove Lake, Monroe County, W. Va.,
W76-06214 5C

Control of a River System with Two Storage Reservoirs,
W76-06422 4A

RESOURCE ALLOCATION
Externalities and Coase Theorem: A Graphical Analysis,
W76-06621 6C

RESOURCES
The Economic Value of Remote Sensing of Earth Resources from Space: An Erts Overview and the Value of Continuity of Service. Volume IX. Oceans.
W76-06222 7B

RESPIRATION
Seed Germination, Respiration and Mitochondrial Efficiency of Three Alfalfa (Medicago Sativa L.) Cultivars Subjected to NACL Salinity,
W76-06264 3C

Effects of Water Stress on Leaf Respiration, Transpiration Rates in the Dark and Cuticular Resistance to Water Vapor Diffusion of Two Corn Inbreds,
W76-06266 2D

Relationship Between Plant Respiration and Water Metabolism, (In Russian),
W76-06789 2I

RETURN FLOWS
Preliminary Engineering Analysis, Yuma Desalting Plant.
W76-06547 3A

RETURN (MONETARY)
An Economic Analysis of Georgia's Marine Charter Boat Fishing Industry,
W76-06624 6C

REVERSE OSMOSIS
Evaluation of Pollution Abatement Techniques Applicable to Lost Creek and Brown's Creek Watershed, West Virginia.
W76-06570 5G

REVIEWS
Review of Heated Discharge Management and Control Alternatives, Once-Through Systems in Large Water Bodies.
W76-06372 5B

Bibliography of Studies on the Density and Other Volumetric Properties for Major Components in Geothermal Waters, 1928-1974,

Water Harvesting: State of the Art,
W76-06584 3B

State-Of-The-Art Survey and Evaluation of Marsh Plant Establishment Techniques: Induced and Natural; Volume I: Report of Research,
W76-06635 4A

State-of-the-Art Survey and Evaluation of Marsh Plant Establishment Techniques: Induced and Natural; Volume II: A Selected Annotated Bibliography on Aquatic and Marsh Plants and their Management,
W76-06636 4A

RHINE RIVER (W GERMANY)
The 'Rheinschnaken' (Diptera, Culicidae) Species, Life Style, Ecology, Mass Development, and Control, (In German),
W76-06768 2I

RHIZOCLONIUM
The Effect of Bacterial Substances on the Growth of Two Cladophoraciae in Pure Culture, (In German),
W76-06779 5C

RHODESIA
Hot Springs of Rhodesia: Their Noble Gases, Isotopic and Chemical Composition,
W76-06190 2K

RHODOPHYTA
Algae in the Gebel Marra Mts in West Sudan,
W76-06206 5C

RIME
Production of Secondary Ice Particles During the Growth of Graupel by Riming,
W76-06168 2B

Ice Particle Multiplication in Cumulus Clouds,
W76-06678 2B

RIO GRANDE RIVER
A Socio-Economic Evaluation of Alternative Water Management Policies on the Rio Grande in New Mexico,
W76-06644 6B

RIO GRANDE VALLEY (N MEX)
Cognitive Strawman: Public Input to a Water Resource Planning System,
W76-06548 6B

RIPARIAN LAND
Pierce V Riley (Access to Lake by Nonriparian Owners Impermissible Even Though over the Land of a Riparian Owner).
W76-06532 6E

RIPARIAN PLANTS
Saltcedar (Tamarix Chinensis) Seed Production, Seedling Establishment, and Response to Inundation,
W76-06590 3B

RIPARIAN RIGHTS
Wernberg V State (Payment of Just Compensation for Taking of Littoral Property Rights).
W76-06531 6E

Pierce V Riley (Access to Lake by Nonriparian Owners Impermissible Even Though over the Land of a Riparian Owner).
W76-06532 6E

RIPRAP STABILITY
Large Wave Tank Tests of Riprap Stability,
W76-06410 8B

RISKS
Economic and Legal Analysis of Alternative Flood Control Strategies: Phase I,
W76-06159 6F

On a Stochastic Model to Estimate Tsunami Risk,
W76-06189 2L

Release Control Policy for a Large Lake Subject to Wind Waves,
W76-06421 4A

Uncertainties in Karstic Water Resources Systems,
W76-06595 2F

A Note on Uncertainty and the Evaluation of Public Investment Decisions,
W76-06617 6C

RIVER
Formulation and use of Practical Models for River Quality Assessment,
W76-06209 5G

RIVER BASIN COMMISSIONS
Borough of Morrisville V. Delaware River Basin Commission (1958 Federal Water Supply Act, Surface Water Use).
W76-06537 6E

RIVER BASIN DEVELOPMENT
Cooperative Management and Development of International River Basins,
W76-06428 4A

River Basin Development for Socio-Economic Growth,
W76-06429 4A

Environmental Management for the Metropolitan Area Cedar-Green River Basins, Washington, Part II: Urban Drainage.
W76-06573 6G

RIVER BASINS
An Approach to a Water Quality Index for Canada,
W76-06272 5G

Viability of Existing Water Resource Models, The Potomac River Basin Water Supply Alternatives,
W76-06424 6A

RIVER BEDS
The Bed-Load Function,
W76-06683 2J

Limnological and Morphological Relationships Between Water and River Bed in the Lower Course of the Thur River, (In German),
W76-06736 2E

RIVER CLYDE (SCOTLAND)
Impact of the Sewage Workers' Strike on the River Clyde,
W76-06281 5C

RIVER FLOW
Atlas of Arizona.
W76-06263 7C

RIVER SYSTEMS
Control of a River System with Two Storage Reservoirs,
W76-06422 4A

Water Quality Control System of Zagyva River Basin,
W76-06430 5G

RIVER YSTWYTH (WALES)
Initiation of Bed Forms and Meanders in Coarse-Grained Sediment,
W76-06385 2J

RIVERHEAD (NY)
Planning a Must for Groundwater Development,
W76-06273 4B

RIVERINE LAKES
The Phytoplankton and Primary Productivity of Southern Indian Lake (Manitoba), A High Latitude, Riverine Lake,
W76-06204 5C

RIVERS
Sediment Reservoirs in the Channels of Small Mountain Rivers,
W76-06177 2J

Some Characteristics of the Process of Incomplete Meandering of the Channel of the Upper OB' River,
W76-06178 4A

Measurement of the Structure of River Flow,
W76-06180 2E

Changes in Water Quality in Finnish Lakes and Rivers 1962-1973 (in Finnish with English Summary),
W76-06212 5C

Ecology and Biogeography of Mayflies (Ephemeroptera) of Running Waters in the Polish Part of the Carpathians. 1. Distribution and Quantitative Analysis,
W76-06216 5C

Sediment Data, Canadian Rivers 1972.
W76-06376 7C

Water Resources Development of International Rivers with Special Reference to the Developing World,
W76-06486 4A

Application of Algal Assays to Define the Effects of Wastewater Effluents upon Algal Growth in Multiple use River Systems,

RIVERS AND HARBORS ACT
Sierra Club V. Morton (Prohibition of Dams and Dikes Across Navigable Waters Under River and Harbors Act of 1899).
W76-06540 6E

ROOT ZONE
Localization of Damage Incurred During Water Imbibition by Pisum Sativum and Zea Mays Seeds, as Revealed by the Topographic Tetrazolium Test,
W76-06649 2I

ROOTS
The Influence of High Salt Concentrations on Various Physiologic Paramters of Maize Roots, (In German),
W76-06790 3C

ROSS ICE SHELF (ANTARCTICA)
Sediments Exposed on the Surface of the Ross Ice Shelf, Antarctica,
W76-06188 2C

ROTIFERS
A Method of Determining Morphophysiological Indicators in the Ecology of Rotifers (Rotatoria), (In Russian),
W76-06231 5A

RUNNING WATERS
The Stream and its Valley,
W76-06722 2A

RUNOFF
Role of Bogs in the Formation of Spring Flood Runoff Losses in the Drainage Basins of the Northwestern European USSR,
W76-06175 4A

Formation of Water and Sediment Discharge During the Spring Flood on a Slope and in a Small Gully-Ravine Drainage Basin,
W76-06176 2J

Meltwater Losses Through Infiltration into Podzolic Soils and Chernozems,
W76-06181 2G

Seasonal Streamflow Estimation Employing Satellite Snowcover Observations,
W76-06638 4A

Synthesis of Basin Response with Inadequate Data,
W76-06675 2A

The Effect of Forest on Minimum River Runoff in the Broad-Leaved Forest Zone and Forest-Steppe of the European Part of the USSR, (In Russian),
W76-06783 4C

RURAL AREAS
The Role of Groundwater in Rural Supplies in Ghana,
W76-06169 4B

Economic Benefits of Potable Water Supplies in Rural Areas of Developing Countries,
W76-06230 6B

RURAL WATER SUPPLIES
The Role of Groundwater in Rural Supplies in Ghana,
W76-06169 4B

SAFE DRINKING WATER ACT
Interim Primary Drinking Water Standards.
W76-06522 5G

SAFE DRINKING WATER ACT OF 1974
EPA Standards: Health or Headache,
W76-06489 5G

SAFE YIELD
Groundwater Resources of Altun-Kupri Area,
W76-06576 4B

SAGEBRUSH
Water Relations of Selected Species of Chaparral and Coastal Sage Communities,
W76-06259 3B

SALINE LAKES
Photosynthetic Rates of Phytoplankton in East African Alkaline, Saline Lakes,
W76-06742 5C

SALINE SOILS
Seedbed Soil Salinity and Emergence of Peppers and Carrots Under Sprinkler and Furrow Irrigation,
W76-06305 3C

Effect of Salinization on Certain Soil Microflora,
W76-06582 5C

SALINE WATER
Effect of Saline Water Irrigation on N.Co310 and H50-7209 Cultivars of Sugarcane: II. Chemical Composition of Plants,
W76-06274 3C

A Proposal for Future Utilization of Tharthar Lake Water,
W76-06577 3C

SALINITY
Salinities of Ambient and Interstitial Waters of Some Massachusetts North Shore Salt-Marshes,
W76-06158 5B

Salinity-Ozone Interactive Effects on Alfalfa Yield and Water Relations,
W76-06269 3C

Effects of Salinity on Nitrification in the East River,
W76-06335 5C

The Salinity Effect in a Mixed Layer Ocean Model,
W76-06393 2L

Temperature and Salinity Structure in the Weddell Sea,
W76-06394 2L

Hydrologic Evaluation of Salinity Control and Reclamation Projects in the Indus Plain, Pakistan--A Summary,
W76-06453 5G

Water Quality Standards--Colorado River System (Salinity Control Policy and Standards Procedure).
W76-06512 5G

Surface Runoff and its Effect on Diffuse Salt Production From Mancos Shale Members,
W76-06583 2G

The Winter Distribution of Ultra-Violet Absorption in the Surface Waters off the West Coast of the British Isles,
W76-06739 5B

Seasonal Distribution of Ultraviolet Absorption in the Surface Waters of Liverpool Bay,
W76-06740 5B

SALT MARSHES
Salinities of Ambient and Interstitial Waters of Some Massachusetts North Shore Salt-Marshes,
W76-06158 5B

Nitrogen, Phosphorus and Carbon Flux in Chesapeake Bay Marshes,
W76-06162 5C

SALT TOLERANCE
Seed Germination, Respiration and Mitochondrial Efficiency of Three Alfalfa (Medicago Sativa L.) Cultivars Subjected to NACL Salinity,
W76-06264 3C

SALTS
Disposal of Soluble Inorganic Salts,
W76-06156 5D

The Influence of High Salt Concentrations on Various Physiologic Paramters of Maize Roots, (In German),
W76-06790 3C

SAMPLING
Bulk Density Sampler for Deep Soil Profiles,
W76-06171 7B

National Eutrophication Survey Methods for Lakes Sampled in 1972.
W76-06221 5C

Evaluation of Mill Tailings Disposal Practices and Potential Dam Stability Problems in Southwestern United States. Investigation Report, Kennecott Copper Corporation, Chino Leaching Dump, Santa Rita, New Mexico, Volume 4,
W76-06671 8E

A Piston Corer for Peat,
W76-06724 5A

The Technique of Removing Large Undisturbed Samples of Lake Sediment: An Improved Bore Plumb, (In German),
W76-06776 2J

SAN ANTONIO (TX)
Regional Waste Water Development Plan: Analysis of Existing Facilities.
W76-06351 5D

SAN JUAN MOUNTAINS (COLO)
Development of Methodology for Evaluation and Prediction of Avalanche Hazard in the San Juan Mountain Area of Southwestern Colorado,
W76-06605 2C

SAND COLUMN MODEL
Drainage Rates from a Vertical Column,
W76-06165 2F

SAND TANK MODELS
Modeling Techniques for Groundwater Evaluation,
W76-06413 2F

SANDSTONES
Weathering and Hydrogeology of the Brumunddal Sandstone, Southern Norway,
W76-06676 2F

SANITARY ENGINEERING
Developer's Plans Detail Trash Collection System.
W76-06225 5E

SANTA RITA (NM)
Evaluation of Mill Tailings Disposal Practices and Potential Dam Stability Problems in Southwestern United States. Investigation Report, Kennecott Copper Corporation, Chino Leaching Dump, Santa Rita, New Mexico, Volume 4,
W76-06671 8E

SARGASSO SEA
Vertical Structure of Currents and Deep Temperatures in the Western Sargasso Sea,
W76-06690 2L

SATELLITES (ARTIFICIAL)
Remote Sensing of Resources in Arid Lands,
W76-06260 7A

Data Collection Systems and Their Impact on the Future Development of Hydrology,
W76-06277 7A

Determination of Snow Depth and Snow Extent from NOAA 2 Satellite Very High Resolution Radiometer Data,
W76-06383 2C

SATURATED SOILS
Influence of Waterlogging on Microbial Mineral Weathering, (In French),
W76-06730 5C

SCALING
Operating Data of a Vertical Plane Surface, Falling Film Evaporator Using Slurry and High Concentration Feeds,
W76-06250 3A

Method for Collecting Scale Formations in Water Pipes,
W76-06479 8G

SCHEDULING
Application of Multi-Regional Planning Models to the Scheduling of Large-Scale Water Resource Systems Development,
W76-06425 6A

SCIOTO RIVER (OHIO)
Loess in Ohio in Relation to Several Possible Source Areas: I. Physical and Chemical Properties,
W76-06399 2J

Loess in Ohio in Relation to Several Possible Source Areas: II. Elemental and Mineralogical Composition,
W76-06400 2J

SEA WALLS
Fry V. Kaiser (Rights of Owners of Recorded Plats Abutting Channel as Compared to Those of Subdivision Developer).
W76-06546 6E

SEA WATER
Biodeterioration of Navy Insecticides in the Ocean,
W76-06219 5B

A Photochemical Side Reaction That Interferes with the Phenolhypochlorite Assay for Ammonia,
W76-06712 5A

Activity Coefficients of Bicarbonates and Carbonates in Seawater,
W76-06720 5C

Apparatus for the in Situ Concentration of Trace Metals from Seawater,
W76-06721 5A

SEASHORES
Dolphin Lane Ass., Ltd. V. Southampton (Location of Shoreline Property Boundary by Customary Method of Verbal Formulation).
W76-06534 6E

SEASONAL
Seasonal Variation of Algal Biomass Production Potential and Nutrient Limitation in Yaquina Bay, Oregon,
W76-06702 5C

SECCHI DISKS
On the Universality of the Poole and Atkins Secchi Disk-Light Extinction Equation,
W76-06737 5A

SEDIMENT LOAD
The Bed-Load Function,
W76-06683 2J

SEDIMENT RESERVOIRS
Sediment Reservoirs in the Channels of Small Mountain Rivers,
W76-06177 2J

SEDIMENT TRANSPORT
Erosion and Sediment Transport in the Owens River Near Bishop, California,
W76-06458 2J

The Bed-Load Function,
W76-06683 2J

SEDIMENT YIELD
Influence of Vesicular Horizons on Watershed Management,

The Importance of the Effect of the Chemical Composition of Water on the Population of Snails: Intermediate Hosts of Schistosomes in Egypt,
W76-06763 5C

SNOW
Maximum Water Equivalents of Snow in the Northwestern Regions of the European USSR,
W76-06172 2C

Experiment in Applying Correlation Analysis to the Description of the Temporal Variations of Snow Melting Intensity in the Don River Basin,
W76-06173 2C

Determination of the Dates of Snow Disappearance in the Forest,
W76-06174 2C

Snow Avalanche Hazard in the United States: A Research Assessment.
W76-06195 2C

Flood of June 1971 Fort Nelson and Muskwa Rivers,
W76-06367 2E

Determination of Snow Depth and Snow Extent from NOAA 2 Satellite Very High Resolution Radiometer Data,
W76-06383 2C

SNOW

A Method for Estimating Snowfall Amounts, W76-06408 2C

Snow Water Equivalent Surveys of the Souris River Basin, W76-06665 2C

SNOW COVER
Determination of Snow Depth and Snow Extent from NOAA 2 Satellite Very High Resolution Radiometer Data, W76-06383 2C

Seasonal Streamflow Estimation Employing Satellite Snowcover Observations, W76-06638 4A

SNOW DEPTH
Determination of Snow Depth and Snow Extent from NOAA 2 Satellite Very High Resolution Radiometer Data, W76-06383 2C

SNOW MANAGEMENT
Snow Avalanche Hazard in the United States: A Research Assessment. W76-06195 2C

SNOW SURVEYS
Development of Snow Water Equivalent Survey Methods Using Airborne Gamma Measurements, W76-06659 2C

Snow Water Equivalent Surveys of the Souris River Basin, W76-06665 2C

SNOW WATER EQUIVALENT SURVEYS
Snow Water Equivalent Surveys of the Souris River Basin, W76-06665 2C

SNOWFALL
A Method for Estimating Snowfall Amounts, W76-06408 2C

SNOWFALL INDEX
A Method for Estimating Snowfall Amounts, W76-06408 2C

SNOWMELT
Experiment in Applying Correlation Analysis to the Description of the Temporal Variations of Snow Melting Intensity in the Don River Basin, W76-06173 2C

Formation of Water and Sediment Discharge During the Spring Flood on a Slope and in a Small Gully-Ravine Drainage Basin, W76-06176 2J

Flood Plain Information: Upper St. Vrain Creek, Volume IV, Boulder County, Colorado. W76-06357 4A

Method for Computing Evaporation During the Snow Melting and Flood Period in the Central Chernozem Regions of the European USSR, W76-06407 2D

Ecological Effects of Weather Modification: Effect of Late Snowmelt on Festuca Idahoensis Elmer Meadows, W76-06756 3B

SOCIAL IMPACT
An Assessment of the Expected Impact of a Dredging Project Proposed for Pala Lagoon, American Samoa, W76-06654 6G

SOCIAL NEEDS
Cognitive Strawman: Public Input to a Water Resource Planning System, W76-06548 6B

SOCIAL PARTICIPATION
Water Plan Ranking and the Public Interest, W76-06438 6B

SOCIAL VALUES
Cognitive Strawman: Public Input to a Water Resource Planning System, W76-06548 6B

SOIL ANALYSIS
Effect of Phosphorus and Sulphursphates on Movement of Phosphorus and Sulphur in Two Soils, W76-06242 2G

Cadmium and Zinc Contents of Corn Leaf and Grain Produced by Sludge-Amended Soil, W76-06304 5A

Significance of Trace Metals and Nitrates in Sludge Soils, W76-06307 5E

SOIL CHEMICAL PROPERTIES
Characteristics and Classification of Two Soils in Diyala Basin, Iraq, W76-06580 2G

Surface Runoff and its Effect on Diffuse Salt Production From Mancos Shale Members, W76-06583 2G

SOIL CHEMISTRY
Subarctic Plant Communities and Associated Litter and Soil Profiles in the Caribou Creek Research Watershed, Interior Alaska, W76-06194 4D

SOIL CLASSIFICATION
Characteristics and Classification of Two Soils in Diyala Basin, Iraq, W76-06580 2G

SOIL COMPACTION
Recovery from Soil Compaction on Bluegrass Range in the Black Hills, W76-06362 4D

Recovery from Soil Compaction on Bluegrass Lange in the Black Hills, W76-06405 2G

SOIL CONTAMINATION
The Role and Function of Verdure in Protecting the Human Environment. W76-06240 4C

SOIL CONTAMINATION EFFECTS
Effect of Phosphorus and Sulphursphates on Movement of Phosphorus and Sulphur in Two Soils, W76-06242 2G

SOIL DENSITY
Water Content and Bulk Density Changes in a Soil Pedon Measured with Dual Energy Gamma-Ray Transmission, W76-06238 5G

Studies on the Effect of Soil Density, Temperature and Fertilization of the Soil Moisture, Value Obtained with a Dielectric Measuring Technique, (In German), W76-06727 2G

SOIL DENSITY PROBES
Water Content and Bulk Density Changes in a Soil Pedon Measured with Dual Energy Gamma-Ray Transmission, W76-06238 5G

SOIL DEPTH
Characterizing the Soil Moisture Dynamics of Loess-Braunstaughley Soils in the Leoss Loam Hilly Tract of Northwest Saxony, (In German), W76-06726 2G

SOIL EROSION
Soil Erosion and Sedimentation in Tanzania and Lesotho, W76-06593 4D

Identification and Treatment of Dispersive Clay Soils, W76-06611 8D

SOIL FORMATION
Characteristics and Classification of Two Soils in Diyala Basin, Iraq, W76-06580 2G

SOIL HORIZONS
Thick BH Horizons in the North Carolina Coastal Plain: I. Morphology and Relation to Texture and Soil Ground Water, W76-06402 2G

Thick BH Horizons in the North Carolina Coastal Plain: II: Physical and Chemical Properties and Rates of Organic Additions from Surface Sources, W76-06403 2G

Influence of Vesicular Horizons on Watershed Management, W76-06596 4D

SOIL MOISTURE
Coal Mine Spoil as a Growing Medium: Amax Belle Ayr South Mine, Gillette, Wyoming, W76-06364 5G

Soil Moisture Regime of Unsaturated Zone in Some Arid Regions, W76-06578 2G

Correlation of Dual-Channel Airborne IR Data with Soil Moisture Measurements, W76-06660 2G

Soil Moisture Survey Experiment at Phoenix, Arizona, Date of Survey: March 18, 1975, W76-06664 2G

Characterizing the Soil Moisture Dynamics of Loess-Braunstaughley Soils in the Leoss Loam Hilly Tract of Northwest Saxony, (In German), W76-06726 2G

Studies on the Effect of Soil Density, Temperature and Fertilization of the Soil Moisture, Value Obtained with a Dielectric Measuring Technique, (In German), W76-06727 2G

Effects of Soil Moisture on Growth of Japanese Rabdosia, (In Japanese), W76-06771 2I

SOIL MOISTURE SURVEY
Soil Moisture Survey Experiment at Luverne Minnesota, Date of Survey: May 12, 1975, W76-06663 2G

Soil Moisture Survey Experiment at Phoenix, Arizona, Date of Survey: March 18, 1975, W76-06664 2G

SOIL PHYSICAL PROPERTIES
Effect of Sewage Sludge on Some Soil Physical Properties,
W76-06331 5E

Recovery from Soil Compaction on Bluegrass Range in the Black Hills,
W76-06362 4D

Pore Water Pressure Measuring Device,
W76-06477 2G

Characteristics and Classification of Two Soils in Diyala Basin, Iraq,
W76-06580 2G

SOIL PROFILES
Bulk Density Sampler for Deep Soil Profiles,
W76-06171 7B

Nitrate Movement and its Distribution in the Soil Profile of Differentially Fertilized Corn Watersheds,
W76-06401 5B

SOIL STABILIZATION
Soil Stabilization for Erosion Control,
W76-06639 4D

SOIL SURFACES
Influence of Vesicular Horizons on Watershed Management,
W76-06596 4D

SOIL TEMPERATURE
Correlation of Dual-Channel Airborne IR Data with Soil Moisture Measurements,
W76-06660 2G

Studies on the Effect of Soil Density, Temperature and Fertilization of the Soil Moisture, Value Obtained with a Dielectric Measuring Technique, (In German),
W76-06727 2G

SOIL TREATMENT
Water Harvesting: State of the Art,
W76-06584 3B

SOIL TYPES
Infiltration of Organic Phosphate Compounds in Soil,
W76-06170 5B

SOIL WATER
Water Content and Bulk Density Changes in a Soil Pedon Measured with Dual Energy Gamma-Ray Transmission,
W76-06238 5G

Soil Water Potential and Plant Behavior: A Case Modeling Study with Sunflowers,
W76-06461 2G

SOIL WATER MOVEMENT
The Growth of Disturbances in Unstable Infiltration Flows,
W76-06398 2G

Nitrate Movement and its Distribution in the Soil Profile of Differentially Fertilized Corn Watersheds,
W76-06401 5B

A Comparison of the Green-Ampt and Philip Two-Term Infiltration Equations,
W76-06404 2G

Investigation of Some Physical Properties of the Soils in the Dalmaj Pilot Project Area,
W76-06579 2G

SOIL-WATER-PLANT RELATIONSHIPS
Water Relations of Selected Species of Chaparral and Coastal Sage Communities,
W76-06259 3B

Salinity-Ozone Interactive Effects on Alfalfa Yield and Water Relations,
W76-06269 3C

Soil Moisture Regime of Unsaturated Zone in Some Arid Regions,
W76-06578 2G

Characteristics and Classification of Two Soils in Diyala Basin, Iraq,
W76-06580 2G

SOILS
Bulk Density Sampler for Deep Soil Profiles,
W76-06171 7B

Meltwater Losses Through Infiltration into Podzolic Soils and Chernozems,
W76-06181 2G

Orientation of Soil Stripes Caused by Needle Ice,
W76-06187 2C

Phosphate Sorption Characteristics of Soils Treated with Domestic Waste Water,
W76-06330 5B

Correlation of Dual-Channel Airborne IR Data with Soil Moisture Measurements,
W76-06660 2G

Influence of Waterlogging on Microbial Mineral Weathering, (In French),
W76-06730 5C

SOLAR ENERGY
Solar Energy Technology, State of the Art, An Annotated Bibliography,
W76-06565 3A

SOLID WASTES
Philadelphia's Solid Wastes Strategy Stresses Private Sector Participation,
W76-06199 5E

Efficient In-House Handling of Solid Waste,
W76-06224 5E

Developer's Plans Detail Trash Collection System.
W76-06225 5E

Development of an Economic/Environmental Plan for Dents Run Watershed, West Virginia.
W76-06270 5G

Hydrological and Hydrogeological Assessment of Landfill Sites,
W76-06315 5E

SOLUBILITY
Aqueous Solubility of Petroleum as Applied to its Origin and Primary Migration,
W76-06455 4B

SORPTION
Phosphate Sorption Characteristics of Soils Treated with Domestic Waste Water,
W76-06330 5B

SOURIS RIVER BASIN (N DAK-CAN)
Snow Water Equivalent Surveys of the Souris River Basin,
W76-06665 2C

SOUTH AMERICA
A Cost Analysis System for Ports,
W76-06631 6A

SOUTH DAKOTA
The Black Hills (South Dakota) Flood of June 1972: Impacts and Implications,
W76-06360 2E

Recovery from Soil Compaction on Bluegrass Range in the Black Hills,
W76-06362 4D

Recovery from Soil Compaction on Bluegrass Lange in the Black Hills,
W76-06405 2G

Cloud Seeding to Enhance Summer Rainfall in the Northern Plains,
W76-06612 3B

SOUTH RIVER WATERSHED (MASS)
The Effect of Land Use on The Chemical and Physical Quality of Surface and Ground Waters in Small Water Sheds,
W76-06552 5B

SOUTHERN COASTAL PLAIN
Computing Phreatic Groundwater Storage,
W76-06409 2F

SOUTHERN INDIAN LAKE
The Phytoplankton and Primary Productivity of Southern Indian Lake (Manitoba), A High Latitude, Riverine Lake,
W76-06204 5C

SOYBEANS
Chemical Composition and Yield of Soybeans as Affected by Irrigation and Deep Placement of Lime, Phosphorus and Potassium,
W76-06338 3C

SPATIAL DISTRIBUTION
The Distributional Ecology and Diversity of Benthic Insects in Cement Creek, Colorado,
W76-06587 2I

SPAWNING
The Effect of Water Temperature of the Incubation Time of a Pituitary Injection in Carp (Cyprinus Carpio L.) Under Field Conditions, (In German),
W76-06787 5C

SPECIES DIVERSITY
Multivariate and Sequential Statistical Procedures in the Biological Assessment of Water Quality,
W76-06561 5A

SPECIFIC ION ELECTRODE
Semi-Automated Ammonia Probe Determination of Kjeldahl Nitrogen in Freshwaters,
W76-06391 5A

SPECTROMETRY
The Use of Chitosan Columns for the Removal of Mercury from Waters,
W76-06239 5A

SPECTROPHOTOMETRY
Nitrosophenol and Nitrosonaphthol Derivatives as Reagents for Spectrophotometric Determination of Iron and Determination of Micro-Amounts in Waters with 2-Nitroso-5-Dimethylaminophenol,
W76-06303 5A

SPILLWAYS
Controlling Reservoir Trap Efficiency,
W76-06682 8B

SPODIC HORIZONS
Thick BH Horizons in the North Carolina Coastal Plain: II: Physical and Chemical Pro-

SPODIC HORIZONS
perties and Rates of Organic Additions from Surface Sources,
W76-06403 2G

SPODOSOLS
Thick BH Horizons in the North Carolina Coastal Plain: I. Morphology and Relation to Texture and Soil Ground Water,
W76-06402 2G

SPOKANE RIVER SYSTEM (WASH)
Application of Algal Assays to Define the Effects of Wastewater Effluents upon Algal Growth in Multiple use River Systems,
W76-06699 5C

SPORT FISHING
An Economic Analysis of Georgia's Marine Charter Boat Fishing Industry,
W76-06624 6C

SPRING FLOOD RUNOFF
Role of Bogs in the Formation of Spring Flood Runoff Losses in the Drainage Basins of the Northwestern European USSR,
W76-06175 4A

SPRINKLER IRRIGATION
Seedbed Soil Salinity and Emergence of Peppers and Carrots Under Sprinkler and Furrow Irrigation,
W76-06305 3C

Anti-Run Ahead System for Traveling Hose Pull Sprinklers,
W76-06465 3F

Sprinkler Control,
W76-06466 3F

Low Drift Spray Nozzle,
W76-06467 5G

ST. LAWRENCE RIVER
Penetration of the Deep Layer of the Saguenay Fjord by Surface Waters of the St. Lawrence Estuary,
W76-06674 2L

Degree of Pollution of the Saint Lawrence River from Repentigny to Montmagny, (In French),
W76-06734 5B

Degree of Pollution of the Saint Lawrence River from Repentigny to Montmagny: II. Biochemical Pollution, (In French),
W76-06735 5B

ST. LUCIE RIVER (FA)
Flood Plain Information: North Fork St. Lucie River, St. Lucie County, Florida.
W76-06282 4A

STANDARDS
An Approach to a Water Quality Index for Canada,
W76-06272 5G

EPA Standards: Health or Headache,
W76-06489 5G

Soap and Detergent Manufacturing Category (Pretreatment Standards for Incompatible Pollutants).
W76-06517 5G

STANDING CROPS
A Temperature-Stressed Stream Ecosystem Below a Hypolimnial Release Mountain Reservoir,
W76-06743 5C

STATE GOVERNMENT
Proceedings of Conference on 'Perspectives on Formulating State Water Policy'.
W76-06160 6E

STATE GOVERNMENTS
The Common Law of Public Nuisance in State Environmental Litigation,
W76-06488 6E

Water Quality Standards--Colorado River System (Salinity Control Policy and Standards Procedure).
W76-06512 5G

Interim Primary Drinking Water Standards.
W76-06522 5G

STATE POLICY
Environmental Impact Statements/Environmental Policy Act--Legislative Intent,
W76-06558 6G

STATISTICAL ANALYSIS
Statistical Design of Equalization Basins,
W76-06297 5D

STATISTICAL METHODS
On a Stochastic Model to Estimate Tsunami Risk,
W76-06189 2L

Method for Determination of Design Storms with Locally Nonuniform Distribution (Verfahren Zur Ermittlung Eines 'Berechnungsregens' Mit Ortlich Ungleichmaessiger Verteilung),
W76-06299 2A

Distribution Functions Limited at the Origin (Im Ursprung Begrenzte Verteilungsfunktionen),
W76-06316 2A

A Method for Estimating Snowfall Amounts,
W76-06408 2C

Multivariate and Sequential Statistical Procedures in the Biological Assessment of Water Quality,
W76-06561 5A

STILL RIVER (CN)
Flood Plain Information: Still and Mad Rivers, Town of Winchester, Connecticut.
W76-06284 4A

STOCHASTIC PROCESSES
On a Stochastic Model to Estimate Tsunami Risk,
W76-06189 2L

Release Control Policy for a Large Lake Subject to Wind Waves,
W76-06421 4A

STORAGE
Computing Phreatic Groundwater Storage,
W76-06409 2F

STORAGE CAPACITY
Controlling Pollution from Combined Sewers,
W76-06328 5D

STORAGE COEFFICIENT
Groundwater Resources of Altun-Kupri Area,
W76-06576 4B

STORM RUNOFF
Management of an Effective Maintenance Program,
W76-06333 5G

A Model to Predict the Performance of Feedlot Runoff Control Facilities at Specific Oregon Locations,
W76-06382 5B

STORM WATER
Method for Determination of Design Storms with Locally Nonuniform Distribution (Verfahren Zur Ermittlung Eines 'Berechnungsregens' Mit Ortlich Ungleichmaessiger Verteilung),
W76-06299 2A

Automatic Organic Monitoring System for Storm and Combined Sewers,
W76-06651 5A

STRAIN MEASUREMENT
Measurement of Small Strain-Rates Over Short Time Periods,
W76-06184 2C

STRATIFICATION
The Salinity Effect in a Mixed Layer Ocean Model,
W76-06393 2L

Continuous Cultures Applied to Ecological Research, (In French),
W76-06782 5C

STRAWMAN PROJECT
Cognitive Strawman: Public Input to a Water Resource Planning System,
W76-06548 6B

STREAM WATER QUALITY
Regional Distribution of the Major Dissolved Solids in the Streams of Illinois,
W76-06163 5B

STREAMBEDS
Depositional Models and the Shinarump Member and the Sonsela Sandstone Bed of the Chinle Formation Northeastern Arizona and Northwestern New Mexico,
W76-06258 2J

STREAMFLOW
Measurement of the Structure of River Flow,
W76-06180 2E

Water Resources Data for Georgia, Water Year 1975,
W76-06451 7C

A Generalized Streamflow Simulation System, Conceptual Modeling for Digital Computers,
W76-06634 2A

Method for Reducing Single Discharge Measurements to the Average Discharge of the Low-Flow Period,
W76-06679 2E

STREAMFLOW FORECASTING
Seasonal Streamflow Estimation Employing Satellite Snowcover Observations,
W76-06638 4A

STREAMFLOW SIMULATION
A Generalized Streamflow Simulation System, Conceptual Modeling for Digital Computers,
W76-06634 2A

STREAMS
Algae from Montane Streams on the Island of Mahe, in the Seychelles,
W76-06205 5C

Physical and Climatic Characteristics Along Kansas Streams,
W76-06450 7C

Arnett V Commonwealth Department of Highways (Liability for Damages to Crops Caused by Diversion of Water Resulting from Bridge Construction).
W76-06539 6E

STRENGTH OF MATERIALS
The Bearing Capacity of Floating Ice Plates Subjected to Static or Quasi-Static Loads, A Critical Survey,
W76-06192 8G

STRIP MINES
Using Wastewater Solids to Reclaim Strip-Mined Land,
W76-06287 5G

Coal Mine Spoil as a Growing Medium: Amax Belle Ayr South Mine, Gillette, Wyoming,
W76-06364 5G

SUBMERGED ORIFICES
Wastewater Disposal by Submerged Manifolds,
W76-06387 5B

SUBMERGENCE
Saltcedar (Tamarix Chinensis) Seed Production, Seedling Establishment, and Response to Inundation,
W76-06590 3B

SUCCESSION
Secondary Succession Following Extended Inundation of Texas Coastal Rangeland,
W76-06267 4A

Dynamics of Marsh Land Formation and Succession Along the Lower Colorado River and Their Importance and Management Problems as Related to Wildlife in the Arid Southwest,
W76-06589 4A

SUGARCANE
Effect of Saline Water Irrigation on N.Co310 and H50-7209 Cultivars of Sugarcane: II. Chemical Composition of Plants,
W76-06274 3C

SUITS IN ADMIRALTY ACT
Pollution--Right of Shipowner to Contribution from United States Where Negligence of Coast Guard was a Cause of Casualty and Ensuing Spill. Burgess V. The Tamano, 373 F Supp 839 (D ME 1974),
W76-06493 5G

SULFIDES
Determination of Parts Per Billion Sulfide in Water with the Sulfide-Selective Electrode,
W76-06744 5A

SULFUR
Nitrogen and Sulfur Content and pH of Precipitation in Iowa,
W76-06208 5C

SULFUR BACTERIA
Effect of Salinization on Certain Soil Microflora,
W76-06582 5C

SULFURIC ACID
Process for the Treatment of Waste Waters Containing Sulfuric Acid and/or Ammonium Sulfate,
W76-06470 5D

SUNFLOWERS
Soil Water Potential and Plant Behavior: A Case Modeling Study with Sunflowers,
W76-06461 2G

SUPERCOOLING
Thermodynamic Properties of Bulk and Occluded Super-Cooled Water and Ionic Solutions,
W76-06155 1A

SURFACE-GROUNDWATER RELATIONSHIPS
A Combined Model of Water Table and River Stage Evolution,
W76-06380 2A

Systematic Design of Legal Regulations for Optimal Surface -Groundwater Usage - Phase 2,
W76-06551 4B

SURFACE RUNOFF
More Water for Arizona.
W76-06261 3B

Surface Runoff and its Effect on Diffuse Salt Production From Mancos Shale Members,
W76-06583 2G

Managing Chaparral for Water and Other Resources in Arizona,
W76-06597 3B

Vegetation Management for Water and Range Improvement,
W76-06598 3B

SURFACE WATERS
Natural Isotopes in Surface and Groundwater from Argentina,
W76-06185 2F

Surface Water Data, Reference Index, Canada 1975.
W76-06377 7C

Water Resources of the Thrust Belt of Western Wyoming,
W76-06448 7C

Water Resources Data for Georgia, Water Year 1975,
W76-06451 7C

Hydrologic Evaluation of Salinity Control and Reclamation Projects in the Indus Plain, Pakistan--A Summary,
W76-06453 5G

A Socio-Economic Evaluation of Alternative Water Management Policies on the Rio Grande in New Mexico,
W76-06644 6B

Penetration of the Deep Layer of the Saguenay Fjord by Surface Waters of the St. Lawrence Estuary,
W76-06674 2L

SURVEYS
National Eutrophication Survey Methods for Lakes Sampled in 1972.
W76-06221 5C

Surface Water Data, Reference Index, Canada 1975.
W76-06377 7C

Inventory of Florida Coastal Zone Planning Publications: Volume I, Coastal Counties and Cities.
W76-06566 2L

Inventory of Florida Coastal Zone Planning Publications: Volume II, Multi-County Planning Districts.
W76-06567 2L

Inventory of Florida Coastal Zone Planning Publications: Volume III, Statewide.
W76-06568 2L

Development of Snow Water Equivalent Survey Methods Using Airborne Gamma Measurements,
W76-06659 2C

Soil Moisture Survey Experiment at Luverne Minnesota, Date of Survey: May 12, 1975,
W76-06663 2G

Soil Moisture Survey Experiment at Phoenix, Arizona, Date of Survey: March 18, 1975,
W76-06664 2G

SUSPENDED SOLIDS
Sediment Reservoirs in the Channels of Small Mountain Rivers,
W76-06177 2J

Upgrading Primary Treatment with Chemicals and Water Treatment Sludge,
W76-06286 5D

An Investigation of Suspended Material Concentrations in Eastern Long Island Sound,
W76-06381 2L

SUSQUEHANNA RIVER BASIN
Summary and Conclusions: Nutrient Transport and Accountability in the Lower Susquehanna River Basin,
W76-06575 5B

SWEDEN (LAKE TAMNAREN)
Vegetation in Lake Tamnaren: Interpretation of Aerial Photos and Description of the Vegetation, (In Swedish),
W76-06781 2H

SWITZERLAND (LAKE OF ZURICH)
The Effect of Bacterial Substances on the Growth of Two Cladophoraciae in Pure Culture, (In German),
W76-06779 5C

SWITZERLAND RIVER THUR
Limnological and Morphological Relationships Between Water and River Bed in the Lower Course of the Thur River, (In German),
W76-06736 2E

SYNTHETIC CLEANSING AGENTS
Oregon Synthetic Cleansing Agent Act,
W76-06502 6E

SYNTHETIC HYDROLOGY
Synthesis of Basin Response with Inadequate Data,
W76-06675 2A

SYSTEMATICS
Algae from Montane Streams on the Island of Mahe, in the Seychelles,
W76-06205 5C

Aquatic Insects of Wisconsin,
W76-06215 5C

Taxonomy of Klebsiella pneumoniae Isolated from Pulp/Paper Mill Wastewater,
W76-06645 5C

SYSTEMS ANALYSIS
Uncertainties in Karstic Water Resources Systems,
W76-06595 2F

SYSTEMS ENGINEERING
Long-Term Operation of Storage Hydro Projects,
W76-06434 4A

TAILINGS
Mine and Mill Wastewater Treatment.
W76-06373 5D

Evaluation of Mill Tailings Disposal Practices and Potential Dam Stability Problems in Southwestern United States, Investigation Report, Phelps Dodge Corporation, Morenci Tailings Dam, Morenci, Arizona, Volume 2,
W76-06669 5G

Evaluation of Mill Tailings Disposal Practices and Potential Dam Stability Problems in Southwestern United States. Investigation Report, Kennecott Copper Corporation, Magna Tailings Dam, Magna, Utah. Volume 3,
W76-06670 5G

TAMARISK
Saltcedar (Tamarix Chinensis) Seed Production, Seedling Establishment, and Response to Inundation,
W76-06590 3B

TAX RATES
Corrective Taxes for Pollution Control: An Application of the Environmental Pricing and Standards Systems to Agriculture,
W76-06618 5G

TECHNOLOGY
Planning Water Resources Research Programs,
W76-06440 6B

Applications of Aerospace Technology in the Public Interest: Pollution Measurement,
W76-06710 5C

TELEDETECTION
Teledetection by Airplane and Satellite in the Study of Marine Pollution, (In French),
W76-06717 5A

TEMPERATURE
Temperature and Salinity Structure in the Weddell Sea,
W76-06394 2L

Aqueous Solubility of Petroleum as Applied to its Origin and Primary Migration,
W76-06455 4B

Observations of Currents and Temperatures in the Southeast Florida Coastal Zone During 1971-72,
W76-06656 2L

Vertical Structure of Currents and Deep Temperatures in the Western Sargasso Sea,
W76-06690 2L

Empirical Functions Relating Metabolic Processes in Aquatic Systems to Environmental Variables,
W76-06755 5C

TEMPERATURE CONTROL
Review of Heated Discharge Management and Control Alternatives, Once-Through Systems in Large Water Bodies.
W76-06372 5B

TEMPORAL DISTRIBUTION
Experiment in Applying Correlation Analysis to the Description of the Temporal Variations of Snow Melting Intensity in the Don River Basin,
W76-06173 2C

TERRAIN ANALYSIS
Trend Surface Analysis of Powder River Basin, Wyoming - Montana,
W76-06363 4A

TERTIARY TREATMENT
Technology and $20 Billion Advance Wastewater Treatment Effort.
W76-06271 5D

TEST WELLS
Fibonacci Search for High-Yield Well Sites,
W76-06686 4B

TETRAZOLIUM TEST
Localization of Damage Incurred During Water Imbibition by Pisum Sativum and Zea Mays Seeds, as Revealed by the Topographic Tetrazolium Test,
W76-06649 2I

TEXAS
Regional Waste Water Development Plan: Analysis of Existing Facilities.
W76-06351 5D

THARTHAR LAKE (IRAQ)
A Proposal for Future Utilization of Tharthar Lake Water,
W76-06577 3C

THEORETICAL ANALYSIS
Tidal Theory and Computations,
W76-06414 2L

THERMAL CAPACITY
Thermodynamic Properties of Bulk and Occluded Super-Cooled Water and Ionic Solutions,
W76-06155 1A

THERMAL CONDUCTIVITY
Geothermal Power System and Method,
W76-06472 3E

THERMAL PLUME
Field Studies of the Thermal Plume from the D. C. Cook Submerged Discharge with Comparisons to Hydraulic-Model Results,
W76-06673 5B

THERMAL POLLUTION
Review of Heated Discharge Management and Control Alternatives, Once-Through Systems in Large Water Bodies.
W76-06372 5B

Submerged Multiport Diffusers for Cooling Water Discharge,
W76-06464 5D

Method for Determining and Controlling Liquid Cooling System Characteristics.
W76-06484 5G

Field Studies of the Thermal Plume from the D. C. Cook Submerged Discharge with Comparisons to Hydraulic-Model Results,
W76-06673 5B

THERMAL POWERPLANTS
Review of Heated Discharge Management and Control Alternatives, Once-Through Systems in Large Water Bodies.
W76-06372 5B

THERMAL SPRINGS
Hot Springs of Rhodesia: Their Noble Gases, Isotopic and Chemical Composition,
W76-06190 2K

Associations of Blue-Green Algae of Thermal Springs of Stravropol and Krasnodar Krais and Georgian SSR, (In Russian),
W76-06769 5C

THERMAL STRESS
Evaporative Cooling of 'Delicious' Apples: The Economic Feasibility of Reducing Environmental Heat Stress,
W76-06791 3F

THERMAL WATER
Bibliography of Studies on the Density and Other Volumetric Properties for Major Components in Geothermal Waters, 1928-1974,
W76-06454 4B

Geothermal Power System and Method,
W76-06472 3E

THERMODYNAMIC BEHAVIOR
Thermodynamic Properties of Bulk and Occluded Super-Cooled Water and Ionic Solutions,
W76-06155 1A

THERMODYNAMICS
Thermodynamic Limitations on the Use of the Platinum Electrode in Eh Measurements,
W76-06738 5A

THERMOPHILIC BACTERIA
Thermophilic Microbiological Treatment of High Strength Wastewaters with Simultaneous Recovery of Single Cell Protein,
W76-06293 5D

THRUST BELT (WESTERN WYO)
Water Resources of the Thrust Belt of Western Wyoming,
W76-06448 7C

TIDAL EQUATIONS
Tidal Theory and Computations,
W76-06414 2L

TIDAL MARSHES
Accumulation Rate and Turnover Time of Organic Carbon in a Salt Marsh Sediment,
W76-06714 5C

TIDAL MOTIONS
Observations of Currents and Temperatures in the Southeast Florida Coastal Zone During 1971-72,
W76-06656 2L

TIDAL WATERS
Flood Plain Information: Coastal Areas, Sarasota County, Florida.
W76-06285 4A

Advances in Hydroscience, Volume 10-1975.
W76-06412 8B

Tidal Theory and Computations,
W76-06414 2L

TIDAL WAVES
Flood Plain Information: Coastal Areas, St. Lucie County, Florida.
W76-06354 4A

TIDES
Advances in Hydroscience, Volume 10-1975.
W76-06412 8B

Tidal Theory and Computations,
W76-06414 2L

TIME SERIES ANALYSIS
Applications of Linear Time Series Models and Stepwise Regression Models to Selected Water Quality Data on the Connecticut River,
W76-06157 5B

Distribution Functions Limited at the Origin (Im Ursprung Begrenzte Verteilungsfunktionen),
W76-06316 2A

Fortran Graphics Programs for Physical Oceanographic and Time Series Data,
W76-06661 7C

TISZA RIVER VALLEY (HUNGARY)
Case Study: For the Analysis of Water Management Investments on Hand of the Example of the Kiskore River Barrage and Its Irrigation Systems,
W76-06427 4A

TOMATOES
Irrigation of Field Tomatoes and Measurement of Soil Water Changes by Neutron Moderation Methods,
W76-06793 3F

TOPOCK MARSH
Dynamics of Marsh Land Formation and Succession Along the Lower Colorado River and Their Importance and Management Problems as Related to Wildlife in the Arid Southwest,
W76-06589 4A

TOPOGRAPHY
Precipitation in Valleys,
W76-06693 2B

TOTAL ORGANIC CARBON
Automatic Organic Monitoring System for Storm and Combined Sewers,
W76-06651 5A

TOXICITY
Revegetating Bituminous Strip-Mine Spoils with Municipal Wastewater, Part II: Quality the Leacheate and Spoil Chemical Changes,
W76-06343 5D

TRACE ELEMENTS
Significance of Trace Metals and Nitrates in Sludge Soils,
W76-06307 5E

Trace Element Concentrations of Sewage Treatment Plant Effluents and Sludges; Their Interactions with Soils and Uptake by Plants,
W76-06332 5B

Apparatus for the in Situ Concentration of Trace Metals from Seawater,
W76-06721 5A

Neutron Activation Analysis of Some of the Biologically Active Trace Elements in Fish,
W76-06753 5A

TRACERS
Use of Silver and Zinc to Trace Sewage Sludge Dispersal in Coastal Waters,
W76-06655 5B

TRACKING TECHNIQUES
Natural Isotopes in Surface and Groundwater from Argentina,
W76-06185 2F

TRANSMISSIVITY
Groundwater Resources of Altun-Kupri Area,
W76-06576 4B

TRANSMISSOMETER
Transmissometer Measurements of the Great Lakes,
W76-06370 7B

TRANSPIRATION
Effects of Water Stress on Leaf Respiration, Transpiration Rates in the Dark and Cuticular Resistance to Water Vapor Diffusion of Two Corn Inbreds,
W76-06266 2D

TRANSPORTATION
Costs in Relation to Charges at UK Common-User Berths,
W76-06234 6C

TRAP EFFICIENCY
Controlling Reservoir Trap Efficiency,
W76-06682 8B

TREATMENT
Monograph for the Effectiveness and Cost of Water Treatment Processes for the Removal of Specific Contaminats, Volume II, KWIK Index,
W76-06350 5F

TREATMENT FACILITIES
Pioneering in Water Filtration,
W76-06278 5F

Government-Contractor-Engineer Liason that Creates an Economical Project,
W76-06319 5F

Dealing with the Discharge Monitoring Report,
W76-06325 5G

Health Significance of Airborne Microorganisms from Wastewater Treatment Processes, Part I: Summary of Investigations,
W76-06326 5C

Health Significance of Airborne Microorganisms from Waste Water Treatment Processes, Part II: Health Significance and Alternatives for Action,
W76-06327 5C

How to Improve Plant Efficiency,
W76-06342 5G

Evaluation of In-Line and Side-Line Flow Equalization Systems,
W76-06348 5D

Regional Waste Water Development Plan: Analysis of Existing Facilities.
W76-06351 5D

Sewer and Water Facilities in the Northern Middlesex Area, Short Range Priority Program 1972-1977.
W76-06353 5G

Soap and Detergent Manufacturing Category (Pretreatment Standards for Incompatible Pollutants).
W76-06517 5G

YBBARPSAN-A Small Receptacle for a Large Industry: Water Conservation Action in the Vicinity of Perstorp AB, (In Swedish),
W76-06732 5D

TROPHIC LEVEL
The Relationships of Phosphorus and Nitrogen to the Trophic State of Northeast and North-Central Lakes and Reservoirs.
W76-06220 5C

Nutrient Assessments as a Basis for Lake Management Priorities,
W76-06704 5C

Development of Oxygen Deficits in 14 Southern Ontario Lakes,
W76-06715 5C

Polyspecies Aquaculture Systems: The Detrital Trophic Level,
W76-06759 5C

TRUCKEE RIVER (CAL)
Transient Water Quality Modeling in Streams,
W76-06433 5B

TSUNAMIS
On a Stochastic Model to Estimate Tsunami Risk,
W76-06189 2L

Flood Plain and Tsunami Inundation Area Ordinance.
W76-06492 6F

TUBEWELLS
Hydrologic Evaluation of Salinity Control and Reclamation Projects in the Indus Plain, Pakistan--A Summary,
W76-06453 5G

TURBULENCE
Measurement of the Structure of River Flow,
W76-06180 2E

TURGIDITY
Water Relations of Selected Species of Chaparral and Coastal Sage Communities,
W76-06259 3B

ULTRAVIOLET RADIATION
The Winter Distribution of Ultra-Violet Absorption in the Surface Waters off the West Coast of the British Isles,
W76-06739 5B

Seasonal Distribution of Ultraviolet Absorption in the Surface Waters of Liverpool Bay,
W76-06740 5B

UNDERDEVELOPED COUNTRIES
Economic Benefits of Potable Water Supplies in Rural Areas of Developing Countries,
W76-06230 6B

UNDERWATER PIPELINE
Wave Forces on Bottom-Mounted Large-Diameter Cylinder,
W76-06395 8B

UNITED NATIONS
Japan and the United Nations Conference on the Law of the Sea,
W76-06491 6E

UNITED NATIONS CONFERENCE ON THE LAW OF THE SEA
Japan and the United Nations Conference on the Law of the Sea,
W76-06491 6E

UNITED STATES
Pollution--Right of Shipowner to Contribution from United States Where Negligence of Coast Guard was a Cause of Casualty and Ensuing Spill. Burgess V. The Tamano, 373 F Supp 839 (D ME 1974),
W76-06493 5G

Nat. Res. Def. Council V. Train. (Federal Water Pollution Act Amendments).
W76-06523 6E

UNSATURATED FLOW
The Growth of Disturbances in Unstable Infiltration Flows,
W76-06398 2G

UNSTABLE FLOW
The Growth of Disturbances in Unstable Infiltration Flows,
W76-06398 2G

UPWELLING
Upwelling Along the Yarmouth Shore of Nova Scotia,
W76-06688 2L

The Dynamic Structure of the Frontal Zone in the Coastal Upwelling Region Off Oregon,
W76-06695 2L

URANIUM ORE MILLS
Correlation of Radioactive Waste Treatment Costs and the Environmental Impact of Waste Effluents in the Nuclear Fuel Cycle for Use in Establishing 'As Low as Practicable' Guides--Appendix A. Preparation of Cost Estimates for Volume 1, Milling of Uranium Ores,
W76-06614 5D

URBAN AREAS
Urban Effects on the Distribution of Heavy Convective Rainfall,
W76-06680 4C

URBAN DRAINAGE
Environmental Management for the Metropolitan Area Cedar-Green River Basins, Washington, Part II: Urban Drainage.
W76-06573 6G

Kaneoche Alternatives: An Application of Impact Methodology.
W76-06574 6G

URBAN HYDROLOGY
Reorientation of Urban Water Resources Research, Final Report,
W76-06553 6B

Reorientation of Urban Water Resources Research, Executive Summary,
W76-06554 6B

URBAN-RELATED WATER RESOURCES RESEARCH
Reorientation of Urban Water Resources Research, Final Report,
W76-06553 6B

Reorientation of Urban Water Resources Research, Executive Summary,
W76-06554 6B

URBANIZATION
Reorientation of Urban Water Resources Research, Final Report,
W76-06553 6B

Reorientation of Urban Water Resources Research, Executive Summary,
W76-06554 6B

Urban Effects on the Distribution of Heavy Convective Rainfall,
W76-06680 4C

US GEOLOGICAL SURVEY REPORTS (WYO)
Geologic and Water-Supply Reports and Maps--Wyoming, July 1975,
W76-06456 10C

USE RATES
Lake Location and Quality as Determinants of Potential Recreation Benefits: A Study of Selected Lakes in Manitoba,
W76-06622 6B

USSR
Maximum Water Equivalents of Snow in the Northwestern Regions of the European USSR,
W76-06172 2C

Experiment in Applying Correlation Analysis to the Description of the Temporal Variations of Snow Melting Intensity in the Don River Basin,
W76-06173 2C

Determination of the Dates of Snow Disappearance in the Forest,
W76-06174 2C

Role of Bogs in the Formation of Spring Flood Runoff Losses in the Drainage Basins of the Northwestern European USSR,
W76-06175 4A

Formation of Water and Sediment Discharge During the Spring Flood on a Slope and in a Small Gully-Ravine Drainage Basin,
W76-06176 2J

Some Characteristics of the Process of Incomplete Meandering of the Channel of the Upper OB' River,
W76-06178 4A

Level of Closed Bodies of Water as One of the Criteria of Global Water Exchange,
W76-06179 2A

Meltwater Losses Through Infiltration into Podzolic Soils and Chernozems,
W76-06181 2G

Production of Planktonic Crustaceans of Two Secondary Oligotrophic Lakes, (In Russian),
W76-06301 5C

Method for Computing Evaporation During the Snow Melting and Flood Period in the Central Chernozem Regions of the European USSR,
W76-06407 2D

The Effect of Forest on Minimum River Runoff in the Broad-Leaved Forest Zone and Forest-Steppe of the European Part of the USSR, (In Russian),
W76-06783 4C

USSR (GEORGIAN SSR)
Associations of Blue-Green Algae of Thermal Springs of Stravropol and Krasnodar Krais and Georgian SSR, (In Russian),
W76-06769 5C

USSR (LAKE KRASNOE)
Chlorophyll a Content as an Index of Periphyton Productivity, Exemplified by Lake Krasnoe, (In Russian),
W76-06772 5A

USSR (LATVIA)
Study of the Strontium 90/Strontium Isotope Balance in a Latvian Lake, (In Russian),
W76-06733 5A

USSR (MINGECHAUR RESERVOIR)
Horizontal Distribution of Zooplankton in the Mingechaur Reservoir, (In Russian),
W76-06780 2H

USZWICA RIVER (POLAND)
Annual Development of Plankton in a River Water Intake Weir and in a Treatment Pond and its Removal in Treatment Plants,
W76-06211 5C

UTAH
The Efficient Use of Utah's Irrigation Water: Increased Transferability of Water Rights,
W76-06487 3F

Utah Water Quality Standards,
W76-06503 5G

Child V Spanish Fork (Transference of Irrigation Water as Precedent to Annexation).
W76-06535 6E

Evaluation of Mill Tailings Disposal Practices and Potential Dam Stability Problems in Southwestern United States. Investigation Report, Kennecott Copper Corporation, Magna Tailings Dam, Magna, Utah. Volume 3,

Water Quality Model for Small Agricultural Watershed,
W76-06641 5B

WEST VIRGINIA UNIV., MORGANTOWN. DEPT. OF BIOLOGY.
A Comparative Study of Chemical Loadings of Acid and Non-Acid Tributaries of Cheat Lake, West Virginia,
W76-06213 5B

WESTERN AUSTRALIA UNIV., NEDLANDS. DEPT. OF PHYSICS.
The Interpretation of the Crystalline and Air Bubble Structures of Hail Stones,
W76-06167 2B

WESTERN POTATO SERVICE, INC., GRAND FORKS, N. DAK.
Infrared Dry Caustic Vs. Wet Caustic Peeling of White Potatoes,
W76-06652 5D

WESTERN SCIENTIFIC SERVICES, INC., FORT COLLINS, COLO.
Development of an Experimental Hydrometeorological Data Collection Network,
W76-06606 2B

WHITMAN AND HOWARD, INC., BOSTON, MASS.
Pioneering in Water Filtration,
W76-06278 5F

WISCONSIN UNIV. EXTENSION, MADISON.
A Guide to Wisconsin's Lake Management Law.
W76-06632 6E

WISCONSIN UNIV. EXTENSION, MADISON. ENVIRONMENTAL RESOURCES UNIT.
Identification and Management of Eurasian Water Milfoil in Wisconsin,
W76-06725 5C

WISCONSIN UNIV., GREEN BAY. COLL. OF ENVIRONMENTAL SCIENCE.
Flood Damage Reduction Potential of River Forecast,
W76-06435 6F

WISCONSIN UNIV., GREEN BAY. COLL. OF ENVIRONMENTAL SCIENCES.
Vegetation Changes in a Small Michigan Bog from 1917 to 1972,
W76-06761 2H

WISCONSIN UNIV., MADISON. DEPT. OF ENTOMOLOGY.
Aquatic Insects of Wisconsin,
W76-06215 5C

WISCONSIN UNIV., MADISON. ENVIRONMENTAL RESOURCES EXTENSION.
The Impact of Overwinter Drawdown on the Aquatic Vegetation of the Chippewa Flowage, Wisconsin,
W76-06711 4A

WISCONSIN UNIV., MADISON INST. FOR ENVIRONMENTAL STUDIES.
The Green Bay Watershed - Past/Present/Future,
W76-06569 5C

WISCONSIN UNIV., MADISON. WATER CHEMISTRY LAB.
Phosphorus Sources for the Lower Madison Lakes,
W76-06718 5B

WISCONSIN UNIV., MADISON. WATER RESOURCES CENTER.
Nutrient Assessments as a Basis for Lake Management Priorities,
W76-06704 5C

WISCONSIN UNIV., PARKSIDE, DEPT. OF EARTH SCIENCE.
Wisconsin Recreational Harbor Facilities Along Lake Michigan,
W76-06628 6B

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MASS.
A Piston Corer for Peat,
W76-06724 5A

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MASS. DEPT. OF BIOLOGY.
Nutrient Transformations in Mass Cultures of Marine Algae,
W76-06441 5C

Polyspecies Aquaculture Systems: The Detrital Trophic Level,
W76-06759 5C

WORLD METEOROLOGICAL ORGANIZATION, GENEVA. (SWITZERLAND).
Drought and Agriculture,
W76-06265 2B

WORLD METEOROLOGICAL ORGANIZATION, GENEVA (SWITZERLAND). WORKING GROUP ON HYDROLOGICAL FORECASTING.
Hydrological Forecasting Practices.
W76-06633 2A

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 9, NUMBER 14
JULY 15, 1976

The Library of the
AUG 9 1976
University of
at Urbana-Champ

W76-06801 -- W76-07450
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates are: SWRA Journal only, $75 ($95 foreign); Journal and Annual Indexes, $100 ($125 foreign); Indexes only, $50 ($65 foreign).

Some documents abstracted in this journal can be purchased from NTIS at prices shown in the entry; prices subject to change. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

LIBRARY U. S. GEOLOGICAL SURVEY

VOLUME 9, NUMBER 14
JULY 15, 1976

W76-06801 -- W76-07450

he Secretary of the U.S. Department of the Interior has determined that the publication of this periodical is necessary in the ansaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

USE OF PERTURBED GAMMA-GAMMA DIRECTIONAL CORRELATIONS IN THE STUDY OF ANOMALOUS WATER STRUCTURE,
North Dakota State Univ., Fargo. Dept. of Physics.
J. C. Glass, and G. Graf.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-252 190, $3.50 in paper copy, $2.25 in microfiche. North Dakota Water Resources Research Institute, Fargo, Completion Report No. WI-222-008-75, July, 1975, 11 p, 13 ref. OWRT-B-010-NDAK(1). 14-31-001-3318.

Descriptors: *Spectroscopy, *Water Structure, Water properties, Molecular structure, Hydrogen bonding, Colloids, Protein, Analytical techniques.
Identifiers: *Nuclear Spectroscopy, *Anomalous water, Perturbed directional correlations.

Perturbed gamma-gamma directional correlation is a branch of nuclear spectroscopy. When two gamma rays from a radioactive nucleus are emitted in a cascade their directional correlation can be perturbed by the interaction of the nucleus with extranuclear fields. Very small tracer concentrations (10-12M) are usually quite sufficient to probe the internal structure of the medium. By using Ba-133 ions the structure of water associated with the globular protein carbonic anhydrase was investigated. Water at the protein interface is highly ordered resembling ice in its properties. A study by this technique of water droplets condensed in capillaries showed that the abnormally high viscosity of the sample is not the result of covalent bonding but rather originates from exceptionally strong hydrogen bonding. The internal fields and symmetry characteristics of the active region andactive site carbonic anhydrase were also investigated by using Co-57 tracer.

2A. General

COMPARISON OF THE GEORGIA TECH, KANSAS, KENTUCKY, STANFORD AND TVA WATERSHED MODELS IN GEORGIA,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
A. M. Lumb.
Georgia Environmental Resources Center, Atlanta, Report ERC-0476, January 1976, 137 p, 11 fig, 17 tab, 52 ref, 2 append. OWRT A-047-GA(2) 14-31-0001-4010.

Descriptors: Hydrology, *Simulation analysis, Rainfall-runoff relationships, *Georgia, *Streamflow, Soil moisture, Infiltration, Evapotranspiration, Interflow, Surface runoff, Baseflow, Subsurface flow, Hydrologic data, *Computer models, Flood forecasting, Low-flow simulation, Water yield, Water supply, *Model studies, Watersheds(Basins), *Optimization.
Identifiers: *Watershed models, Parameter optimization.

Watershed models programmed for continuous simulation were compared. The Georgia Tech, Kansas, Kentucky, Standford and TVA Watershed Models were calibrated on a mountain, a piedmont and a coastal plain watershed in Georgia. Eight years were simulated and only the first four years were used for calibration. Plots of daily streamflow hydrographs and correlation coefficients were used for comparison. Methods to compute surface runoff in each model were adequate. Accuracies of the data bases were not sufficient for a more refined comparison. Slightly lower correlation coefficients suggest the Kansas and TVA models may not simulate surface runoff quite as well though the daily time step of the TVA model may be more a factor than the method of computing the surface runoff. Interflow concepts of the Standord Watershed Model which relate to the first soil zone were judged better than the Kansas and Georgia Tech models which relate inter-flow to the second soil zone. Baseflow was simulated poorly with the TVA model because the objective function for parameter optimization was not appropriate. Baseflow was simulated poorly with the Kentucky model because the optimization method was inadequate. Baseflow on all models could be improved slightly by using the groundwater evapotranspiration parameter. Two seasonal parameters in the Kentucky Watershed Model were not found necessary and caused a misrepresentation of the lower zone for Camp Creek. Problems were encountered when providing actual evapotranspiration instead of potential evapotranspiration as input to the TVA model. Little or no deterioration in accuracy of streamflow predictions resulted from extrapolating to periods longer than the calibration period.

SOME GENERAL PRECIPITATION-RIVER FLOW RELATIONSHIPS IN ENGLAND AND WALES,
Bristol Univ. (England). Dept. of Geography.
M. G. Anderson.
Weather, Vol. 30, No. 11, p 368-371, November 1975. 3 fig, 1 tab, 9 ref.

Descriptors: *Precipitation(Atmospheric), *Runoff, *Rainfall-runoff relationships, Fourier analysis, Watersheds(Basins), Streamflow, Rivers, Spatial distribution, Surface waters, Hydrology.
Identifiers: *England, *Wales.

The purpose of this brief paper is to analyze for a limited number of stations in England and Wales both the timing of maximum precipitation and the timing of maximum riverflow and to attempt an interpretation of the resulting spatial patterns. Harmonic analysis was used with the records from 19 watersheds to derive the spatial pattern of time of maximum annual precipitation and the pattern of maximum river flow. These patterns were combined to obtain the pattern of lag time between the maximum precipitation and maximum discharge. The results of the analyses of phase lag between precipitation and river flow series at the annual frequency by harmonic analysis confirmed the strong spatial pattern in such lags. Such patterns are accounted for by broad geological and evapotranspiration differences. (Sims - ISWS)

AN ANALYSIS OF FOUR SHOWERS WITH RAINFALL RATES > 250 MM/HR,
Hawaii Univ., Honolulu. Dept. of Meteorology.
C. M. Fullerton, and S. K. Wilson.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-252 191, $4.50 in paper copy, $2.25 in microfiche. Hawaii Water Resources Research Center, Honolulu, Technical Report No. 90, UHMET 75-03, June 1975. 45 p, 22 fig, 5 tab, 14 ref, append. B-032-HI OWRT(1). 14-31-0001-5011

Descriptors: *Cloud physics, *Rainfall intensity, Atmospheric pressure, Dew point, Meteorological data, Wind velocity, Networks, *Precipitation(Atmospheric), Monitoring.
Identifiers: *Raymond-Wilson rainfall intensity gauge, Showers, Cloud rain showers.

A computer monitored network of rapid-response Raymond-Wilson rainfall intensity gauges is operating at the Cloud Physics Observatory (CPO), on the windward coast of the island of Hawaii, recording the passage of both warm and cold cloud rain showers. During a one-year (1 July 1973 to 30 June 1974) monitoring period, 57 rainfall events were recorded with intensities plus or minus 95 mm/hr. Four of these events exhibited rainfall rates plus or minus 250 mm/hr. Each of these events is analyzed as a case study documenting the network rainfall intensity records, the associated local variations in potential gradient, surface wind velocity and atmospheric pressure, rawinsonde soundings of temperature, dew point and winds, satellite and 250-mb wind data, and an isohyetal presentation of the accumulated rainfall over the island. Of the four cases studied, three were clearly of cold cloud origin, two being synoptic-scale events associated with low pressure centers west of Hawaii and the third a highly localized thunderstorm related to an upper level trough. The most interesting case was a 268 mm/hr rainfall intensity event almost certainly of warm cloud origin. This case (22 June 1974) may represent a record high rainfall rate from clouds known to lie entirely beneath the freezing level. Finally, a comparison is made of the winds aloft with a calculated disturbance velocity indicating, in most cases, that the surface wind gust occurring just before the onset of rainfall is approximately equal to the wind vector at cloud level. Two anomalous cases are discussed briefly.
W76-06907

POTENTIAL USE OF RADAR DIFFERENTIAL REFLECTIVITY MEASUREMENTS AT ORTHOGONAL POLARIZATIONS FOR MEASURING PRECIPITATION,
Ohio State Univ., Columbus. Atmospheric Sciences Program; and Ohio State Univ., Columbus. Dept. of Electrical Engineering.

LIBRARY U. S. GEOLOGICAL SURVEY

Field 2—WATER CYCLE

Group 2B—Precipitation

T. A. Seliga, and V. N. Bringi.
Journal of Applied Meteorology, Vol. 15, No. 1, p 69-76, January 1976. 7 fig, 27 ref.

Descriptors: *Remote sensing, *Radar, *Precipitation(Atmospheric), Rainfall, Drops(Fluids), Raindrops, Precipitation intensity, Rainfall intensity, Measurement, Analytical techniques, Cloud physics, Meteorology.
Identifiers: *Drop-size distributions.

The potential use of differential reflectivity measurements at orthogonal polarizations to determine rainfall rate was examined. The method involves measurements of Z sub H and Z sub V, the radar reflectivity factors due to horizontally and vertically polarized incident waves respectively. The differential reflectivity, Z sub DR=10 log (Zsub H/Z sub V), which should be precisely determinate, occurs as a result of the distortion of raindrops as they fall at terminal velocity. The approximate theory of Gans for electromagnetic scattering by spheroids was applied to the distorted raindrops. Assuming a general exponential form for the raindrop size distribution, equations were derived relating the distribution parameters to the measurements. The determination of rainfall rate followed directly. Finally, the sensitivity of the distribution parameters to radar inaccuracies was examined, and several methods of implementing the measurements were suggested. It was concluded that good estimates of rainfall rate using a single non-attenuating wavelength radar are possible under ideal conditions. (Sims - ISWS)

Descriptors: *Hail, *Snow, *Precipitation intensity, Rates, Measurement, Precipitation(Atmospheric), Ice, Melt water, Meteorology.

Normally, the total water-equivalent amount or water-equivalent precipitation rate is used to characterize all documented precipitation. For all types of rainfall, and even some snowfall, this information translates easily to the interested party. But water-equivalent precipitation rates of other solid hydrometeors, like soft hail, hail, or snowflakes, are not well known. Often the contribution by hailfall alone to the total water amount is masked during a precipitation episode of rain plus hail. This brief note described a few measurements of water-equivalent precipitation rates for some solid hydrometeor types (soft hail, hail and snowflakes). Precipitation rates for the solid hydrometeors were measured by exposing an open, high-walled pan to the precipitation for a measured time interval. After the precipitation episode had ended, the contents of the pan were emptied into a plastic bag; the net mass of solid hydrometeors was then determined by weighing the bag and then emptying, drying and reweighing the bag on a laboratory balance to an accuracy of + or -0.01 g. Exposure times varied from 15-30 min, depending on the visual constancy of the precipitation or its duration. Precipitation rates measured in this manner are really mass fluxes: mass per unit area per unit time. Since the net mass of the accumulated solid hydrometeors remains constant even if it is melted, a simple conversion to the equivalent depth of melted water can be made. Two examples of hailfall consisting of stones of slightly larger than 1 cm diameter (with no accompanying rain) give nearly identical precipitation rates of just over 15 mm/hr. (Sims - ISWS)

SOME REMARKS ON MODELING OF THE EARLY STAGES OF CLOUD FORMATION IN A SIMULATION CHAMBER,
Missouri Univ., Rolla, Graduate Center for Cloud Physics Research.
A. N. Saad, J. Podzimek, and J. C. Carstens.
Journal of Applied Meteorology, Vol. 15, No. 2, p 145-156, February 1976. 16 fig, 3 tab, 29 ref, 1 append. NSF GA-36041, ONR N00014-69-A-0141-0005.

Descriptors: *Cloud physics, *Model studies, *Nucleation, Clouds, Raindrops, Drops(Fluids), Particle size, Cloud seeding, Mathematical models, Meteorology.
Identifiers: *Cloud chambers, Cloud simulation.

A numerical model has been developed to describe the early stage of cloud formation in a relatively small simulation chamber. The result for adiabatic expansion showed a tendency for the cloud droplet spectrum to narrow, similar to the results obtained by other authors. The influence of updraft fluctuations was not as important as the fluctuation of temperature which depends upon the amplitude and frequency of the fluctuations, and the expansion rate of volume. Simple models of the sedimentation of the drops showed that sedimentation might be a factor limiting the rate of expansion. Nuclei suddenly introduced into the cloud parcel indicated that the seeding effect depends significantly on the concentration and size of predominantly larger nuclei. (Sims - ISWS)

METEOROLOGICAL INTERPRETATIONS OF THE IMAGES FROM THE NIMBUS 5 ELECTRICALLY SCANNED MICROWAVE RADIOMETER,
National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
T. T. Wilheit, J. S. Theon, W. E. Shenk, L. J. Allison, and E. B. Rodgers.
Journal of Applied Meteorology, Vol. 15, No. 2, p 166-172, February 1976. 14 fig, 9 ref.

Descriptors: *Remote sensing, *Rainfall disposition, *Clouds, *Oceans, Rainfall, Weather, Weather data, Weather patterns, Instrumentation, Satellites(Artificial), Microwaves, Radiation, Meteorology.
Identifiers: *Electrically Scanning Microwave Radiometer, Nimbus, Radiometers.

The Electrically Scanned Microwave Radiometer (ESMR) on the Nimbus 5 satellite measures the microwave radiation emitted by the earth and the atmosphere in a wavelength band centered at 1.55 cm. At these wavelengths, the emissivity of the earth and atmosphere varies considerably more than at infrared wavelengths. Thus the contrast in radiance between land surfaces, which have high emissivities, and ocean surfaces, which have low emissivities, makes continents and islands readily distinguishable. There is a minimum of interference from clouds since most non-raining clouds are virtually transparent at these wavelengths. However, atmospheric moisture does modify the radiation emitted by the surface and when cloud droplets reach precipitable size, they enhance the radiation considerably over surfaces of low emissivity (e.g., over oceans), making it possible to map areas of rainfall as well as regions of heavy cloudiness. In this application the ESMR images are meteorologically useful in determining the extent, structure and, qualitatively, the intensity of rainfall. It is then possible, over oceans, to determine the location of frontal rain, rain/snow boundaries, and the structure of tropical storms. Because of the generally high emissivities of land surfaces and the wide range of values they assume, interpretation of atmospheric parameters over land is not possible at present. (Sims - ISWS)

AN OBJECTIVE RAINFALL INTERPOLATION AND MAPPING TECHNIQUE,
British Meteorological Office, Bracknell (England).
R. J. Shearman, and P. M. Salter.
Hydrological Sciences Bulletin, Vol. 20, No. 3, p 353-363, September 1975. 4 fig, 3 tab, 9 ref.

Descriptors: *Rainfall disposition, Rainfall, *Areal, *Isohyets, *Distribution patterns, Mathematical studies, Rain gages, Depth-area curves, Contours, Mapping, Weather data, Hydrologic data, Average, Meteorology.
Identifiers: *United Kingdom, *Rainfall interpolation, Lowland catchments, Highland catchments.

A scheme was described for the interpolation of rainfall data from the United Kingdom rainfall station network to a regular 5 km grid. The effects of topography were indirectly allowed for by using a background field of average annual rainfall. A cubic spline technique was used in the computer program to produce isohyetal and isopercentile maps. Areal rainfall was calculated by using the arithmetic mean of rainfall values at the intersections of the 5-km grid. Examples of computer produced maps and computed areal rainfalls were discussed. The objective rainfall interpolation and mapping techniques were demonstrated to be useful for relatively quick analysis of rainfall data in both operational and research functions. Areal rainfall routines produce acceptable results for areas larger than 200 sq km. Grids smaller than the 5-km grid are being developed to better represent the smaller scale features of the rainfall field. (Bender - ISWS)

CONTRIBUTION TO THE PROBLEM OF COMPUTING PRECIPITATION OVER MOUNTAIN DRAINAGE BASINS,
A. A. Grigor'yev.
Soviet Hydrology, Selected Papers, No. 5, p 329-333, 1974. 2 fig, 1 tab, 6 ref. Translated from Transactions of the Kazakh Hydrometeorological Scientific Research Institute (Trudy KazNIGMI), No. 5, p 100-106, 1974.

Descriptors: *Precipitation(Atmospheric), *Mountains, *Watersheds(Basins), Runoff, Rivers, Elevation, Orography, Rainfall, Data processing, Hydrology, Meteorology.
Identifiers: *USSR.

The conditions for computing precipitation in mountain drainage basins were analyzed using the basins of the Chu and Talass rivers and of lake Issyk-Kul, which lie in northern Kirghizia and partly in Southern Kazakhstan, as an example. It was found that if only observation points on the valley floor are used to compute precipitation in transverse valleys, the amount of precipitation will be too low in individual vertical zones and in the basin as a whole. Computations from a smoothed curve give results that are more comparable with the total amounts of precipitation obtained by the weighting method than computations from actual curves based on readings at observation points on the floor of the valleys. A significant advantage of computing precipitation from a smoothed curve over computing it from the actual curve is the more justified extrapolation of the curve in its upper part, corresponding to the high-mountain zone for which there are virtually no precipitation observations. This zone, which is most active in runoff formation, accounts for no less than 2/5 of the entire mountain area of the region under study. (Sims - ISWS)

Journal of Glaciology, Vol. 14, No. 72, p 375-382, 1975. 5 fig, 1 tab, 14 ref.

Descriptors: *Glaciers, *Melt water, *Drainage, Alpine, Ablation, Ice, Dye releases, Tracers, Rhodamine, Flow, Discharge(Water), Glaciology, Europe.
Identifiers: *Hintereisferner, *Austria.

Studies that had been started in 1971 were continued in the summer of 1972 in order to gather information on the intraglacial run-off system in the ablation region of Hintereisferner. In a long-term test of 30 h, the daily fluctuations of the inflow into a moulin and the discharge at the glacier mouth were measured. A number of injections of dye tracers were made to measure the curve of concentration versus time. Finally, a test was made to compare with last year's results, in which the inflow was marked with dye at three different points on the glacier. From the long-term measurements the daily fluctuations of the average velocity of flow in the intraglacial run-off system and the dispersion coefficient were determined. The results confirmed the previous experiments, showing that the melt water reaches the glacier bed taking the shortest possible route without passing through cavities within the glacier, flowing mostly in an open channel. (Sims - ISWS)

BOUDINAGE IN GLACIER ICE-SOME EXAMPLES,
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Geographisches Institut; and Eidgenoessische Technische Hochschule, Zurich (Switzerland). Geologisches Institut.
M. J. Hambrey, and A. G. Milnes.
Journal of Glaciology, Vol. 14, No. 72, p 383-393, 1975. 9 fig, 20 ref.

Descriptors: *Glaciers, *Geomorphology, *Ice, Flow, Strain, Glaciology, Europe.
Identifiers: *Boudinage, *Switzerland, Glacier flow, Foliation.

Boudinage structures have only rarely been reported in glacier ice, yet they seem to be widespread in Swiss glaciers. They form in debris-free, strongly foliated ice by the stretching, necking and rupture of layers or groups of layers, when the principal compressive strain axis lies at a high angle to the layering. Two main types of boudinage were distinguished. The first results from the differences in competence between fine-grained and coarse-grained ice, and indicates that the former is more resistant to flow than the latter. The second occurs in more equigranular ice which shows a strong planar anisotropy; associated with the necking of such ice is the development of shear planes, along which the layers are displaced. As in deformed rocks, it is not possible to determine the directions of the finite principal strain axes from the boudinage structures alone. Although the boudins described here all occur in longitudinal foliation, it was suggested that they are likely to form in other situations also. (Sims - ISWS)

THE DEBRIS CONTENT OF SURGING GLACIERS IN SVALBARD AND ICELAND,
Aberdeen Univ., (Scotland). Dept. of Geography.
C. M. Clapperton.
Journal of Glaciology, Vol. 14, No. 72, p 395-406, 1975. 5 fig, 1 tab, 30 ref.

Descriptors: *Glaciers, *Glacial sediments, *Glacial drift, Gravels, Sands, Till, Sediments, Ice, Surges, Fjords, Geomorphology, Glaciology.
Identifiers: *Surging glaciers, *Svalbard, *Iceland, Debris content.

In Svalbard and Iceland there appears to be much more debris entrained in glaciers that surge than in those which do not. Conditions particularly favorable for the basal incorporation of debris develop as a consequence of the high flow velocities attained by a surge. These are increased cavitation in the lee of obstacles and an increased supply of basal melt water resulting from frictional heat and from the trigger zone. Layers of regelation ice incorporating debris can thus develop to a much greater vertical and horizontal extent than in non-surging glaciers. Excessive shearing and the distortion of foliation structures in the terminal zone of compressive flow enhance the vertical development of the debris-rich regelation layers. Glaciers that surge over outwash and/or fjord-bottom sediments become particularly rich in debris. (Sims - ISWS)

A COMPARISON OF GLACIER MASS BALANCE BY GLACIOLOGICAL, HYDROLOGICAL AND MAPPING METHODS, SOUTH CASCADE GLACIER, WASHINGTON,
Geological Survey, Tacoma, Wash.
W. V. Tangborn, R. M. Krimmel, and M. F. Meier.
In: Snow and Ice; Proceedings of the Moscow Symposium, August 1971: International Association of Hydrological Sciences Publication No 104, p 185-196, 1975.

Descriptors: *Glaciers, *Mass transfer, *Washington, Analytical techniques, Mapping, Geology, Hydrology, Melt water, Water storage, Water loss, Glaciology.
Identifiers: *Glacier mass balance, *South Cascade(Wash).

Three different methods of determining glacier mass balance were compared on South Cascade Glacier, Washington, during the period 20 June to 10 September 1970. The mass loss measured on the glacier by the glaciological and mapping methods agrees within 2%. The mass loss for the drainage basin calculated by the hydrological method is 38% greater than the loss for the same area measured by the glaciological method. This discrepancy is probably due to the release of liquid water storage from the glacier in summer. These liquid storage changes may account for errors in attempts to measure the annual balance of glaciers by hydrological means. (Woodard-USGS)

GLACIOLOGY,
Geological Survey, Tacoma, Wash.
M. F. Meier.
Reprint from McGraw Hill Yearbook of Science and Technology, 1974, p 224-226, 1975. 2 fig, 2 ref.

Descriptors: *Glaciology, *Remote sensing, *Satellites(Artificial), *Glaciers, *Aerial photography, Data collections, Melt water, Movement, Glacial sediments, Scour.
Identifiers: *Surging glaciers, *ERTS images.

The launch of the first Earth resources technology satellite (ERTS-1) late in 1972 was soon followed by the use of images from the satellite to monitor glacier behavior in a way never before thought possible. Certain classes of glaciers may move so swiftly that valleys may be dammed and the resulting lakes released as devastating floods before the change in the glacier is noticed by mankind. These surging glaciers must be monitored at frequent time intervals. Surge-type glaciers can be distinguished from normal glaciers in high-resolution satellite images. ERTS images have proved to be invaluable in monitoring tidal glaciers in Alaska, such as the Hubbard Glacier, which is advancing and threatening to close off Russell Fjord near Yakutat, and the Columbia Glacier, which may retreat and cast increasing numbers of icebergs into Prince William Sound. In other ERTS images, sediment plumes from Alaskan coastal glaciers, extending more than 50 km into the Pacific Ocean, could be clearly identified. Although it was known that large amounts of sediments are carried to the sea from glaciers, the overall view provided by the satellite images is the first to show visually the extent. (Woodard-USGS)

2D. Evaporation and Transpiration

DISPOSITION OF WATER FROM FRUIT CROPS AND APPROACHES TO INCREASE WATER USE EFFICIENCY,
Florida Univ., Gainesville. Dept. of Fruit Crops.
J. F. Bartholic, D. W. Buchanan, T. Phung, and P. L. Ryan.
Florida Water Resources Research Center, Gainesville, Publication No. 33, February 1976. 99 p, 23 fig, 22 tab, 78 ref. OWRT B-014-FLA (6) 14-31-0001-3868.

Descriptors: *Water utilization, Evaporation pans, *Fruit crops, Evapotranspiration, Recharge, Irrigation, Evaporation, Mist irrigation, *Water loss, *Water balance, Citrus, *Water requirements, Soils, Crop production.
Identifiers: Drip irrigation.

Objectives were to evaluate water loss and needs for fruit crops and to find ways of improving water use efficiency. A year-long water balance study in a 9 acre peach orchard measured inflow of 142 cm, outflow of 55 cm and evapotranspiration (ET) of 91 cm. ET was 0.7 of pan evaporation during the summer and 0.3 in the fall with dormant vegetation. A water balance study for citrus showed a net contribution to the aquifer with present irrigation practices, but no contribution with 100% irrigation. Irrigation needs estimated from daily climatic records varied from 13 to 18 irrigations for a soil with 5 cm of available soil water storage capacity and from 3 to 6 with 10 cm of storage. Plant water stress (PWS) of the same scion (top of tree) on different rootstocks showed wide capabilities of rootstocks to take up soil water. Water sprayed intermittently on leaves reduced PWS and increased tree growth and yield. For 3 years trees with drip or overhead irrigation had no difference in growth, however drip irrigation used 2/3 less water and increased both yields and fruit size. (Morgan-Florida)

CALCULATION OF EVAPORATION RATES DURING THE TRANSITION FROM ENERGY-LIMITING TO SOIL-LIMITING PHASES USING ALBEDO DATA,
Agricultural Research Service; Phoenix, Ariz. Water Conservation Lab.
R. D. Jackson, S. B. Idso, and R. J. Reginato.

Water Resources Research, Vol. 12, No. 1, p 23-26, February 1976. 5 fig, 20 ref.

Descriptors: *Evaporation, *Energy transfer, *Soils, Albedo, Soil surfaces, Potential flow, Lysimeters.
Identifiers: Evaporation rates, Energy-limiting phase, Soil-limiting phase, Potential evaporation, Surface water content, Formulas, Priestly-Taylor formula.

A method was presented that utilizes albedo measurements to partition the fraction of the soil surface area exhibiting energy-limiting (potential) evaporation and the fraction exhibiting soil-limiting evaporation to calculate actual evaporation rates during the transition phase (energy limiting to soil limiting). Since albedo is proportional to the surface water content, the change in albedo from day to day was indicative of the fraction of the soil surface that was dry and evaporating at the soil-limiting rate. By denoting the partitioning factor as beta and by using a square root of time relation with a coefficient C for the soil-limiting phase the evaporation rate Ec for a day n after the soil was wet was expressed by a formula where Ep was the energy-limiting rate. The Priestly-Taylor formula was used to calculate Ep. Calculated evaporation rates were compared with lysimetrically determined rates. It was concluded that this method is reliable for calculating evaporation rates during the transition phase of soil drying. (Roberts - ISWS)

EVAPORATION DEFICIT UNDER VARIOUS CLIMATIC CONDITIONS ON LAND,
L. I. Zubenok.
Soviet Hydrology, Selected Papers, No. 4, p 251-257, 1974. 1 fig, 1 tab, 14 ref. Translated from Transactions of the Main Geophysical Observatory (Trudy GGO), Vol. 307, p 155-164, 1974.

Descriptors: *Evaporation, *Evapotranspiration, *Climatic zones, *Irrigation, Climatic data, Climates, Temperature, Solar radiation, Irrigation practices, Hydrologic budget, Climatology.
Identifiers: *Evaporation deficit, *Potential evapotranspiration.

The difference between evaporative power and total evaporation, i.e., the evaporation deficit, can be regarded as a water deficit and used as a criterion for the irrigation rate. The evaporation deficit can serve as an index of water availability for estimating not only mean annual but also short-period wetting conditions, making it possible to judge the water regime of plants in the course of the year. Information on the intra-annual variations in the evaporation deficit for the Soviet Union has been presented elsewhere. Here the annual pattern of the evaporation deficit under various climatic conditions on land was discussed. The monthly evaporative power and evaporation values needed to compute the evaporation deficit were determined by the methods proposed by M. I. Budyko. (Sims-ISWS)

LEAF WATER POTENTIAL RESPONSE TO TRANSPIRATION BY CITRUS,
Instituto Colombiano Agropecuario, Bogota.
S. E. Camacho-B, M. R. Kaufmann, and A. E. Hall.
Physiol Plant. 31(2), p 101-105, 1974.

Descriptors: *Citrus fruits, *Oranges, Model studies, *Water requirements, *Transpiration, *Leaves.
Identifiers: Citrus-Limonia, Citrus-Reshni, Citrus-Sinensis, Citrus-Spp, Poncirus-Trifoliata, Seedlings, Leaf water potential.

Further studies of a model for interpreting leaf water potential data for C. (sinensis) are reported. Experimental data confirmed the assumption that the ratio of vapor pressure deficit to leaf diffusion resistance adequately estimates transpiration when leaf-to-air temperature differences are small. Date collected diurnally indicated that the relationship between leaf water potential and transpiration followed a sequence of steady states without hysteresis. No difference in water transport characteristics was found for Valencia orange on 3 rootstocks in well-watered soil, but the 2 rootstocks Cleopatra mandarin (C. reshni) and Rangpur (C. limonia) gave slightly greater leaf water stress in Valencia orange leaves than Troyer citrange (C. sinensis X Poncirus trifoliata) rootstock at high transpiration rates under mild soil water deficits. In laboratory studies, previously unstressed seedlings had higher leaf water potentials than field trees at equivalent transpiration rates. After several drying cycles, leaf water potentials were similar to those observed in the field.--Copyright 1974, Biological Abstracts, Inc.

EFFECTS OF SILICONE ANTITRANSPIRANT ON WOODY PLANTS,
Wisconsin Univ., Madison. Dept. of Forestry.
K. J. Lee, and T. T. Kozlowski.
Plant Soil. 40(3): 493-510. Illus. 1974.

Descriptors: Trees, *Pine trees, *Transpiration, *Emulsions, *Chlorophyll, Water balance, *Antitranspirants, Toxicity, *Weather.
Identifiers: Acer-Saccharum, Fraxinus-Americana, Pinus-Resinosa, Pinus-Strobus, *Seedlings, *Silicone, *Woody plants.

Effects of Dow Corning silicone emulsion antitranspirant (XF-4-3561 Fluid) on transpiration of Fraxinus americana, Acer saccharum and Pinus residosa seedlings and on chlorophyll content and seedling mortality of these species and Pinus strobus were investigated. The effect of silicone on expansion of new (current year) needles of P. resinosa and P. strobus was also studied. Transpiration of Fraxinus seedlings treated with 1, 3, 5, 8, or 10% silicone was reduced for only 1 day. Five and 3% silicone reduced transpiration by about 79% and 49% in Acer. The effects of 5% silicone lasted at least 7 days and of 3% silicone for about 5 days. Five % silicone decreased transpirations of P. resinosa by 90% for more than 10 days in plants growing in wet or dry soil. Internal water balance of P. resinosa needles was improved 12 days after treatment with 5% silicone. Silicone emulsion at 50, 20 and 10% was toxic to all 4 species. Fifty % silicone killed all 4 species. Twenty % silicone killed Acer and P. resinosa seedlings, and caused shedding of whole leaves of Fraxinus. Ten % silicone induced brown spots (about 1 mm in diameter) on Fraxinus leaflets, browning at tips of Acer leaves, and a light green color at tips of new (current-year) needles of P. resinosa and P. Strobus. Elongation of new (current-year) needles of P. resinosa and P. strobus seedlings was significantly retarded by 20 and 10% silicone. The growth rate of new needles of P. strobus during the 2nd mo. after treatment with 10 or 20% silicone was higher than that of plants treated with 3 or 1% silicone or of control plants. Three % silicone also retarded growth of new needles of P. resinosa. Chlorophyll content 45 days after application of 20% or 10% silicone was reduced in all 4 species. Three percent silicone reduced chlorophyll content in P. resinosa and A. saccharum, but not in Fraxinus or P. strobus.--Copyright 1974, Biological Abstracts, Inc.

ESTIMATES OF EVAPOTRANSPIRATION RATES AT GUELPH, CANADA, BY PENMAN AND THORNTHWAITE METHODS,
Cape Coast Univ. (Ghana). Dept. of Physics.
A. N. De-Heer-Amissah.
Ghana J Sci. 13(2), p 124-133, 1973.

Descriptors: *Canada, *Evapotranspiration, Grasses, Methodology, Measurement, Regression analysis.
Identifiers: *Grass cover, Guelph, Penman method, Thornthwaite method.

Potential evapotranspiration rates over a grass cover have been estimated using Penman's and Thornthwaite's methods. The 2 methods give comparable estimates if annual totals are considered. Monthly totals differ from one another. From May to July Penman estimates are higher than Thornthwaite estimate but after July Thornthwaite estimates become higher. This observation is attributed to the fact that temperature which is the predominant term in the Thornthwaite expression lags behind radiation by about 6 wk. There is a high correlation between evapotranspiration energy (PEp) and net radiation (RN),(r=0.96). The ratio PEp/RN is about 0.75 from May to Nov for Guelph. This ratio however shows a seasonal variation being highest in July. It is suggested, on the basis of the high correlation between PEp and RN, that together with actual soil moisture measurements, values of RN may be used to make reasonable estimates of actual evapotranspiration rates. The regression equation for 1 station would not necessarily hold for another station which has a different climatic regime.--Copyright 1975, Biological Abstracts, Inc.

THE EFFECT OF WIND ON GRASSES: I. CUTICULAR AND STOMATAL TRANSPIRATION,
Edinburgh Univ. (Scotland). Dept. of Forestry and Natural Resources.
J. Grace.
J Exp Bot. 25(86), p 542-551, 1974.

Descriptors: *Transpiration, *Effects, *Grasses, *Winds, Measurement.
Identifiers: Dactylis-Glomerata, Festuca-Arundinacea, Festuca-Pratensis, Lolium-Perenne.

Transpiration of Festuca arundinacea Schreb, strain S170, was measured at 2 different wind speeds in a controlled-environment wind tunnel. As a result of a wind increase from 1 m s-1 to 3.5 m s-1 above the sward, transpiration gradually increased, especially at night-time. Similar effects were noted in 3 other grass species (F. pratense, Lolium perenne, Dactylis glomerata). The transpiration increase could be attributed to decreases in stomatal and cuticular resistances, as a result of leaf buffeting.--Copyright 1975, Biological Abstracts, Inc.

RECOGNITION AND PREDICTION OF RUNOFF-PRODUCING ZONES IN HUMID REGIONS,
Agricultural Research Service, Danville, Vt.
T. Dunne, T. R. Moore, and C. H. Taylor.
Hydrological Sciences Bulletin, Vol. 20, No. 3, p 305-327, September 1975. 16 fig, 56 ref.

Descriptors: *Humid areas, *Storm runoff, *Overland flow, *Subsurface runoff, *Infiltration, Humid climates, Runoff, Surface runoff, Subsurface flow, Zone of saturation, Topography, Vegetation, Soils, Soil profiles, Soil horizons, Return flow.
Identifiers: *Saturation overland flow, Saturated zone variation, Variable source area concept.

Field experiments on representative and experimental basins have demonstrated the validity of the variable-source concept of storm runoff production in humid regions. Storm runoff is produced on small portions of a catchment which vary in extent during and between storms. In order to make the variable-source concept useful for flood prediction, water quality management, and land planning, it is necessary to develop routine methods for recognizing and quantifying the seasonal and in-storm variation of the saturated runoff-producing zones. The paper suggested various hydrological, pedological and vegetative indicators of this variation. They can be used for prediction of the maximum seasonal extent of saturated conditions, and also for day-to-day accounting, probability studies, and for analyzing the probable effect of some environmental change. The techniques were illustrated with examples from representative and experimental basins in the United States and Canada. (Bender - ISWS)

FLOOD PLAINS OF THE SOUTH BRANCH SHIAWASSEE RIVER, LIVINGSTON COUNTY, MICHIGAN,
Geological Survey, Lansing, Mich.
L. E. Stoimenoff.
Open-file report 75-78, 1975. 3 fig, 6 plates, 5 ref.

Descriptors: *Flood plains, *Flood profiles, *Mapping, *Flood frequency, *Michigan, Hydrologic data, Streamflow, Flood data, Planning, Land development.
Identifiers: *South Branch Shiawassee River(Mich), Livingston County(Mich).

Results of a flood-plain study are presented for approximately 1.9 mi of the South Branch Shiawassee River in, Livingston County, Mich. This reach of stream is in a currently unicorporated area about 40 mi northwest of Detroit. Although little development has taken place, the potential for development is great due to urban spread from the Detroit Metropolitan area. To implement local flood-plain management plans, areas subject to flooding are defined. The flood plain is generally swamp or has a dense growth of brush. Much of the stream channel has been dredged and its alignment has been straightened to improve its water carrying capacity. The flood plain is broad throughout the study area. For the 100-year flood, the width of the flood plain generally exceeds 1,500 ft in the lower reaches; upstream the width of the flood plain narrows to about 500 ft. Beyond the limits of the mapped flood plain, the land surface remains relatively flat. These are subject to flooding from rarer floods. (Woodard-USGS)

FLOODS IN NEW YORK, 1972, WITH SPECIAL REFERENCE TO TROPICAL STORM AGNES,
Geological Survey, Albany, N. Y.
F. L. Robison.
Available from National Technical Information Service, Springfield, Va., 22161 as PB-251 116 $5.00 in paper copy, $2.25 in microfiche. Water-Resources Investigations 34-75, January 1976. 91 p, 23 fig, 2 tab, 43 ref.

Descriptors: *Floods, *Flood data, *Peak discharge, *Flood damage, *New York, Hydrologic data, Storms, Rainfall-runoff relationships, Streamflow, Stream gages, Historic floods.
Identifiers: *Tropical storm Agnes(NY).

Intense rainfall associated with Tropical Storm Agnes in late June resulted in the worst flood damage in the history of New York State. Flooding that began in Westchester County on June 19, 1972 was followed by widespread flooding in the Southern Tier and Finger Lakes regions on June 23. Maximum known peak discharges were measured at three major rivers in the State. The Allegheny River crested at the highest discharge of record on June 23 (73,000 cfs or 2,070 cu m/sec). The Chemung River at Chemung reached the highest discharge of record on June 24 (189,000 cfs or 5,350 cu m/sec). The Genessee River raised the water at Mount Morris Dam to the highest level of record (755.8 feet or 230.4 metres). Flooding associated with Tropical Storm Agnes caused 24 deaths and evacuation of 100,000 residents. Damage to private property in the State has been estimated at more than $400 million; to public property, $221 million; and to agriculture $84 million. (Woodard-USGS)

GROUNDWATER YEAR BOOK 1968-70.
Department of the Environment, London (England). Water Data Unit.
Her Majesty's Stationary Office, London (England), November 1975. 146 p, 18 fig, 2 tab, 2 maps.

Descriptors: *Groundwater, *Data collections, *Water levels, *Fluctuations, Observation wells, Sampling, Statistics, Rainfall, Evaporation, Soil moisture, Aquifers, Meteorological data, Information retrieval.
Identifiers: *England, *Wales.

The Groundwater Year Book provides data related to the fluctuations of groundwater levels in principal aquifers, together with meteorological information as it relates to changes in groundwater storage. Metric units are used throughout. This third edition contained information for 1664 observation wells in England and Wales, with samples of the water level statistics for the years 1968, 1969 and 1970. These statistics are now held on computer archive and are available from the Water Data Unit. Since the opportunity now exists for the rapid retrieval and analysis of data, a limited presentation of tabular and graphical output from the computer archive and a description of the retrieval service was provided. Details of rainfall, evaporation and soil moisture deficits in thirteen districts and comments on the weather in relation to groundwater levels were included. Groundwater level fluctuations during 1968 to 1970 in representative wells were described in relation to this meteorological data and to long-term groundwater statistics. (Robinson - ISWS)

A SEISMIC GROUND-WATER SURVEY IN NEW HAMPSHIRE,
New Hampshire Univ., Durham. Dept. of Earth Sciences.
F. S. Birch.
Ground Water, Vol. 14, No. 2, p 94-100, March-April 1976. 4 fig, 9 ref.

Descriptors: *Groundwater, *Hydrogeology, *Seismic studies, *New Hampshire, Surveys, Geology, Seismic properties, Groundwater basins, Groundwater potential, Aquifers, Aquifer characteristics, Water table, Magnetic studies, Bedrock, Topography.
Identifiers: *Barbadoes Pond(NH).

The drainage basin of Barbadoes Pond, Madbury and Dover, southeastern New Hampshire, was studied by seismic refraction and magnetic measurements as part of an interdisciplinary investigation. The purpose of the geophysical measurements was to provide boundary conditions (bedrock and water-table elevations) for a mathematical model of groundwater flow. The basin is intensively used for recreation, municipal water supply, and sand and gravel mining. Barbadoes Pond is a kettle lake lying in the middle of a broad, flat-topped sand and gravel hill (a 'kame plain'). The plain is surrounded by marine clay at a lower elevation. A broad, deep, northwest-southwest trending trough underlies the plain according to seismic refraction measurements (45 lines) and water wells. The present form and location of the trough are attributed to glacial enlargement of a stream valley eroded along a bedrock shear zone. The bedrock topography and seismic velocity are directly related to erosion resistance of the vertically dipping metasedimentary bedrock. Magnetic anomalies are consistent with the seismic results. Water-table elevation correlates with bedrock elevation, not surface elevation. This is a consequence of highly permeable sand and gravel, the principal surfical materials. Apparently the pond is not hydraulically independent of nearby wells and a large reservoir. The results invited speculation that kame plains occur over bedrock troughs. Such a relationship would speed search for good well sites in this region of rapid population growth and industrial development. (Sims - ISWS)

APPLICATION OF GEOCHEMICAL PRINCIPLES, ISOTOPIC METHODOLOGY, AND ARTIFICIAL TRACERS TO KARST HYDROLOGY,
Geological Survey, Reston, Va.
W. Back, and J. Zoetl.
Reprint from Hydrogeology of Karstic Terrains, International Union of Geological Sciences, Series B, No 3, Chapter IX, p 105-121, 1975: Paris, International Association of Hydrogeologists. 16 fig, 1 tab, 49 ref.

Descriptors: *Karst hydrology, *Geochemistry, *Groundwater movement, *Tracking techniques, Radioisotopes, Tracers, Tritium, Subsurface drainage, Hydrologic data.

Examples are presented of the application of the geochemical principles, isotope methods and tracing techniques to studies of karst hydrology. The main objectives of geochemical and isotope studies in karst terranes are: (1) to determine geographic and stratiographic distribution of chemical type of water; (2) to identify controlling reactions and their rates; and (3) to understand the physics of the system, i.e., source, types of springs, groundwater flow pattern, areas of recharge and discharge, and rate of movement. The purpose of achieving these objectives is: (1) to determine the availability and quality suitability of the water for utilization of municipal and domestic supplies, industrial requirements, or irrigation; (2) to predict temporal and spatial changes that occur as a result of imposing natural or man-made stresses on the system, such as injection of recharge water or wastes, additional withdrawal, diversion of flow by construction of dams or canals, or various activities that would permit encroachment of salt water. DETERMINING EMITTANCES FOR USE IN INFRARED THERMOMETRY: A SIMPLE TECHNIQUE FOR EXPANDING THE UTILITY OF EXISTING METHODS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
S. B. Idso, R. D. Jackson, and R. I. Reginato.
Journal of Applied Meteorology, Vol. 15, No. 1, p 16-20, January 1976. 4 fig, 14 ref.

Descriptors: *Infrared radiation, *Thermal radiation, *Temperature, Measurement, *Thermometers, Remote sensing, Radiation, Instrumentation, Optical properties, Physical properties, Analytical techniques, *Soil surfaces, Surfaces.
Identifiers: Infrared emittances, *Infrared thermometers.

A simple laboratory technique was described for making rapid emittance measurements with an infrared thermometer. It was shown that when the infrared thermometer head is held flush against a surface, its output is a linear function of surface emittance. Thus, viewing two or more surfaces of known emittance in this manner 'calibrates' the infrared thermometer, so that viewing an unknown surface at the same temperature in this manner will yield its emittance. Emittance values of the standard surfaces employed may be obtained via any of a variety of emittance measurement methods previously developed. A nomograph was presented that shows the possible errors that can occur as a result of temperature differences that may exist between the test and standard surfaces. (Sims - ISWS)

Identifiers: *Buckingham equation, Soil-water-air systems, *Moisture profiles, Gravichemical potential.

Differential equations which describe the equilibrium vertical distribution of moisture in swelling soil have been derived previously using both thermodynamic and fluid-mechanical methods. A fundamental disagreement exists

between these expressions which was resolved in this paper through a detailed thermodynamic analysis of the equilibrium state of water in a swelling soil. The correct differential equation for the moisture profile was found and the discrepancy between previous results was shown to have been caused either by introduction of extra-thermodynamic variables or by an incorrect handling of the effect of overburden pressure on the soil water. Identifiers: *Vermiculite, Chloritized vermiculite, Dechloritization, Rechloritization, Fixation, Origin, Upland.

Up to 560 kg/ha of elemental K fertilizer was required to obtain optimum yields and quality of tomatoes (Lycopersicon esculentum Mill.) on a low, well-drained terrace of the St. Joseph River in Berrien County, Michigan. The surface layer of the soil contained 15% clay with a Ca/Mg cation exchange capacity of 115 meg/100 g. This clay was capable of fixing about 94% of the applied K fertilizer. A study of the glacial geology and more recent geomorphology in the area showed that the oldest land surface had acid leached soils with the surface layer containing considerable chloritized vermiculitic clays, while, in contrast, the younger terraces had soils higher in pH and surface layers low in chloritized vermiculite. Analysis of the river terrace soils showed that if the pH was greater than 7.5 or less than 6.3 the vermiculite content of the surface layer dropped sharply. The vermiculite in the river terrace soils is apparently derived from chloritized vermiculitic clays from older upland soils. The change of the environment from acid to neutral or mildly alkaline plus abundant organic matter evidently triggers a dechloritization reaction involving aluminate or organic complexing mechanism. VARIATIONS IN THE PERMEABILITY OF SOILS IN VARIOUS NATURAL ZONES,
G. V. Nazarov.
Soviet Hydrology, Selected Papers, No. 4, p 263-270, 1974. 2 fig, 2 tab, 16 ref. Translated from News of the All-Union Geographic Society (Izvestiya VGO), No. 4, p 307-314, 1974.

Descriptors: *Permeability, *Soils, *Soil properties, *Variability, Soil water movement, Groundwater, Groundwater movement, Forest soils, Compacted soils, Pervious soils, Chestnut soils, Loam, Soil water, Soil physical properties.
Identifiers: *USSR.

Permeability largely determines the water balance of the soil, including surface runoff, and, therefore, one must know this soil property in hydrology to compute the amount of water absorbed by the soil. All soil properties vary considerably in time and space. Some of the properties vary not only within a distance of a few meters, but even over smaller distances. Experiments were performed on the variation in the permeability of various soils with a relatively small number of replications (from 12 to 18) near Zagorsk at the station of the Institute of Geography of the USSR Academy of Sciences as early as 1959. These experiments were continued in 1962 in the Streletsk steppe (Central Chernozem Reservation) with 51 replications. Starting from 1964, similar studies were made by the Limnological Institute of the USSR Academy of Sciences in several areas of the Northwestern European USSR and in the Northern Caucasus with 8 to 50 replications. In all, 529 experiments on 30 soils were made. Observations showed that the coefficient of variation of the permeability of soils in the forest zone varies from 56.6 to 138% in the first hour and the steady rate is 64.6 to 104%. In the steppe zone the coefficient of variation ranged from 15 to 72% in the first hour and from 15.5 to 95.5% in the second. (Sims-ISWS)

DETERMINATION OF THE PERMEABILITY OF THE PEAT DEPOSIT OF A LOWMOOR BOG,
L. G. Bavina.
Soviet Hydrology, Selected Papers, No. 5, p 293-299, 1974. 4 fig, 4 tab, 11 ref. Translated from Transactions of the State Hydrologic Institute (Trudy GGI), No. 222, p 83-92, 1974.

Descriptors: *Bogs, *Permeability, *Percolation, Infiltration, Water levels, Drainage effects, Wetlands, Peat, Marshes, Soil physical properties, Soil-water movement, Groundwater, Hydrologic properties, Hydrology.
Identifiers: *USSR.

The study program called for field determinations of the permeability of peat deposits by the method of level restoration in a well. The advantage of this method for investigating the permeability of peat over the pumping method, which is extensively used in practical hydrogeology, had been mentioned by several investigators. Although it is simple to perform field experiments by this method, it is difficult to justify it theoretically. There are several approximate working formulas. Their computation accuracy depends on the degree of correspondence between the theoretical premises used and actual conditions. It was found that, in determining the permeability of a moderately decomposed lowmoor peat deposit by the method of level restoration, any one of the formulas investigated can be used for computation, provided the heads in the well do not exceed 30-50 cm during a 10-min experiment. In computing the values of the percolation coefficients layer-by-layer in an undrained deposit, when several experiments with increasing well depth must be performed, one should use the formula of the All-Union Scientific Research Institute of Bog Management (VNIIBKh), derived on the assumption that water enters along the entire depth of the well. This assumption is valid for coefficients of 0.01-0.05 cm/sec. The coefficients decrease significantly under the effect of drainage, accompanied by a drop of 50 cm in average annual levels and an average settling of the peat deposit by 25-30 cm. (Sims-ISWS)

INVESTIGATIONS OF THE THAWING OF THE ACTIVE SOIL LAYER IN THE PERMAFROST ZONE,
Yu. P. Moskvin.
Soviet Hydrology, Selected Papers, No. 5, p 323-328, 1974. 4 fig, 2 tab, 5 ref. Translated from Transactions of the State Hydrologic Institute (Trudy GGI), No. 222, p 225-233, 1974.

Descriptors: *Frozen soils, *Thawing, *Permafrost, Frozen ground, Soil types, Soils, Bogs, Peat, Mosses, Tundra, Vegetation, Soil moisture, Temperature, Solar radiation.
Identifiers: *USSR, *Siberia, Thawing depths.

To exploit the gas fields in the northern part of West Siberia it became necessary to build roads to deliver equipment to the working, planning, construction, and exploitation sites of various industrial enterprises. This, in turn, required knowledge of the natural conditions in the construction region and, in particular, information on the thermal regime of thawing soils. Investigations were performed in 1971 in one of the regions in the extreme north of the West Siberian plain of the thawing of frozen soils of different landscape features and of the factors determining it. It was found that the active layer in plots without water at the surface, with a peat deposit, and a well developed plant cover thaws to a minimum depth. The depth of thawing on such plots does not exceed 40 cm in the warmest years. Water at the surface of a microlandscape increases the depth of thawing of the active layer by 20-25%, reaching 55-60 cm in the warmest years. In dry areas with clayey and loamy soils, the depth of thawing of the active layer exceeds that in areas with peat soils by a factor of 1.7-1.8. Differences in the nature of the plant cover (type of plants, their height, density, etc.) produce large difference in the depth of thawing of frozen soils in dry areas. The resulting difference in the depth of thawing ranges within 45-85 cm in the warmest years. Distrubance of the plant cover leads to a more than twofold increase in the depth of soil thawing. (Sims - ISWS)

SOIL MOISTURE FLUX AND EVAPOTRANSPIRATION DETERMINED FROM SOIL

HYDRAULIC PROPERTIES IN A CHAPARRAL STAND,
Forest Service (USDA), Albuquerque, N. Mex. Rocky Mountain Forest and Range Experiment Station.
D. G. School.
Soil Science Society of America Journal, Vol. 40, No. 1, p 14-18, January-February 1976. 3 fig, 1 tab, 11 ref.

Descriptors: *Water balance, *Soil water movement, *Evapotranspiration, *Forest soils, Forests, Evaporation, Hydraulic properties, Soil moisture, Flow, Flow measurement, Precipitation(Atmospheric), Rainfall, Analytical techniques, Darcys law, Hydraulic conductivity, Hydrology, Hydraulics.

Measurements of rainfall, overland flow, soil moisture, and hydraulic properties were obtained from a sloping plot in a chaparral stand. The moisture characteristic and dynamic conductivity were determined from core samples of several soil layers to a depth of 420 cm. A water balance model requiring the above parameters and a Darcian moisture flux analysis was used to predict drainage below the root zone and loss by evapotranspiration. Daily results of the water balance were summarized during 2 water years. Predicted values agreed well with values measured on a nearby watershed during both years--the first an unusually dry year, the second unusually wet. (Sims - ISWS)
W76-07083

BULK DENSITY, SATURATION WATER CONTENT AND RATE OF WETTING OF SOIL AGGREGATES,
MacDonald Coll., Ste. Anne De Bellevue (Quebec). Dept. of Soil Science.
F. A. Gumbs, and B. P. Warkentin.
Soil Science Society of America Journal, Vol. 40, No. 1, p 28-33, January-February 1976. 4 fig, 5 tab, 12 ref.

Descriptors: *Bulk density, *Saturated soils, *Wetting, *Soil aggregates, Soils, Clay loam, Evaporation, Soil moisture, Infiltration, Saturation, Aggregates, Particle size, Capillary action, Soil water, Laboratory tests.

Bulk density, degree of saturation, volume increase on wetting, and rate of wetting were measured for aggregates and clods of Ormstown silty clay loam (Humaquept) of sizes from 5 cm to 0.036 cm diameter. Bulk density increased with a decrease in diameter. For 2.2-mm to 0.36-mm diameter aggregates this increase was due to a surface area effect, i.e., loss in porosity as a result of subdividing larger aggregates. Both surface area effects and increased porosity from root channels and fissures were required to explain the increase for clods between 5 and 1 cm diameter. An evaporation and a sorption technique were described and used to estimate the water content of aggregates at saturation, i.e., the intra-aggregate water content. The evaporation technique gave reliable results at specific rates of evaporation, but the sorption technique was not as useful. Clods and aggregates of the soil and of pumice samples did not fully saturate; entrapped air accounted for 25 to 27% of the total pore volume. Aggregates of 1 and 2.2 mm diameter and clods of 1.0 and 5.0 cm diameter took about 1, 1.7, 45, and 1000 seconds, respectively, to saturate. This rapid wetting would minimize differences in potential between inter- and intra-aggregate water during infiltration. (Sims - ISWS)
W76-07084

SPATIAL VARIABILITY OF THE LEACHING CHARACTERISTICS OF A FIELD SOIL,
California Univ., Davis. Dept. of Land, Air and Water Resources.
J. W. Bigger, and D. R. Nielsen.
Water Resources Research, Vol. 12, No. 1, p 78-84, February 1976. 10 fig, 3 tab, 14 ref.

Descriptors: *Spatial distribution, *Leaching, *Soils, *Soil profiles, Salts, Pore water, Solutes, Infiltration, Diffusion, Sampling, Infiltration rates, On-site investigations, Soil water.
Identifiers: Field soil, Water-soluble salts, Pore water velocity, Diffusion coefficient, Sampling sites.

Solute distributions within a soil profile during the leaching of water-soluble salts applied to the soil surface were measured at six depths to 182.4 cm within 20 subplots of a 150-ha field. Estimates of the pore water velocity based upon measures of solute displacement within each subplot and the entire field were found to be logarithmically normally distributed and in agreement with the volumetric measures of water infiltration rates. Such agreement was possible only because it was recognized that the observed values were not normally distributed and their mean values were calculated accordingly. The number of observations required to yield an estimate of the mean pore water velocity within a prescribed accuracy was shown to depend upon the nature and extent of the spatial variability of the field soil. For the field examined, 100 observations allowed the mean pore water velocity to be estimated within + or -50% of its true value. The functional relation between field-measured values of the apparent diffusion coefficient, also found to be logarithmically normally distributed, and pore water velocity was examined and interpreted in terms of solute distributions likely to be measured at specific sampling sites. Identifiers: *Ionic distributions, Solute movement, Water flow models, Exchange equations, Plate model, Salt distribution, Rate theory.

The distribution of various cations and anions was measured with depth and time in a large lysimeter column periodically irrigated in saline water. Samples of the soil solution were removed with extraction cups placed at depths of 25, 50, 75, 100, 125, and 150 cm below the soil surface in the lysimeters. Observed ionic distributions were compared with calculated values obtained by combining transient water flow model with a chemical plate theory model. Good agreement was obtained in observing a predicted depth distribution profile for SO4(--), Cl(-), Na(+), and Ca(++). Soluble Mg(++) and HCO3(-) concentrations were overpredicted suggesting that further refinement of the chemical subroutine may be needed. (Henley - ISWS)

PREPARATION OF POLYESTER JACKETED SOIL COLUMNS AS PENETRATION, SUCTION PLATE AND GROUNDWATER LYSIMETERS, (IN GERMAN),
Goettingen Univ. (West Germany). Institut fuer Bodenkunde.
B. Homeyer, K. O. Labenski, B. Meyer, and A. Thormann.
Z Pflanzenernaehr Bodenkd. 136(3) p 242-245, 1973.

Descriptors: *Lysimeters, Groundwater, Soils, *Soil testing, Soil analysis, Methodology.
Identifiers: *Soil columns.

A simple and cheap preparation technique for long soil monolith lysimeters consists in forming columns of undisturbed soil out from the walls of soil pits by means of a steel cylinder, encasing the column with glassfiber mat and infiltrating this coat with polyester resin. Casing is also possible by simultaneous application of resin compounds and glassfiber as a mix spray. Imbedding steel slats in the polyester walls facilitates the transport. Descriptions are given how to make use of such columns as simple penetration lysimeters, suction plate, and groundwater lysimeter sets for studies of the water and bio-element balances of the soil.--Copyright 1975, Biological Abstracts, Inc.

DIFFUSIVITY OF WATER IN A NON-SATURATED HETEROGENEOUS ENVIRONMENT, (IN FRENCH),
State Coll. of Agronomical Science, Gembloux (Belgium).
C. Debouche, S. Gaspar, and L. Sine.
J Hydrol (Amst). 22(1/2), p 35-51, 1974.

Descriptors: *Diffusivity, Diffusion, Flow, Equations, Soils, *Soil water, Environment.
Identifiers: *Heterogeneous soils.

The diffusivity of the flow equation for water in soil was solved numerically in a horizontal soil column for an outflow case. A comparison is made between the results from homogeneous and from heterogeneous soils. The local or mean evaluation of the diffusivity do not agree, in heterogeneous soils, with the true local or mean values.--Copyright 1975, Biological Abstracts, Inc.

Akademiya Nauk Kazakhskoi SSR, Alma-Ata. Inst. of Microbiology and Virology.
A. N. Ilyaletdinov, and S. I. Suleimenova.
Mikrobiologiya. 43(1), p 141-145, 1974.

Descriptors: *Aeration, Microbiology, Flooding, *Soil microbiology, *Rice, Oxidation, *Organic matter, Aerobic conditions, Carbon, *Nitrogen, Crop production, Humus.
Identifiers: *Flooded soils, Organic carbon.

Microbial oxidation of soil organic matter under aerobic conditions at optimal humidity reduces the content of humus, total and easily hydrolyzed N. Losses of nutrient substances are proportional to the duration of aerobic incubation. Soils flooded immediately after the beginning of incubation had a higher biological activity and a higher content of organic C and N. The number of ammonifying and cellulose decomposing microorganisms decreases in the soil incubated under aerobic conditions as a result of a reduced content of easily hydrolyzed N. These results explain to some extent why rice crops are low following late sowing (end of May-beginning of June).--Copyright 1975, Biological Abstracts, Inc.

SOIL MOISTURE REGIME OF LOESSIAL SOILS IN WESTERN GERMANY AS AFFECTED BY ZERO-TILLAGE METHODS,
Goettingen Univ. (West Germany). Faculty of Agriculture.
W. Ehlers, and K. Baeumer.
Pak J Sci Ind Res. 17(1), p 32-39, 1974.

Descriptors: *Soil moisture, Europe, Loess, Soil types, Water storage, Infiltration, Porosity, Evaporation.
Identifiers: *Germany, Non-tillage.

Continued application of zero-tillage on structurally instable leossial soils resulted in reduced total porosity of the topsoil, in an increased structural homogeneity down the soil profile, and-due to enhanced earthworm activity-in a system of continuous large pores connecting the atmosphere with deeper soil layers. Conventionally tilled soils, though generally less densely packed than untilled soils, were more or less compacted at a depth of 25-30 cm, due to puddling and smearing actions during plowing. In consequence of the structural changes the water holding capacity of untilled soil was increased, yet the soil water tension was decreased as compared to tilled soils. Whereas in tilled soils, after heavy rainstorms, water infiltration was impeded by the plow pan, in untilled soil rainworm channels effected a rapid downward movement of rain water against the existing gradient of hydraulic potential. Thus run-off was decreased and water storage increased as compared to conventionally tilled soils. Also, near water saturation, the water conductivity of untilled soils was calculated to be greater than in tilled soils. Estimated losses by evaporation during rainless period were equal on both soils.--Copyright 1975, Biological Abstracts, Inc.

HORIZONTAL DIFFUSION CHARACTERISTICS IN LAKE ONTARIO,
Canada Centre for Inland Waters, Burlington (Ontario).
C. R. Murthy.
Journal of Physical Oceanography, Vol. 6, No. 1, p 76-84, January 1976. 9 fig, 5 tab, 6 ref.

Descriptors: *Diffusion, *Diffusivity, *Water circulation, *Dispersion, *Eddies, *Lake Ontario,

Great Lakes, Circulation, Currents(Water), Turbulence, Mixing, Movement, Mass transfer, Dyes, Fluorescent dye, Dye dispersion, Rhodamine, Lakes.
Identifiers: *Horizontal diffusion, Turbulent diffusion, Dye patches.

Experimental data on the diffusion of fluorescent dye patches were obtained in Lake Ontario, to study large-scale horizontal diffusion characteristics. In each experiment, a slug of water-soluble rhodamine dye solution was introduced at appropriate depths. The growth of the diffusing dye patch was followed up to 80 h after dye release, using fluorometric sampling. The data covered a length scale (i.e., patch size) of 100 m to 15 km and the corresponding eddy diffusivities varied from 100 to 1,000,000 sq cm/s. Several horizontal diffusion characteristics are constructed based on a simple theoretical framework. The longitudinal eddy diffusivity was found to be greater than the lateral eddy diffusivity by a factor of 5-10 during initial stages of diffusion and by a factor of 2-3 for long diffusion times. However, the combination of anisotropy of turbulence and vertical diffusion into the horizontal mean current produces an apparently distorted increase in longitudinal diffusion of the dye patch. Although the diffusion characteristics cannot be justified entirely from theoretical arguments, they could be viewed as purely statistical since they have been constructed from experimental data obtained in widely varying environmental conditions and provide useful guidelines for modeling practical diffusion problems. STEADY WIND-DRIVEN CURRENTS IN A LARGE LAKE WITH DEPTH-DEPENDENT EDDY VISCOSITY,
Oak Ridge National Lab., Tenn.
A. J. Witten, and J. H. Thomas.
Journal of Physical Oceanography, Vol. 6, No. 1, p 85-92, January 1976. 8 fig, 2 tab, 10 ref. NSF DES72-01338 A03.

Descriptors: *Water circulation, *Currents(Water), *Turbulent flow, *Momentum transfer, *Great Lakes, Lakes, *Lake Ontario, Movement, Circulation, Depth, Mixing, Turbulence, Viscosity, Winds, Steady flow, Model studies.
Identifiers: *Eddy viscosity, Drift currents, Turbulent momentum transport, Lake circulation modeling.

The theory of steady wind-driven currents in shallow water was extended to the case of a spatially variable eddy viscosity. The theory was first applied to the case of a pure drift current in water of constant depth, and a good fit with observed data was obtained. Subsequently, the theory was applied to a simplified model basin (representing Lake Ontario). Results were given for a uniform surface wind stress for different values of the surface eddy viscosity and a constant, and compared with results for a constant eddy viscosity. Although the vertically-integrated mass flux is fairly insensitive, the three-dimensional current pattern is fairly sensitive to the variations in the eddy viscosity. The results for the exponential eddy viscosity showed deeper coastal 'jets' as well as a weak central current not found in the case of a constant eddy viscosity. The pattern of return flow is changed, and there are significant differences in the pattern of upwelling and downwelling. The results pointed out the importance of more accurate representations of turbulent momentum transport in lake modeling. (Bender - ISWS)

TOPOGRAPHIC WAVES IN LAKE ONTARIO,
Woods Hole Oceanographic Institution, Mass.
G. T. Csanady.
Journal of Physical Oceanography, Vol. 6, No. 1, p 93-103, January 1976. 10 fig, 19 ref.

Descriptors: *Waves(Water), *Lakes, *Lake Ontario, *Lake shores, *Great Lakes, Topography, Winds, Circulation, Water circulation, Temperature, Thermocline, Limnology.
Identifiers: *Topographic waves, Kelvin waves, Rossby waves, Vorticity waves.

Properties of a topographic wave were calculated for an idealized shore zone model simulating the north shore of Lake Ontario. Observations at the Oshawa 'coastal chain' taken during the International Field Year on the Great Lakes were then scrutinized, concerning three flow-reversal episodes involving deep, barotropic currents. It was shown that the observed phenomena have characteristics very similar to those of the idealized topographic wave. A legitimate interpretation of the observed 12-16 day periodicities in longshore flow within the coastal zone of Lake Ontario is that they are caused by a combination of internal Kelvin waves and topographic waves. Although the speeds of these two kinds of vorticity waves are very similar in Lake Ontario, a careful consideration of the evidence clearly showed phase separation, particularly so late in the season when reduced density differences lead to a slowing down of internal Kelvin waves. (Sims - ISWS)

VARIATIONS IN THE LEVEL REGIME OF HIGHMOOR BOGS IN THE EUROPEAN USSR,
Ye. L. Balyasova.
Soviet Hydrology, Selected Papers, No. 5, p 281-292, 1974. 2 fig, 1 tab, 12 ref, 3 append. Translated from Transactions of the State Hydrologic Institute (Trudy GGI), No. 22, p 3-20, 1974.

Descriptors: *Bogs, *Water levels, *Marshes, Wells, Observation wells, Surveys, On-site investigations, Data processing, Wetlands, Peat, Mosses, Vegetation, Hydrologic properties, Hydrology.
Identifiers: *USSR.

One of the most important hydrologic characteristics of a bog, knowledge of which permits computing the other elements of the water regime (runoff, evaporation, and water storage in the peat), is its water level. Since it is simple to observe the water level in bogs, it is most practical to use these observations for hydrologic computations. Here observational data on water levels in 39 types of bog microlandscapes were analyzed and generalized. The results of the investigation lead to the following conclusions: (1) the invariability and constancy of mean annual, maximum, and minimum bog water levels of given probability have been proved for genetically similar microlandscapes, regardless of their location in bogs and the geographic location of the bogs themselves, making it possible to use the computed water-level characteristics of adequately studied bogs in engineering hydrologic computations for unstudied bogs of the same types in poorly accessible regions; (2) use of numerical methods makes it possible to establish the statistical homogeneity of samples of mean annual, maximum, and minimum bog water levels in genetically similar microlandscapes; and (3) combining homogeneous, independent samples of bog water levels for genetically similar microlandscapes increases the volume of information for computing the parameters of distribution curves. OPERATIONAL CHARACTERISTICS OF THE DECCA LAMBDA (6F) POSITIONING SYSTEM OVER FRESH WATER,
Department of the Environment, Ottawa (Ontario). Marine Sciences Directorate.
F. L. DeGrasse, and P. Brunavs.
International Field Year for the Great Lakes Technical Manual Series No. 7, 53 p, 20 fig, 2 tab, 4 ref. (1974).

Descriptors: *Navigation, *Surveys, *Great Lakes, *Lake Ontario, *Instrumentation, Evaluation, Bathymetry, Surveying instruments, Equipment, Lakes, International hydrological decade, Limnology.
Identifiers: *International Field Year for the Great Lakes.

Establishment of the DECCA LAMBDA (6f) positioning system for the International Field Year Great Lakes study of Lake Ontario and basin provided an excellent opportunity to evaluate the equipment in the hyperbolic mode and to determine phase lag effect on electromagnetic waves in a fresh water environment. A number of calibrations/evaluations were carried out throughout the Field Year under varying meteorological and land-sea media conditions to determine a more accurate figure for Velocity of Propagation of radio waves over fresh water and its application to electronic positioning in similar fresh water bodies. The bathymetric survey of Lake Ontario was described together with the automated collecting, processing and portrayal of the data. This survey is the first major effort at metrication in the Great Lakes. Phase lag observations with the hyperbolic Decca system over water of Lake Ontario were described and a comparison was made with theoretically obtained values. Satisfactory agreement indicated that the theoretical model is reliable and can be used for prediction of phase velocities in other freshwater lakes. (Sims - ISWS)

POPULATION OF GAMMARUS LACUSTRIS SARS (CRUSTACEA, AMPHIPODA) IN LAKE SEVAN DURING ITS DECREASE, (IN RUSSIAN),
Akademiya Nauk Armyanskoi SSR, Srevan. Hydrobiology Station.
A. G. Markosyan.
Biol Zh Arm. 27(1), p 28-35, 1974.

Descriptors: *Water level fluctuations, Lakes, Moss, *Crustaceans, *Amphipoda, Vegetation, Fecundity, Animal population.
Identifiers: *Gammarus-Lacustris, *USSR(Lake Sevan).

Investigation (1947-1967) established that the rate of lowering the level of Lake Sevan (USSR) adversely affected the development of the bottom vegetation and its related animal community, the members of which were the food components of the amphipods. This zone, which in the past had optimal feeding conditions for crustaceans, was disturbed markedly and its food resources decreased. The data on the reduction of the fecundity of the amphipods and decrease of the average size of individuals in the population indicated a deterioration of the habitat of amphipods in the lake and especially the feeding conditions. The fate of the population of G. lacustris in Lake Sevan after stabilization of the level, which began in the late 1960s, will depend on how quickly restoration of the 'moss and chara' zone and the rich phyto- and zoocoenoeses related with it occurs.--Copyright 1974, Biological Abstracts, Inc.

Identifiers: Barbus-Capito-Conocephalus, Carassius-Auratus-Gibelio, Chimkurgan, Reservoir, Kashka-Darya, Ophiocephalus-Argus-Warpachovskii, *USSR, Uzbek-SSR, Varicorhinus-Capoeta-Heratensis.

Investigations established that the commercial fish fauna of the Chumkurgan reservoir in the middle course of the Kashka-Dar'ya River in the Uzbek SSR (USSR) includes the pond crucian carp (Carassius auratus gibelio), Amur snakehead (Ophiocephalus argus warpachovskii), Samarkand khramulia (Varicorhinus copoeta heratensis), Turkestan barbel (Barbus capito conocephalus) and common carp (Cyprinus carpio). Of the acclimatized fishes maximum acceleration in growth was observed in pond crucian carp and Amur snakehead, since there is sufficient food in this reservoir for them. The fish population of the reservoir was formed due to local fish species of the Kashka-Dar'ya and fish species acclimatized and introduced from other waters of the USSR.--Copyright 1975, Biological Abstracts, Inc.

STUDY OF THE MACROZOOBENTHOS OF FLOOD PLAIN LAKES OF THE VAKHSH RIVER, (IN RUSSIAN),
Akademiya Nauk Tadzhikskoi SSR, Dushanbe. Institut Zoologii i Parazitologii.
F. Akhrorov.
Izv Akad Nauk Tadzh SSR Otd Biol Nauk. 1, p 54-58, 1974.

Descriptors: Lakes, Asia, *Benthos, *Aquatic insects, Diptera, *Mollusks, Mayflies, Reeds, Rivers, Productivity.
Identifiers: Amur, Coleoptera, Corixidae, Floodplain lakes, Odonata, Oligochaeta, Tadzhik-SSR, Trichoptera, *USSR(Vakhsh River).

An investigation of the benthos of the floodplain lakes of the Vakhsh River in the Tadzhik SSR (USSR) showed that the benthos consists mainly of larvae of aquatic insects (Chironomidae, Odonata and Ephemeroptera) and mollusks (46 spp. and forms). The most abundant and diverse group was the midges (Chironomidae) with 31 forms. The other groups--Oligochaeta, Trichoptera, Corixidae, Coleoptera--were identified incompletely. To improve the habitat and increase the productivity of the benthos of lakes of the lower reaches of the Vakhsh destroying the large masses of reeds by mowing and by introducing the herbivorous white amur is recommended.--Copyright 1975, Biological Abstracts, Inc.

MASS FORMS OF CHIRONOMID LARVAE FROM THE KAYRAKKUM RESERVOIR, (IN RUSSIAN),
Akademiya Nauk Tadzhikskoi SSR, Dushanbe. Institut Zoologii i Parazitologii.
F. Akhrorov.
Izv Akad Nauk Tadzh SSR Otd Biol Nauk. 2, p 73-78, 1974.

Descriptors: *Diptera, *Aquatic insects, Reservoirs, *Fish food organisms, Fish diets, Larvae.
Identifiers: Cricotopus-Silvestris, Cryptochironomus-Burganadzeae, Cryptochironomus-Conjugens, Cryptochironomus-Crassiforceps, Einfeldia-Pagana, Pelopia-Sp, Procladius-Ferrugineus, Tadzhik-SSR, Tanytarsus-Gregarius, *USSR(Kayrakkum Reservoir).

Based on material gathered from 1963-1968 in the Kairakkum Reservoir, Tadzhik SSR (USSR), dates and locations of finds and data of the biotypes, quantities, feeding habits and role as food for various fish are given for 8 Chironomidae (Diptera) species: Tanytarsus ex. gr. gregarius, Cryptochironomus burganadzeae, C. crassiforceps, C. ex.gr. conjugens, Einfeldia f. l. pagana, Cricotopus ex. gr. silvestris, Pelopia sp. and Procladius ferrugineus. These species are important as the basic mass of benthic fauna in the reservoir and comprise 75-80% of the food of bottom-feeding fish.--Copyright 1975, Biological Abstracts, Inc.

BIOLOGY OF THE RUDD SCARDINIUS ERYTHROPHTHALMUS (L) IN IRISH WATERS,
Inland Fisheries Trust, Dublin (Ireland).
M. Kennedy, and P. Fitzmaurice.
Proc R Ir Acad Sect B. 74(18), p 245-303, 1974.

Descriptors: Fish physiology, Larvae, Europe, Spawning, Fish reproduction, Bacteria, Algae, Lakes, Ponds, *Fish population, Aquatic insects, Invertebrates.
Identifiers: Abramis-Brama, Acanthocephala, Caddis-Fly, Chironomid, Cladocera, Corixidae, Posthodiplostomulum-Cuticola, *Rudd, Rutilus-Rutilus, Scardinius-Erythrophthalmus, *Ireland.

Material from 173 Irish waters included collections of eggs, larvae, post-larvae, fry, juveniles and adult rudd. The rudd is probably an introduced species in Ireland. It spawns mainly from late May to early July in weedy freshwater situations, usually close to the shore. Irish rudd eggs measure 1.375-1.75 mm in diameter; they are adhesive, transparent and colorless or pale yellow. The usually hatch in 5-7 days. The 1st food of the larval rudd is chiefly unicellular algae. By the time the post-larvae attain a length of about 1 cm they have begun to feed mostly on Cladocera, which are their main diet for the 1st 2 yr of life, though chironomid larvae and other invertebrates are also eaten. The diet of older rudd consists mainly of insects of various kinds taken at or close to the surface, together with filamentous algae and the young shoots of vascular plants. Corixids and invertebrates such as Gammarus, Asellus and caddis larvae (mostly picked off the weeds) are also eaten. The rudd is a long-lived, slow-growing fish; examples of rudd up to 17 yr old were examined. The fastest-growing rudd are found in limestone lakes of upwards of 80 acres in area. Small, weedy ponds often hold large populations of stunted rudd. Male rudd usually spawn for the 1st time 3 yr after they were spawned; the females usually spawn for the 1st time when 4 yr old. Hybrids between rudd and bream Abramis brama are common. Hybrids between rudd and roach Rutilus rutilus are much less frequent. The commonest parasites of Irish rudd are acanthocephalans and the trematode Posthodiplostomulum cuticola (black spot). Rudd appear to be relatively resistant to most bacterial diseases. They are hardy and can survive in water of poor quality.--Copyright 1975, Biological Abstracts, Inc.

ESTIMATION OF THE WATER HYDRATION IN WINTERING WHEAT LEAVES BY PROTON MAGNETIC RESONANCE,
Department of Agriculture, Ottawa (Ontario). Chemistry and Biology Research Inst.
F. D. H. MacDowall, and G. W. Buchanan.
Can J Biochem. 52(7), p 652-654, 1974.

Descriptors: *Wheat, *Leaves, *Estimating, Hydration, *Water of hydration, Frost.
Identifiers: Triticum-aestivum, *Proton magnetic resonance.

Water of hydration in whole tissues of wheat (Triticum aestivum) leaf sheaths was estimated by Kuntz' PMR method as the fraction of water that was withheld by macromolecular restraint from ice formation. The tissues bound up to 0.5 g water/gram dry weight. At -25 degrees C, which killed all tissues, the proton signals of unfrozen water were of greater magnitude from tissues and press sap of more hardy (frost resistant) plant material.--Copyright 1974, Biological Abstracts, Inc.

THE INTRODUCED ASIATIC CLAM, CORBICULA, IN CENTRAL ARIZONA RESERVOIRS,
East African Agriculture and Forestry Research Organization, Nairobia (Kenya).
J. N. Rinne.
Nautilus. 88(2), p 56-61, 1974.

Descriptors: *Reservoirs, *Clams, *Arizona, Turbidity, *Biomass, Predation.
Identifiers: Asiatic clam, Corbicula.

Horizontal and vertical density and biomass of Corbicula in 2 central Arizona reservoirs were estimated employing m2 quadrats and Ekman dredge sampling. Concentrations of clams increased with depth of water and, down-lake from inflow areas were characterized by greater turbidity (suspended sediment). Densities were highest on rock-rubble slopes and increased directly with complexity of substrate. Food supply, substrate, turbidity and perhaps fish predation are probably important factors in determining the density and biomass of clams in the 2 reservoirs.--Copyright 1974, Biological Abstracts, Inc.

THE INFLUENCE OF MOISTURE STRESS ON LIRIODENDRON TULIPIFERA L. SEEDLINGS,
Virginia Polytechnic Inst. of State Univ., Blacksburg. Dept. of Forestry and Forest Product.
P. E. Pope, and H. A. I. Madgwick.
Ann Bot (Lond). 38(155), p 431-439, 1974.

Descriptors: *Trees, *Deciduous trees, *Moisture stress, *Soil-water-plant relationships, *Plant growth, Seeds, Leaves.
Identifiers: Liriodendron-Tulipifera, *Seedlings, *Yellow poplar.

A comparison of yellow poplar seedlings subjected to available moisture ranging from 100%-20% of field capacity in 2 separate experiments (a soil study and a solution study) indicated that total dry matter production, stem height, total leaf area and area of individual leaves, decreased with increased moisture stress. Differences in unit leaf rate (ULR) were primarily responsible for final plant size. Leaf area: weight ratio was affected by the method of induced stress. As stress increased the ratio increased in the soil study but decreased in the solution study. The number of leaves produced was unaffected by stress, except at the most severe stresses. The number of senescent leaves increased as moisture stress increased. The allocation of new growth was unaffected by either moisture stress or time and decreased in order of root, foliage, stem for the soil grown plants and foliage, root, stem for the solution grown plants. ULR and relative growth rate (RGR) were reduced by both moisture stress and time. A growth simulation of the soil-grown plants based on results from the solution moisture stress experiment predicted the final plant dry weight within 12% and leaf area within 7% of the actual values.--Copyright 1974, Biological Abstracts, Inc.

WATER TRANSPORT IN PLANTS: MECHANISM OF APPARENT CHANGES IN RESISTANCE DURING ABSORPTION,
Illinois Univ. at Urbana-Champaign. Dept. of Botany.
J. S. Boyer.
Planta (Berl). 117(3), p 187-207, 1974.

Descriptors: *Absorption, Water uptake, *Water requirements, *Plant growth, Transpiration, Leaves.
Identifiers: Helianthus-Annuus.

Leaf water potentials were measured at various rates of water absorption in whole plants and detached leaves of well-watered Helianthus annus L. The experiments were conducted in the steady state, where changes in leaf hydration did not affect the measurements but both the transpiration and growth components of absorption could be observed. The resistance at low fluxes was about 30 times the resistance at high fluxes. Most of the change took place in the leaves, since similar changes could be demonstrated in detached leaves. Measurements of rates of water movement in and out of the protoplasm were made when gradients in water potential between the protoplasts and the water source were varied. The high temperature sensitivity of efflux confirmed that the leaf protoplasts limited flow in these experiments. When the edge of the leaf was excised and flow occurred primarily through the vascular system of the leaf, the resistance was much lower than in the protoplasts. Calculations based on a model of water transport showed that the protoplast resistance was almost 30 times larger than the resistance of the path leading from the soil to the leaf protoplasts. The decrease in resistance of the leaves with increasing rates of absorption was attributed to a decrease in water movement in an out of leaf cells, which involved a high resistance, and an increase in movement around the leaf protoplasts, which involved a low resistance. Since the experiments were conducted at the steady state, the high resistances were apparent at low rates of flow where only growth occurred, whereas the low resistances could be observed at high rates of flow because growth did not occur and flow consisted solely of transpiration. Because of the high resistance of the protoplast pathway, leaf water potentials were governed more by protoplast water movement than by transpiration over a considerable range of rates of water absorption. This may explain some of the differences in earlier work on leaf water potentials and water transport.--Copyright 1974, Biological Abstracts, Inc.

WATER REGIME AND CONTENT OF PHOSPHORUS COMPOUNDS OF ACID-SOLUBLE FRACTION IN COTTON LEAVES AT DIFFERENT WATER-SUPPLY LEVELS, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Inst. of Plant Physiology.
N. S. Petinov, Kh. S. Samiev, and K. G. Marfina.
Fiziol Biokhim Kul't Rast. 6(1), p 9-15, 1974.

Descriptors: *Phosphorus, *Cotton, Leaves, *Water supply, Acids, Respiration.

Respiration intensity and synthetic activity of leaves were at a higher level in the wilt-resistant cotton Tashkeni 2' than in 108-F. With severe and long soil drought (soil moisture 46% of field capacity in Tashkent 2) a sharp drop was observed in the organic P content which was not restored by the addition of water. This indicates a deep disturbance not only in water-exchange but also in the protoplasmatic structures.--Copyright 1975, Biological Abstracts, Inc.

STUDIES ON THE MOVEMENT OF SALMON AND TROUT FRY AND INVERTEBRATES INTO FLOODED AREAS, (IN NORWEGIAN),
Zoologisk Museum, Oslo (Norway).
A. Lillehammer.
Fauna (Oslo). 27(2), p69-73, 1974.

Descriptors: *Salmon, *Trout, *Invertebrates, *Aquatic insects, Water level fluctuations, *Fry, Productivity.
Identifiers: Flooded area, *Norway.

In the Suldalslagen River, where there is great variation in the watercourse, young salmon and trout follow the variations in the water level and move up into flooded areas. They also move into small streams in June and July. Territorial occupation seems to be of short duration at this time. The invertebrate fauna, mostly insects, also rapidly colonizes flooded areas and the fry have a good supply of suitable food. Variations in the water level may have a positive effect on the productivity of the rivers.--Copyright 1975, Biological Abstracts, Inc.

THE DESIGNATION OF TWO ECOLOGICAL GROUPS OF AQUATIC INVERTEBRATES, (IN GERMAN),
Eotovs Lorand Univ., Budapest (Hungary). Inst. for Systematic Zoology.
A. Berczik.
Opusc Zool (Budap). 12(1/2), p 33-41, 1972.

Descriptors: *Invertebrates, Diptera, Aquatic insects, Life cycles, Ecology.
Identifiers: Ephemeroptera, Odonata, Plecoptera, Trichoptera, Holohydrobionts, Hemihydrobionts.

Insect species of which only the developmental stages are aquatic are characteristic of the invertebrate fauna of inland waters. From the coenological and energy turnover points of view these species differ from organisms which are aquatic during their entire life cycle and can be segregated without regard to systematic categories. Species or organisms spending their entire life in water are herein designated as holohydrobionts, and species or organisms aquatic only during their developmental stages (among the holomorphotic insect groups, e.g. Ephemeroptera, Odonata, Plecoptera, Trichoptera, Diptera, etc.) as hemihydrobionts. The justification of this categorization rests on ecological, coenological and energy turnover arguments.--Copyright 1975, Biological Abstracts, Inc.

THE EFFECT OF WATER STRESS ON THE EXUDATION OF CARBOHYDRATES BY THE ROOTS OF PICEA ABIES (L.) KARST AND OTHER YOUNG CONIFERS, (IN GERMAN),
Technische Universitaet, Dresden (East Germany). Bereich Biologie.
M. Tesche.
Flora (Jena). 163(1/2), p26-36, 1974.

Descriptors: *Carbohydrates, *Conifers, Drought, Roots, Moisture content, Soils.
Identifiers: Larix-Decidua, Larix-Gmelinii-Var-Japonica, *Picea-Abies, Picea-Omorika, Pinus-Nigra, Pinus-Sylvestris, Pseudotsuga-Menziesii, *Water stress.

When seedlings with roots exposed of Picea abies, Pseudotsuga menziesii (Mirb.) Franco, Larix decidua Mill., L. gmelinii var. japonica (Maxim et Regel) Pilg., Pinus sylvestris L., Pinus nigra Arnold, and Picea omorika (Panc) Purk. are subjected to water stress, exudation of carbohydrates by the roots is strongly increased. The increase of carbohydrate exudation correlates with the degree of damage caused to the water-stressed plants. The effects of the duration of water stress, age of plant and soil drought of the site on exudation was investigated and besides carbohydrates P compounds as well as UV light absorbing substances were analyzed in the exudates. The results show that the quantity of exudates grows with increasing duration of water stress. Older plants exude large quantities of carbohydrates after water stress that younger ones, and soil drought just as air drought encourages exudation of carbohydrates.--Copyright 1975, Biological Abstracts, Inc.

INVESTIGATIONS ON THE CO2 BALANCE OF SUBMERGED HIGHER WATER PLANTS IN RUNNING WATER BY MEANS OF A MOBILE LABORATORY FOR INFRARED GAS ANALYSIS, (IN GERMAN),
Technische Universitaet, Dresden (East Germany). Bereich Hydrobiologie.
W. Horbach, L. Hornig, and G. Weise.
Int Rev. Gesamten Hydrobiol. 59(1), p 17-29, 1974.

Descriptors: *Carbon dioxide, Aquatic plants, *Submerged aquatic plants, Phytoplankton, River, Periphyton, Infrared radiation.
Identifiers: Amblystegium-riparium, Amblystegium-riparium-f-fontinaloide, *Germany, Hygrohypnum-ochraceum-f-obtusifolia, Potamogeton-trichoides, *Infrared gas analysis, Macrophytes.

The CO2-balance of Hygrohypnum ochraceum f. obtusifolia, Amblystegium riparium, A. riparium f. fontinaloides and of Potamogeton trichoides (Potamogetonaceae) was investigated by means of a transportable laboratory for IR gas analysis. The experiments were carried out in the river Mulde (E. Germany) by means of glass vessels exposed to the water body. The device for continuous measurement of CO2 exchange was operated by pumping air through the vessels containing 4 l of the water. The water plants exhibited a distinct day night rhythm of CO2 turnover. In some cases river water alone, which had percolated a tampon of Perlon fibers, also showed a considerable day night rhythm of CO2 turnover which had to be attributed to phytoplankton and suspended periphyton organisms, the activity of which is superimposed above the photosynthetic activity of the macrophytes. Measurement of the CO2 balance of submerged plants in water containing microphytes can only be attributable to the macrophytes if the time of exposition does not exceed one day.--Copyright 1975, Biological Abstracts, Inc.
W76-07312

RESPONSES OF ASTRAGALUS TENNESSEENSIS TO DROUGHT: CHANGES IN FREE AMINO ACIDS AND AMIDES DURING WATER STRESS AND POSSIBLE ECOLOGICAL SIGNIFICANCE,
Kentucky Univ., Lexington. School of Biological Sciences.
C. C. Baskin, and J. M. Baskin.
Oecologia (Berl). 17(1), p 11-16. 1974.

Descriptors: *Drought tolerance, *Amino acids, Climates, Ecology, Aquatic plants, Plant physiology.
Identifiers: *Amides, *Astragalus-Tennesseensis, Cedar habitat.

To better understand the adaptations of A. tennesseensis to its summer-dry cedar glade habitat, comparisons were made of the free amino acids and amides in leaves of drought- and nondrought-treated plants. No qualitative differences were detected; 13 free amino acids and 2 amides were identified. Water stressed plants showed a 115% increase in the total amount of amino acids and amides over nondrought stressed plants. Proline accounted for 30.1% of the increase and aspartic acid 37.1%. Water stress caused an increase in the 2 amides and in 11 of the 13 amino acids; alanine and serine decreased. Upon rewatering, the total amount of amino acids and amides quickly decreased. The ability of accumulate proline and aspartic acid may be of adaptive value to A. tennesseensis during short periods of drought.
W76-07397

VARIATION IN DROUGHT TOLERANCE IN EUCALYPTUS VIMINALIS LABILL,
Melbourne Univ., Parkville (Australia). School of Botany.
P. Y. Ladiges.
Aust J Bot. 22(3), p 489-500, 1974.

Descriptors: *Drought tolerance, Plant physiology, Stomata, Transpiration, Soil types.
Identifiers: *Eucalyptus-Viminalis.

Six-month-old seedlings of 2 low rainfall populations of E. viminalis showed greater resistance to desiccation and were less damaged by sustained drought than seedlings from 2 high rainfall populations. The more resistant seedlings did not simply avoid drought by quickly closing stomata, but were capable of maintaining relatively high rates of transpiration under moderate moisture stress. The 2 populations from moist habitats wilted at a higher relative turgidity of leaves than did the populations from the drier habitats. Furthermore, for populations from 1 dry habitat and 1 moist habitat, changes in relative turgidity in relation to water potential of leaves during drying were not significantly different. The greater tolerance of the low rainfall populations to drought is probably related to physiological resistance of the protoplasm to desiccation. Some differences in drought resistance were also noted between the 2 low rainfall populations. Young seedlings (3 mo. old) from a population on a deep basalt-derived soil were less resistant than young seedlings from a neighboring population on a shallower granite soil. The selection for drought tolerance at the granite site may have been more severe than at the basalt site.--Copyright 1975, Biological Abstracts, Inc.

STUDIES ON LEAF CHARACTERISTICS OF A CLINE OF EUCALYPTUS URNIGERA FROM MOUNT WELLINGTON TASMANIA: I. WATER REPELLENCY AND THE FREEZING OF LEAVES,
Institut National de la Recherche Agronomique, Versailles (France). Station Centrale d'Bioclimatology.
D. A. Thomas, and H. N. Barber.
Aust J Bot. 22(3), p501-512, 1974.

Descriptors: *Leaves, Plant physiology, *Australia, Seasonal, Evaporation.
Identifiers: Cline, *Eucalyptus-Urnigera, *Tasmania.

A cline in E. urnigera is described in which waxy glaucousness of the surfaces of leaves increases with altitude up Mount Wellington(Australia). Other leaf characteristics, such as adult shape, anthocyanin content of young leaves, and age of transition to adult leaf form, may also vary. If the leaves of E. urnigera with a dry surface are cooled, they freeze at a temperature of -8 to -10C. If the leaves are wet, they freeze at -2 to -4C. Such freezing always kills the leaves, whereas leaves which have supercooled below the true freezing point (-2 to -3C) escape damage. The ability of dry leaves to supercool may explain part of a selective advantage possessed by the gluacous water-repellant leaves of E. urnigera at high altitudes as compared with the green wettable leaves of plants at low altitudes. This selective advantage of water repellency is probably of ecological significance in protecting leaves from freezing when there are rapid falls in the ambient temperature below about -2 to -3C, either as radiation frosts or as short periods of snow after plant growth has started in the spring.--Copyright 1975, Biological Abstracts, Inc.

EXOTIC FISHES IN FRESH AND BRACKISH WATERS OF FLORIDA,
Florida Atlantic Univ., Boca Raton. Dept. of Biological Sciences.
W. R. Courtenay, Jr., H. F. Sahiman, W. W. Miley, II, and D. J. Herrema.
Biol Conserv. 6(4), p 292-302, 1974.

Descriptors: Florida, Brackish water, Fish.
Identifiers: Channelization, *Exotic fishes, Environmental impact statements.

At least 38 spp. and several hybrids of exotic fishes were found in fresh and brackish waters of Florida. At present 20 spp. and 5 hybrids are established in the form reproducing populations. The ornamental aquarium fish industry has been the major source of these introductions. Several methods of introductions are considered and recommendations presented toward preventing repetitions in the future. Future dispersal of exotics by channelization projects should become part of environmental impact statements.--Copyright 1975, Biological Abstracts, Inc.

TIMBER HARVEST AS AN AGENT OF FOREST STREAM CHANNEL MODIFICATION,
Forest Service (USDA), Parsons, W. Va. Northeastern Forest Experiment Station.
W. S. Platts, and W. F. Megahan.
In: Transactions, 40th North American Wildlife and Natural Resources Conference, 1975. Wildlife Manage. Inst., Washington, D.C., p. 229-239. (1975).

Descriptors: *Anadromous fish, Aquatic environment, *Stream erosion, Particle size, *Fish spawning, *Salmon, Rainbow trout, Logging, Erosion, Idaho, Sedimentation, Scour, Road construction, Aggradation, Degradation, Riverbed, Demonstration watersheds, *River beds.
Identifiers: *South Fork Salmon River(Idaho), Granitic soils, *Idaho Batholith time trend.

The South Fork Salmon River is an important chinook salmon and steelhead trout fishery in the mountains of central Idaho. Because of increased logging, road construction, and severe floods after 1950, excessive sediment, especially fines, was deposited in the river channel, seriously damaging the major spawning areas by 1966. A study was designed to evaluate trends in the size of riverbed surface materials in four major spawning areas in the upper half of the river. The size composition of materials favorable for spawning improved greatly from 1966 to 1974; a large decrease in fines was accompanied by a large increase in gravels and a lesser increase in rubble. The change in spawning materials resulted from a reversal of the previous high rate of sediment flow into the channel system compared to sediment flow out of the system. The reductions in watershed erosion and sediment entry into the river resulted from: (1) a moratorium on logging and road construction activities on the watershed; (2) natural watershed stabilization processes; and (3) a watershed rehabilitation program. This study demonstrates that sediment damage to a valuable fishery resource is not irrevocable and illustrates the need to program future logging and road construction over both time and space to avoid degradation of salmonid spawning areas. A SOLVABLE MODEL OF 'SHEAR DISPERSION',
National Oceanic and Atmospheric Administration, Miami, Fla. Atlantic Oceanographic and Meteorological Labs.
W. C. Thacker.
Journal of Physical Oceanography, Vol. 6, No. 1, p 66-75, January 1976. 9 fig, 10 ref.

Descriptors: *Dispersion, *Silts, *Model studies, Mathematical models, *Mixing, *Diffusion, Path of pollutants, Water pollution, Silting, Water circulation.

Shear dispersion results from vertical shear of horizontal velocity and vertical mixing, features which cannot be included explicitly in one-layer, vertically integrated models. The parametric description of shear dispersion as effective horizontal diffusion in one-layer models was investigated by comparing analytic solutions of two-layer dispersion equations to the corresponding solutions of a one-layer diffusion equation. The diffusion description was found to be poor for times comparable with or shorter than the vertical mixing time but excellent for longer times. (Sims - ISWS)

DESCRIPTION OF A NEW TYPE OF CORER FOR VERY FLUID SEDIMENTS, (IN FRENCH),
Toulouse-3 Univ. (France). Laboratoire d'Hydrobiology.
N. Giani.
Ann Limnol. 10(1), p99-108, 1974.

Descriptors: Sediments, Sampling, Distribution, Lakes, *Lake sediments.
Identifiers: Corer(Sediments), Mountain lakes.

This new corer was designed particularly for fluid sediments. It consists of a tube, 8 cm in diameter which closes at both ends. Its performance is superior to that of an Ekman grab under the same conditions. The reasons for this difference are analyzed. It is also possible to study the vertical distribution of the fauna with this corer. Some preliminary results from a high mountain lake are given.--Copyright 1975, Biological Abstracts, Inc.

THE PRECIPITATION CHEMISTRY OF WESTERN NEW YORK STATE: A METEOROLOGICAL INTERPRETATION,
Cornell Univ., Ithaca, N. Y.
A. C. Dittenhoefer, and B. E. Dethier.
Cornell University Water Resources and Marine Sciences Center, Ithaca, N.Y. April 1976. 45 p, 7 fig, 11 tab, 49 ref. OWRT A-044-NY(1) 14-31-0001-3532.

Descriptors: Air circulation, Air masses, Air pollution, *Chemistry of precipitation, *Precipitation(Atmospheric), Weather patterns, *New York, Meteorology, *Rain water, Sulfates, *Rainfall.

Precipitation chemistry data for western New York were studied and through the use of 12- and 24-hour isentropic trajectories, the distant source regions and paths of long-range transport were determined. Meteorological variables such as surface wind speed and direction, height of the mixed layer, mean relative humidity below cloud base, and the past histroy of precipitation were monitored to assess their importance in controlling rainwater concentrations. Ionic constituents such as sulfate owe much of their presence in rainwater to wet removal from the rain-producing layers (1-5 km), where their concentration is largely influenced by long-range transport. Local sources affecting the precipitation chemistry of the region are wide-spread and contribute little to the variance of chemical concentration. Constituents derived from the soil, such as potassium, calcium, ammonium, and magnesium, seem to be directly related to trajectory wind speed and atmospheric instability. Results from a precipitation sampling network in western New York indicate that air mass precipitation is characterized by markedly higher ionic content compared to frontal rainfall, and that rainfall pH is significantly lower in air mass precipitation.

STREAMFLOW CHEMISTRY AND NUTRIENT YIELDS FROM UPLAND PEATLAND WATERSHEDS IN MINNESOTA,
Forest Service (USDA), St. Paul, Minn. North Central Forest Experiment Station.
E. S. Verry.
Ecology Vol 56, No 5, p 1149-1157, Late Summer, 1975. 4 fig, 7 tab, 39 ref.

Descriptors: *Streamflow, Chemistry, *Water quality, *Peatlands, Bogs, Fens, Watersheds(Basins), *Minnesota, *Nutrients, *Water chemistry, *Pollutant identification.

Twenty-two water quality parameters were determined for the streamflow from complex but typical upland-peatland watersheds over a period of 5 yr. Five watersheds with oligotrophic peatlands and one with a minerotrophic peatland were studied. Concentrations of organically derived nutrients are highest in the streamflow from watersheds containing oligotrophic peatlands; while concentrations of nutrients derived from solution of aquifer minerals are higher in streamflow from the watershed containing a minerotrophic peatland. However, flow-weighted concentrations of organically derived nutrients are similar for both watersheds. Annual nutrient yields (kilogram/hectare per year) calculated for two of the tight upland-oligotrophic peatland watersheds are generally low and are quite similar to values for other forested areas in North America which do not contain peatlands. THE USE OF ION EXCHANGE METHODS FOR THE DETERMINATION OF TRACE ELEMENTS IN NATURAL WATERS-I: COBALT, (IN GERMAN),
Vienna Univ. (Austria). Analytisches Institut.
J. Korkisch, and D. Dimitriadis.
Talanta. 20(12), p 1287-1293, 1973.

Descriptors: *Cobalt, Pollutant identification, *Ion exchange, *Analytical techniques, Anions, Trace elements, Methodology, *Water analysis, Metals.

Two methods are described for the determination of Co in natural waters. In the 1st, the sample is acidified with HC1, then ascorbic acid and potassium thiocyanate are added and the solution is run through a column of strongly basic anion-exchanger (Dowex 1-X8). The Co thiocyanate complex is retained on the column while other ions are washed through with a mixture of organic solvent, aqueous HC1. The Co is then eluted with purely aqueous 6M HC1 and determined photometrically with nitros-R salt. In the 2nd method, (for very dirty samples) the filtered sample is taken through a multi-step evaporation procedure and then added to the column in the mixed solvent. Result are presented for many samples collected in Lower Austria. (See also W76-07409 and W76-07410)--Copyright 1975, Biological Abstracts, Inc.
W76-07408

THE USE OF ION EXCHANGE METHODS FOR THE DETERMINATION OF TRACE ELEMENTS IN NATURAL WATERS-II: CADMIUM, (IN GERMAN),
Vienna Univ. (Austria). Analytisches Institut.
J. Korkisch, and D. Dimitriadis.
Talanta. 20(12), p 1295-1301, 1973.

Descriptors: *Cadmium, Metals, *Ion exchange, *Pollutant identification, Analytical techniques, *Water analysis, Anions, Trace elements, Methodology, Spectrophotometry.

A method is described for the isolation of ppm levels of Cd from natural waters and their spectrophotometric determination. The water samples (1.1) is made 1.2M in HC1 or 1.0M in HBr, filtered and passed through a column of Dowex 1-X8 (chloride form) anion-exchanger. The Cd is quantitatively sorbed and simultaneously separated from other trace metals in the sample. Co-adsorbed Zn is removed with 0.15M HBr, and the Cd eluted with 2M HNO3 and determined by the dithizone method. Many Austrian water samples have been analyzed and found to contain 0.1-4.0 ppm of Cd. APPLICATION OF ION EXCHANGE METHODS FOR THE DETERMINATION OF TRACE ELEMENTS IN NATURAL WATERS-III: THORIUM, (IN GERMAN),
Vienna Univ. (Austria). Analytisches Institut.
J. Korkishc, and D. Dimitriadis.
Talanta. 29(12), p 1303-1308, 1973.

Descriptors: Trace elements, *Pollutant identification, Methodology, *Water analysis, Analytical techniques, Anions, Spectrophotometry.
Identifiers: *Thorium.

A method is described for separation of ppb levels of Th from natural waters and a spectrophotometric finish. A 1-1 water sample is acidified with nitric acid and filtered, then evaporated, and the Th absorbed on Dowex 1-X8 strongly basic anion-exchanger (nitrate form) from 8M nitric acid to separate it from accompanying elements. The Th is eluted with 6M hydroc holoric acid and determined spectrophotometrically by the Arsenazo III method. The method was applied to determination of Th at the 0.4-4.5 ppb level in Austrian natural waters. (See also W76-07408 and W76-07409)--Copyright 1975, Biological Abstracts, Inc.

COVARIANCE FUNCTIONS AND SPECTRA OF A RANDOM WAVE FIELD,
North Carolina State Univ., Raleigh. Dept. of Civil Engineering.
C. C. Tung, and K. Pajouhi.
Journal of Physical Oceanography, Vol. 6, No. 1, p 104-107, January 1976. 11 ref.

Descriptors: *Oceanography, *Gravity waves, *Velocity, *Statistical methods, Free surfaces, Probability, Fluid mechanics, Stochastic processes, Analytical techniques.
Identifiers: *Covariance functions, Spectra, Random wave field.

Statistical properties of random wave field associated with both surface waves and internal waves have been investigated to understand wave dynamics and to interpret field measurements. covariance functions and spectra of components of fluid particle velocity are obtained, taking into consideration the effect of free surface fluctuations, for a Gaussian, stationary and homogeneous random gravity wave field in deep water, using infinitesimal wave solutions. Approximate representations of the covariance functions and spectra differ from those when the effects of free surface fluctuations are ignored, especially at, around and above the equilibrium surface. The covariance function is only one-fourth of that when the free surface fluctuations are ignored. (Singh-ISWS)

SOME ASPECTS OF THE FORCED RESPONSE OF STRATIFIED COASTAL REGIONS,
Oregon State Univ., Corvallis. School of Oceanography.
J. S. Allen.
Journal of Physical Oceanography, Vol. 6, No. 1, p 113-119, January 1976. 2 fig, 1 tab, 9 ref.

Descriptors: *Oceanography, *Seashores, *Continental shelf, *Ocean waves, *Wind tides, Model studies, Upwelling, Internal waves, Coastal engineering.
Identifiers: *Meterologic forcing, Baroclinic component, Barotropic component, Wind stress.

A two-layer model with an idealized continental shelf and bottom slope topography is utilized to study some properties of the response of stratified coastal regions to meteorological forcing by an alongshore wind stress composed of uncoupled baroclinic and barotropic components. The coastline is assumed straight with no alongshore variations in the bottom topography. The baroclinic component consists of forced internal Kelvin waves and the barotropic component consists of forced continental shelf waves. The alongshore and time-dependent behavior of the baroclinic and barotropic components is governed by forced, first-order wave equations. The response to an impulsively applied, upwelling-favorable wind stress with a specialized alongshore structure is studied to give insight into the qualitative nature of the

behavior of the forced time-dependent, baroclinic and barotropic components. The solution shows how the region of forced upward motion of density surfaces may propagate alongshore to locations distant from that of the wind stress which causes the upwelling. (Singh-ISWS)

Available from the National Technical Information Service, Springfield, Va 22161, as PB-252 272, $4.00 in paper copy, $2.25 in microfiche. Report R-1884-OWRT, October 1975, 23 p. $1.50 OWRT C-5252 (no. 4237)(3).

Descriptors: Computer programs, Coasts, Seas, Flow, *Estuaries, *Mathematical models, *Numerical methods, Tides, Fluid dynamics, Computer models, Coastal engineering, Simulation analysis, Unsteady flow, Model studies, Finite element analysis.
Identifiers: Coastal seas.

A computer program of a three-dimensional model for estuaries and coastal seas, as it stands at the end of the second phase of a three-phase program, is presented. The program can perform numerical integration of the equations of motion, the equation of continuity, and the equations representing transport of salt and temperature. A complicated equation of state is used. Vertical mass and momentum transfer coefficients are computed from density and velocity information. The program is experimental. The aspects of computation are described in R-1764-OWRT, A Three-Dimensional Model for Estuaries and Coastal Seas: Volume II, Aspects of Computation, by Jan J. Leendertse and Shiao-Kung Liu. (See W75-10900).
W76-07016

MEASUREMENT OF SEA SURFACE TEMPERATURE BY THE NOAA 2 SATELLITE,
Environmental Research and Technology, Inc., Concord, Mass.
J. L. Cogan, and J. H. Willand.
Journal of Applied Meteorology, Vol. 15, No. 2, p 173-180, February 1976. 4 fig, 3 tab, 20 ref. Navy N66314-73-C-1749

Descriptors: *Remote sensing, *Water temperature, *Oceans, Satellites(Artificial), Data processing, Analytical techniques, Radiation, Infrared radiation, Clouds, Absorption, Moisture, Instrumentation, Oceanography.
Identifiers: *NOAA-2, Radiometers.

Sea surface temperature (T sub s) may be inferred to a useful accuracy from satellite measurements of infrared radiances in the atmospheric windows. However, even in the absence of clouds, the slight opacity produced by water vapor continuum, carbon dioxide, ozone and aerosol absorption causes the temperature 'seen' by the satellite to be lower than that measured by ships or aircraft. The difference between (T sub s) and the temperature inferred from infrared radiances when looking vertically through a cloud-free atmosphere was estimated to about plus or minus 0.5 K for the 10.5-12.5 micrometer window of the scanning radiometer of NOAA 2 when data on certain atmospheric variables are available. A simple parametric formula in terms of integrated water vapor content gave about that accuracy while saving considerable computation time. It was found that T sub s may be estimated to an accuracy of about plus or minus 1 K within about 500 km of the subsatellite track in the Mid-Ocean Dynamics Experiment area in a comparison of satellite data with ship and aircraft measurements, despite various sources of possible error. An area represented by each mapped T sub s of about 40 kmx40 km could be attained for areas that were nearly cloud-free. (Sims - ISWS)

SUSPENDED-SEDIMENT SAMPLING TOWERS AS USED ON THE INTERTIDAL FLATS OF THE WASH, EASTERN ENGLAND,
Imperial Coll. of Science and Technology, London (England).
M. B. Collins.
Estuarine and Coastal Marine Science, Vol. 4, No. 1, p45-57, January 1976. 8 fig, 15 ref.

Descriptors: *Suspended solids, *Sampling, *Intertidal areas, Equipment, On-site data collections, On-site investigations, Sediments, Tides, Tidal waters, Estuaries, Coasts, Tidal marshes, Beaches.
Identifiers: *England(The Wash), *North Sea.

The design, construction and field application of systems for collecting samples of suspended material in tidal waters over an intertidal zone were described. Each sampler consisted of: a tower framework, sample containers for the water-sediment mixture, and a series of mechanical or electromechanical release mechanisms to control the instant of sampling (in relation to the tidal cycle). The suspended-sediment sampling systems were used over 40 tidal cycles across an intertidal flat in the Wash. The systems demonstrated that an extensive sampling program can be undertaken at low cost and using minimum manpower in the field. Mechanisms and sampling techniques described were considered to have broader applications in estuarine and oceanographic investigations. (Sims - ISWS)

Identifiers: *Danube River delta, *Hydrophytes, *Phytophilic invertebrates, Potamogeton-Pectinatus, Sparganium-Polyedrum, Trapa-Natans, Water chestnut, Pondweeds.

Data are presented on the distribution of higher hydrophytes in the Kilia Delta of the Danube, on the stock of higher hydrophytes in the Delta and on the biomass and stock of phytophilic invertebrates and benthos in the freshwater and brackish water zones of the delta. The aquatic vegetation of the Kilia Delta is diverse and is represented by plant associations belonging to 16 formations. The bur-reed Sparganium polyedrum associations occupy the greatest area among the groups of amphibious plants, the water chestnut Trapa natans among plants with floating leaves and the fennel pondweed Potamogeton pectinatus among the submerged plants.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: *Reproduction, Bass, Brackish water, Carp, Salinity, Fertility, Fish eggs.
Identifiers: Morone-Labrax.

Fertilizable eggs were obtained from 6 females, 1 of which treated with carp hypophysis, 2 hand-stripped after being kept in salt water for a brief period and the remaining 3 hand-stripped immediately after their capture in brackish water at low salinity. For the fertilization, sperm obtained from non-treated males was used. Although the percentage of fertility and hatching was generally low and the mortality high in the 1st days of post-larval development, a certain number of fry survived at present, after over 1 mo. from their hatching.--Copyright 1975, Biological Abstracts, Inc.

ECOLOGY OF THE OGUN RIVER ESTUARY, NIGERIA,
Ibadan Univ. (Nigeria). Dept. of Geology.
L. O. Asseez, E. A. Fayose, and M. E. Omatsola.
Palaeogeogr Palaeoclimatol Palaeoecol. 16(3), p 243-260, 1974.

Descriptors: Ecology, Estuaries, *Estuarine environment, *Distribution patterns, *Path of pollutants, Sediments, *Benthos, Africa.
Identifiers: Ammoastuta-salsa, Ammobaculites-crassus, Ammobaculites-dilatatus, Ammobaculites-exiguus, Ammonia-beccarii, *Foraminifera, Haplophragmoides-manilaensis, Haplophragmoides-wilberti, Miliammina-earlandi, Miliammina-fusca, *Nigeria(Ogun River Estuary), Trochammina-macrescens.

The distribution of benthonic communities (particularly Foraminifera) were studied from 14 samples obtained from the Ogun River estuary and environs. Ten species of benthonic Foraminifera were identified (Ammoastuta salsa, Ammobaculites crassus, A. dilatatus, A. exiguus, Ammonia beccarii, Haplophragmoides manilaensis, H. wilberti, Miliammina earlandi, M. fusca and Trochammina macrescens); 2 of these constitute over 90% of the total foraminiferal population. Two broad biofacies are recognizable, namely the upper estuarine facies of Ammobaculites and the lower estuarine facies comprising arenaceous and calcareous forms with a preponderance of Ammonia beccarii (L.). Large populations of few species occur in the lower estuary, an area of weakly saline water with marked salinity fluctuations. The upper estuary on the other hand is sparsely populated and contains tests mainly of arenaeous Foraminifera. A few species are distinctive of particular facies but some are distributed throughout the estuary. Substrate is not a causal ecological factor, because sediments are similar in physical attributes throughout the estuary. Salinity and rate of sedimentation are among the more important factors affecting the distribution of all species. The low-energy nature of the environment is established by the abundance of fecal pellets and the fragility of the tests of the arenaceous Foraminifera.--Copyright 1975, Biological Abstracts, Inc.

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

DESALINATION MATERIALS MANUAL,
Dow Chemical Co., Freeport, Tex.
P. F. George, J. A. Manning, Jr., and C. F. Schrieber.
OWRT/S--76/34 May 1975, 328 p, 104 fig, 56 tab, 51 ref.

Descriptors: *Desalination plants, *Corrosion control, *Water costs, Waste water treatment, Materials engineering, Desalination apparatus, Pre-treatment(Water), Metals, Materials, Alloys, Copper alloys, Aluminum alloys, Iron alloys, Stainless steel, Distillation.

Materials-related water costs could be reduced by a factor of 20% to 30% if knowledge is properly applied to the next generation of acid pretreated-distillation type desalination plants. Factors recognized as contributing to this reduction include recognition of: the critical importance of oxygen removal and pH control in the pretreatment process and the feasibility of satisfactorily controlling proper oxygen and pH levels through informed use of modern instrumentation. Higher priced, more corrosion resistant materials should be employed where conditions of remote geographical location or limited plant size make the use of sophisticated instrumentation impractical. Relatively low cost aluminum alloys may have applicability for heat transfer surfaces under proper design, water chemistry, and operational conditions. Modern instantaneous corrosion rate measuring instrumentation to monitor process operations for upsets creating corrosive conditions and taking corrective action when such corrosive conditions are found. Corrosion inhibitors can materially extend the life of metals and alloys in the desalination plant. Less than 1 ppm of iron reduces the corrosion rate of common copper alloys by 50% while pretreatment of aluminum alloys by boiling in deionized water can minimize pitting attack on aluminum exchanger tubing. Low level chromate-phosphate inhibitors, <0.1 ppm chromate, can substantially reduce both general and localized corrosion on steel, low alloy steel, copper alloys, and stainless steels.

ANALYSIS AND OPTIMIZATION OF A MULTI-EFFECT MULTI-STAGE FLASH DISTILLATION SYSTEM,
Kansas State Univ., Manhattan.
L. T. Fan.
OSW R and D Progress Report No. 355, May 1968. 14 p, 3 fig, 2 tab, 14 ref.

Descriptors: *Mathematical models, Desalination, Distillation, Flash distillation, Design, Heat balance.
Identifiers: *Multiple effect distillation, Distillation processes, Material balance.

A mathematical model of a multi-effect multi-stage flash distillation system that can be used in process optimization studies is developed. The model enables the heat input to the brine heater, the recycle flow rate in each effect, the concentration and temperature of the flashing brine leaving each effect, and the number of stages in each effect to be treated as variables in an optimization study. The model is believed to be accurate enough to describe the process, yet simple enough to be used in the simulation, design, and optimization of the process. (See also W70-04682) (OWRT)

Available from the National Technical Information Service, Springfield, Va 22161 as PB-252 597, $16.25 in paper copy, $2.25 in microfiche. OWRT/S--76/36, November 1975. 632 p, 59 fig, 90 tab, 40 ref, 24 append. 14-30-3233.

Descriptors: Desalination, *Desalination processes, *Membrane processes, *Reverse osmosis, Sea water, *Pilot plants, Desalination plants.
Identifiers: Polyamide hydrazide membranes, Polyamide hollow fiber permeators, Spiral wound modules, Pretreatment, Fouling control, Cost estimates.

Sea water desalting through continued development and testing of the polyamide hydrazide (DP-1) film membrane in a spiral configuration is described. Results of testing of polyamide hollow fiber permeators operating at 800 psi and desalting sea water in a single stage are also discussed. A process to continuously cast assymetric DP-1 film membranes of up to 36 inches width was developed to supply membranes for fabrication of spiral module elements. Small spiral (2 in.) elements desalted seawater at expected flux and rejection levels and maintained stable performance in the field. Most larger (4 in.) elements lost salt rejection rapidly as a result of inadequate flatness of the membrane support (sailcloth) and of wrinkles in the spirally wound leaves. Leads to overcome these deficiencies through use of alternate materials and improved fabrication techniques were demonstrated. Prototype polyamide hollow fiber permeators of 8 in. diameter with fiber-glass reinforced epoxy shells were fabricated. Field tests of 4 in. and 8 in. permeators culminated in the operation of a pilot plant producing 10,000 gpd potable water at Ocean City, New Jersey. System design, pretreatment, operating methods and cleaning procedures to control fouling of the permeators in live sea water are discussed. (OWRT)

FINAL REPORT (DEC 74-JULY 75) PILOT PLANT OPERATIONS, ROSWELL TEST FACILITY, ROSWELL, NEW MEXICO.
Burns and Roe, Inc., Paramus, N. J.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-252 638, $7.50 in paper copy, $2.25 in microfiche. OWRT/S--76/35, (1975). 173 p, 29 fig, 42 tab. 14-30-3296.

Descriptors: *Desalination plants, *Desalination processes, *Membrane processes, *Membranes, *Pilot plants, Reverse osmosis, Brackish water, New Mexico, Operation and maintenance.
Identifiers: Spiral wound membranes, High product recovery, Thin film composite membranes.

Results are presented of operation, maintenance, and development activities associated with testing of several brackish water membrane desalting pilot plants at the OWRT Roswell Test Facility, Roswell, New Mexico during the period December, 1974 through July, 1975. Evaluation tests were conducted with several reverse osmosis pilot units ranging in capacity from 100 gpd to 90,000 gpd. Major testing programs included continued evaluation of a multi-stage high product recovery pilot plant employing three reverse osmosis stages in series and capable of attaining 90 percent recovery. In addition, test results obtained with experimental thin film composite PA-100 and PA-300 membranes in a spiral wound configuration are described. (OWRT)

INSTRUMENTATION GUIDE FOR SEAWATER DISTILLATION PLANTS,
Oak Ridge National Lab., Tenn.
R. P. Hammond.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-252 693, $7.75 in paper copy, $2.25 in microfiche. OWRT/S--76/28, October 1972. 140 p, 48 fig, 15 tab, 61 ref, append. DoI 14-30-2535.

Descriptors: *Instrumentation, Flash distillation, Evaporators, *Desalination plants, *Distillation.
Identifiers: *Instruments manual.

This manual is intended to guide the application of generally available instrumentation to Multistage Flash and Vertical Tube Evaporator types of desalting plants and to serve as a guide to detailed information on specific instruments. It assumes that the instrumentation designer has working knowledge concerning construction and operation of evaporator plants, and competent knowledge of process instrumentation used in these plants. Basic information is presented by means of brief discussions of the advantages and limitations of instrumentation components used in desalting plants. Practical information is presented by means of specific recommendations where appropriate. It is expected that this manual will be of value to an instrument engineer who has little experience with process instrumentation and no experience with distillation plants. It will be necessary for the user of this guide to gain a reasonable knowledge of distillation plant construction and operation. In all cases the information is restricted to the ranges of parameters (temperatures, pressures, etc.) expected to be encountered in desalting evaporators, and does not extend into application of technology above or below these ranges.

HEAT EXCHANGERS AND EVAPORATORS,
Austral-Erwin Engineering Co., Houston, Tex. (Assignee).
R. W. Erwin.
U.S. Patent No. 3,939,036, 8 p, 2 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 943, No 3, p 1334, February 17, 1976.

Descriptors: *Patents, Water purification, *Desalination, *Evaporation, *Demineralization, Separation techniques, *Heat exchangers, Desalination apparatus, Descaling, Oily water, *Evaporators.

A method of evaporating an aqueous feed solution containing dissolved solids or mineral salts and separating the resulting product into individual compontents without adherence of the solids or mineral salts to any surfaces contacting the aqueous solution is described. The method is carried out in an evaporating and separating apparatus which comprises an evaporating chamber including a confined heating and vaporizing zone having heating elements and succeeding separating chambers or zones separate from the evaporating chamber. The succeeding chambers or zones include separating zones for misty vapors, oily foam, hot oil, oily aqueous solution, and oily aqueous folution solids-slurry. All contacting surfaces of the evaporating and separating apparatus are formed of oil wettable material and all contacting surfaces of the evaporating chamber are formed of substantially zero water adsorbent polymeric fluorocarbon material. The aqueous solution as a continuous medium mixed with sufficient dispersed oil to form a continuous film of oil on all oil wettable contacting surfaces flows upwardly through the confined heating and vaporizing zone and contacts the heating elements, the surfaces of which are substantially zero water adsorbent and totally wetted with a film of oil. A portion of the aqueous solution is converted to water vapor and precipitated solids, thus forming a mixture comprising hot oil, misty vapors, solids, and the remaining aqueous solution. The mixture is then separated into components in succeeding separating zones or chambers. (Sinha-OEIS)
W76-07433

APPARATUS FOR CONTROL OF A REVERSE OSMOSIS SYSTEM,
Desalination Systems, Inc., Escondido, Calif. (Assignee).
D. T. Bray.
U.S. Patent No. 3,939,074, 4 p, 3 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 943, No 3, p 1345, February 17, 1976.

Descriptors: *Patents, Water purification, *Waste water treatment, Water quality control, *Reverse osmosis, *Membrane processes, Semipermeable membranes, Separation techniques, Water storage, Storage tanks, Hydraulic properties, Valves.

The reverse osmosis system comprises a module containing a semipermeable membrane, a pipe for introducing feed water under elevated pressure into the module, a restrictor or pressure control valve for releasing brine from the module while retaining operating pressure, and a tank for temporarily storing purified water. A valve is provided in the pipe introducing feed water into the module and the pipe transferring purified water from the module to the storage tank. This valve is actuated by means outside the tank for shutting off or turning on introduction of feed water into the module, and thus indirectly transfer of purified water into the storage tank, in response to the amount of purified water in the storage tank. The weight of water in the storage tank is employed for determining the amount, to automatically control actuation of the feed water input valve, or the purified water transfer valve, to maintain a predetermined amount of purified water in the storage tank. Hydraulic head is commonly considered to be a column height producing a pressure or weight of a liquid exerted over a unit area. The means for actuating the valve that controls the feed water input to, or the purified water transfer from the module, dependent on the weight of purified water in the storage tank, is completely outside the storage tank itself. (Sinha-OEIS)
W76-07440

METHOD FOR CLEANING SEMIPERMEABLE MEMBRANES,
Desalination Systems, Inc., Escondito, Calif. (Assignee).
C. C. Macevicz, and C. W. Million.
U.S. Patent No. 3,940,336, 4 p, 2 ref; Official Gazette of the United States Patent Office, Vol 943, No 4, p 1809, February 24, 1976.

Descriptors: *Patents, *Water purification, *Reverse osmoses, *Semipermeable membranes, *Membrane processes, *Desalination, Demineralization, Water quality control, Ion exchange, Resins, Resistivity.
Identifiers: Ultrapure water.

The invention comprises a method for cleaning a semipermeable membrane in a membrane process solution treatment system, in which a surface of such a membrane is cleaned by flushing with ultrapure water, that is water of purity greater than one megohm resistivity, and preferably between about one megohm and about 18 megohms resistivity. Preferably, the surface of a semipermeable membrane is flushed with water of purity greater than one megohm resistivity at a rate between about one-tenth gallon and about ten gallons per hour of water per square foot of membrane area. The flushing time should extend over a period of between about one and about fifteen hours. The membrane is maintained in place in its working assembly such as a cartridge or module, during cleaning. The water of purity greater than one megohm resistivity is produced by deionization of water containing a substantial content of total dissolved solids with an apparatus using ion exchange resin beds or mixed resin beds. (Sinha-OEIS)

3B. Water Yield Improvement

SHALE CHISELING-EFFECT ON WATER YIELD,
Virginia Polytechnic Inst., and State Univ., Blacksburg. Dept. of Agricultural Engineering.
V. O. Shanholtz, J. B. Burford, and E. T. Engram.
Transactions of the American Society of Agricultural Engineers, Vol. 18, No. 6, p 1100-1104, November-December 1975. 6 fig, 1 tab, 21 ref.

Descriptors: *Chiselling, *Soils, *Water yield, *West Virginia, Shales, Hardpan, Dikes, Subsoil, Runoff, Watersheds(Basins), Calibrations, Pastures, Soil profiles, Precipitation(Atmospheric), Earth dikes.
Identifiers: *Shallow soils, *Shale chiselling, Subsoiling, Linear regression.

Four small watersheds were instrumented to study the effect of chiselling shallow shale soils on water yields. Analysis of monthly water yield data indicated that chiselling reduced water yield by a small but statistically significant amount. Surface flows were reduced as shown from an analysis of selected storm events. However, an analysis of the total flow from the same events showed little change in flow, which strongly suggested that the reduction in surface flow was compensated by increased subsurface movement. The small decrease in water yield which was shown by analysis of the monthly yield data was strongly associated with snow melt. Approximately 77% of the reduction was traced to periods of high snowmelt. No significant change was noted during the summer months when it would have the most agronomic importance. (Roberts - ISWS)

3C. Use Of Water Of Impaired Quality

ACIDITY, ACID SULPHATE SOILS AND LIMING OF PADI FIELDS,
K. Kanapathy.
Malays Agric J. 49(2), p 154-165, 1973.

Descriptors: *Sulfates, *Acidic soils, Hydrogen sulfide, *Saturated soils, *Lime, Fertilizer, *Soil treatment, Application rates, Cultivation, Acidity.
Identifiers: Padi fields.

In order to understand the effect of liming and waterlogging of acid sulfate soils as well as other soils several experiments were carried out. Padi could tolerate acidity to a high degree if Fe and Al were not present in large quantity. H2S had deterimental effects on padi. Water logging decreased acidity of the soil/water. Peaty soils could be more heavily limed than silty soils. The addition of basic substances made soil N more available. The type of cultivation and period of water logging would have great influence on the response of padi to liming on an acid sulfate soil. Liming of acid padi fields would therefore be only an insurance against lack of water. It is recommended that liming be done to bring the soil up to a pH of 4.2 after ascertaining the pH. Most acid sulfate soils give low yields inspite of lime and fertilizer.--Copyright 1975, Biological Abstracts, Inc.

SALT-TOLERANT SILT GRASS (PASPALUM VAGINATUM SW.),
Miami Univ., Coral Gables, Fla.
J. F. Morton.
Proc Fla State Hortic Soc. 86, p 482-490, 1973(1974).

Descriptors: *Grasses, Turf grasses, *Salt marshes, Marshes, *Brackish water, *Saline water, *Irrigation water, *Tropical regions.
Identifiers: Fodder grass, Paspalum-vaginatum, *Salt grass.

Silt grass occurs naturally on muddy seacoasts, in tidal marshes and brackish sandy regions of both hemispheres from Baja California, North Carolina and southern Spain southward. Erect or prostrate in habit, it has a tough, creeping rootstock and forms dense mats. It has been successfully domesticated in Australia, southern Florida and the West Indies and has been introduced into cultivation in Venezuela. Easy to propagate and fast-growing, it makes excellent turf and is an ideal lawn grass for subtropical and tropical areas where irrigation water has an unfavorable salt content. In coastal pastures, it provides nourishing fodder. The dried grass is employed as a tropical American folk remedy.--Copyright 1974, Biological Abstracts, Inc.

Identifiers: *Water consumption, Regional planning, Systems engineering, Urban planning.

Governmental decision making in metropolitan areas is becoming increasingly concerned with finding comprehensive solutions to area-wide problems. Development of an adequate urban water supply system is such a problem. Although the price, cost and quality of water supply offered by various civil subdivisions in a given metropolitan area may be widely divergent, the factors influencing this service are similar. This paper examines the costs associated with supplying drinking water to consumers, the factors affecting the price of water, and the elasticity of consumer demand based on the prices that they must pay. The cost analysis explores the costs by functional area and the costs of transporting water to the consumer. Factors that affect the price of water such as population density are examined, and the reaction of the consumer to increases in price levels is established. (Bell-Cornell)

Identifiers: *Coastal areas, Water flow, Master plan.

Traditional development in South Florida has in many cases resulted in undesirable degradation of terrestrial and aquatic ecosystems, due to overdrainage and overenrichment of surface waters. A study was undertaken in order to establish guidelines under which urban development may take place in coastal areas, while minimizing unwanted environmental changes. The study area consists of approximately 70 square miles of relatively flat land in Collier County, Florida. The coastal wetlands of the region are a highly valued natural resource containing the Rookery Bay Wildlife Sanctuary. The upland properties are mainly pine woodlands and have great potential for development. A master plan was developed which will: (1) provide adequate drainage for existing and projected development within the study area; and (2) maintain the integrity of the estuarine zone. The major recommendations of the plan relate to land use, physical control of surface waters, including construction and maintenance of the water management system, and implementation of the plan. FISHERIES IMPLICATIONS OF WATER TRANSFERS BETWEEN CATCHMENTS,
Association of River Authorities (England). MAFF Hydrological Group.
L. G. de Solbe.
Proceedings of the Institution of Civil Engineers, Part 1, Vol. 58, p. 699-700, 1975.

Descriptors: *Fisheries, *Water transfer, *River basins, *Fish diseases, Water temperature, Spawning, Water pollution, Fish population, Salmonids, Fish food organisms, Algae, Fish management, Fish migration, Stream improvement, Flow rates, Europe.
Identifiers: England.

For organisms to remain in balance with their environment, changes in water transfer rates must occur slowly. Effects of pH, hardness, and tem-

perature should be minimal and badly polluted or infected water donors should not be used. Transferred water may contain fish, fry, or eggs which might be predators. Introduction of fishfood organisms could be beneficial, but algae might produce blooms. Transfer might also affect the odor (pherones) of young salmon and affect migration to the salmon's natal river. Intermittent transfers can endanger spawning grounds and severely reduce production. To combat this, transfer flow and velocity might have to be continuous or fish should be prevented from entering danger areas. Engineering work on recipient channels should consider the needs of fish (variety of gradient and depth, bank and aquatic vegetation, food and cover) so that water transfers could benefit fisheries. Optimum flows for angling and fish migration are discussed. Electronic fish counters are being installed to provide data on fish movements. Research is needed on creating freshets or continuing flow with stored water. Improvement of transfer channels so that they would be suitable for fish and development of fisheries is discussed. AHTANUM INDIAN IRRIGATION PROJECT.
Bureau of Indian Affairs, Washington, D. C.
Federal Register, Vol. 39, No. 203, p. 37199 (1974). 1 p.

Descriptors: *Washington, *Maintenance costs, *Water costs, *Indian reservations, *Irrigated land, Irrigation operation and maintenance, Irrigation systems, Irrigation water, Irrigation districts, *Irrigation programs, Federal government, Administrative agencies, Water management(Applied), Operation and maintenance, Operating costs, Operations, Irrigation water, Water distribution(Applied).
Identifiers: *Yakima Indian Reservation(Wash), Ahtanum Indian Irrigation Project(Wash).

The Bureau of Indian Affairs under the authority delegated by the Secretary of the Interior has proposed to change the rate for annual operation and maintenance assessments on the Ahtanum Indian Irrigation Project. The purpose of this modification is to increase the assessment rate to reflect more accurately the actual operation and maintenance costs as reflected by the previous year's operating experience and the anticipated program of work. The operation and maintenance charges of the project, located upon the Yakima Indian Reservation, are fixed at $4.00 per acre per annum for each irrigable acre of land to which water can be delivered from the project works. (Welch-Florida)

INCREASED WATER USE EFFICIENCY THROUGH TRICKLE IRRIGATION,
Texas A and M Univ., College Station. Dept. of Agricultural Engineering.
E. A. Hiler.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-252 188, $5.00 in paper copy, $2.25 in microfiche. Texas Water Resources Institute, College Station, Technical Report No. 65, June 1975, 72 p. 20 ref, 7 append. OWATB-167-TEX(1). 14-31-0001-4144.

Descriptors: Irrigation, Design, Computer models, *Water utilization, *Irrigation efficiency, Crop response, *Application methods, Computer programs, Water requirements, Water loss.
Identifiers: *Trickle irrigation, Water use efficiency, *Optimum irrigation timing.

Experiments were conducted in a well-instrumented field lysimeter installation to determine optimum irrigation timing and application amounts for best water use efficiencis using trickle irrigation. A Comparison of water use efficiencies under well-watered conditions using intensified and conventional water application methods showed higher water use efficiencies and better crop response when the trickle method was used. Also, the results showed that higher water use ficiencies can be obtained by applying sparing amounts. A computer model was developed to simulate grain sorghum yield and water use under high frequency irrigation. This method can be used to simulate a complete irrigation experiment greatly reducing research costs and allowing the determination of water requirements for many crops under many different soil and climatic conditions. Using the results of the experimental studies as design inputs, two trickle irrigation lateral design methods were developed. With the first method, a computer program was developed to determine lateral pressure loss and emitter flow ratio at a given design length as a function of several pertinent design varibles. In the second method, design equations are utilized to calculate the maximum lateral length for a given uniformity of application coefficient. Dimensionless graphs were developed that can be used to properly design the trickle irrigation laterals.

EVALUATION OF ALTERNATIVE USES OF WETLANDS,
North Dakota State Univ., Fargo. Dept. of Zoology.
J. F. Cassel.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-252 192, $3.50 in paper copy, $2.25 in microfiche. North Dakota Water Resources Research Institute, Fargo, Completion Report No. WI-221-032-75, November, 1975, 11 p, 1 fig, 2 tab, 10 ref. OWRT-A-039-NDAK(1). 14-31-0001-4034.

Descriptors: *Wetlands, *North Dakota, *Waterfowl, Alternative water use, Evaluation, Wheat, Pintail duck, Crops, Grain(Crops), Feeds, Barley, Mallard duck.
Identifiers: J. Clark Sayler National Wildlife Refuge,(N DAK), Crop degradation, *Feeding behavior (Waterfowl)

Field feeding and depredation by waterfowl were observed in Bottineau County, North Dakota from October 2 to October 14, 1974, in order to provide a general overview of the depredation problem. Estimates indicated that 18 percent of the crop remained to be harvested and that durum wheat and barley made up most of the unharvested grain. Waterfowl populations, concentrated mostly on J. Clark Salyer National Wildlife Refuge, consisted of 50,000 to 60,000 ducks and 33,000 geese. Mallards and Pintails were the only species observed feeding on unharvested grain. Durum and barley appeared to be the most highly preferred grain type and stubble and swathed field the most commonly utilized field type. The major portion of losses appeared to be by trampling of swaths and grain shaken from heads and usually involved small flocks and small portions of damaged field. Most field feeding occurred in early morning and late afternoon. Scaring methods of depredation control were used most commonly during the study period but the feeding program at Salyer Refuge was not in operation at this time. It is suggested that the feeding program at Salyer be extended, the hunting season be opened early during times of severe depredation, local growers be informed of control techniques available and the biology of field feeding waterfowl be further investigated.

Descriptors: *Proteins, *Corn(Field), *Soil moisture, Leaves, Cytological studies, Metabolism, Enzymes.
Identifiers: Cytoplasmic proteins.

Lack of plant water at all main phenological stages results in the weakening of high-molecular weight protein synthesis and thus decreases enzyme activity. Simultaneously a part of low-molecular proteins increases which might be due to depression of the high-molecular weight protein synthesis as well as due to intensification of high-molecular weight substance decomposition in the aging leaves. All of these affect plant productivity.--Copyright 1974, Biological Abstracts, Inc.

USE OF COVER CROPS IN ORCHARDS IN CONNECTION WITH THE PROBLEM OF WATER ACCUMULATION IN SOILS, (IN RUSSIAN),
Leningrad State Univ. (USSR).
R. S. Ryabykh.
Vestin Leningr Univ Ser Biol. 28(3), p 113-117, 1973

Descriptors: Crops, *Cover crops, Orchards, Soils, *Soil moisture, *Moisture content, *Apples, Fruit crops, Nitrates, Seasonal, Fertility.

When moisture conditions are insufficient, the summer sowing of the spring cover crops in orchards (recommended by agrotechnical methods) results in very little green mass whereby drying of the soil takes place. The winter cover crops use the moisture of the autumn-winter and early spring precipitation formed during half of the year. These atmospheric precipitations insure the building of a great amount of green mass, without damage to the water conditions of the fruit trees. The green mass is mixed with the soil 10-12 cm deep, before flowering apple trees preserve the water and increase the content of nitrate in the soil during the whole vegetative season. It stimulates the growth and fruitfulness of the trees. If the green mass is ploughed 18-20 cm deep, the effect of the cover crop is lowered.--Copyright 1974, Biological Abstracts, Inc.

PUDDLING AGAINST DRY PLOWING FOR LOWLAND RICE CULTURE IN SURINAM: EFFECT ON SOIL AND PLANT, AND INTERACTIONS WITH IRRIGATION AND NITROGEN DRESSING,
Agricultural Univ., Wageningen (Netherlands). Dept. of Tropical Soil Sciences.
W. Scheltema.
Versl Landbouwkd Onderz (Agric Res Rep). 828, p 1-241, 1974.

Descriptors: *Rice, *Farm management, Clays, Soils, Fertilizers, Nitrogen, Potassium, *Cultivation, Iron, Dehydration, Crop production.
Identifiers: Plowing, *Puddling, *Surinam.

The influence of tillage on rice grown on heavy Surinam clay soils was investigated in pot and field trials. Included were interactions with seed rate, N dressing and distribution, water management and variety. Four procedures for tilled layer and seedbed preparation were studied morphologically, physically and chemically: wet, dry/wet, dry and zero. Differences between tillage treatments were found in sedimented layers, fragmentation, moisture contents, bulk density, dehydration curves, amount of moisture extracted by suction, permeability, moisture potentials, structural stability, content of extractable ammonium and Fe and K concentrations in soil moisture. Plant growth and grain yield were influenced by tillage through seedling establishment and growth, N mineralization in the soil, recovery of applied N in the rice plant, total amount of applied N and its distribution, surface drainage and mutual shading. Shaddow tillage, a few times in tilled layer preparation and a large wooden beam in seedbed preparation gave highest yields. The effect of the easiest procedures-dry and dry/wet tillage-depended on the weather during the operation. The customary dry/wet tillage seemed harmful as it induced mutual shading thus reducing grain yield. Dry tillage was most beneficial to grain yield because of the high recovery of applied N. Wet tillage should be performed only when weather is unfavorable. Zero tillage is practicable, but weed control is troublesome.--Copyright 1975, Biological Abstracts, Inc.

AFTEREFFECT OF SPRING FROSTS ON PROTEIN SYNTHESIS IN WINTER WHEAT LEAVES DEPENDING ON THE FORM OF NITROGENOUS FERTILIZER, (IN RUSSIAN),
Siberian Inst. of Plant Physiology and Biochemistry, Irkutsk (USSR).
A. K. Glyan'ko, and N. V. Mironova.
Fiziol Biokhim Kul't Rast. 6(2), p 180-182, 1974.

Descriptors: Frost, Protein, *Wheat, *Leaves, Nitrogen, Fertilizers, Nitrates, Ureas.
Identifiers: Nitrogen-15, Winter wheat, Nitrate-Ammonium, Nitrogen-nitrate.

Experiments with winter wheat showed that weak (-4, -5C) and severe (-9, -10C) frosts have an inhibitory effect (3 days later) on incorporation of N15 into ethanol-insoluble fraction (EIF) of leaves with plant N-NH4 nutrition. When dressing with urea, incorporation of N15 into EIF is inhibited only during severe frosts and remains unchanged during weak ones. When N-NO3 nutrition is applied to the plants incorporation of N15 is more active during weak frosts and is unchanged during severe ones.--Copyright 1975, Biological Abstracts, Inc.

POP-UP SPRINKLER HEAD HAVING FLOW ADJUSTMENT MEANS,
Toro Co., San Marcos, Calif. (Assignee).
E. J. Hunter.
U.S. Patent No. 3,940,066, 5 p, 16 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 943, No 4, p 1724, February 24, 1976.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation efficiency, Irrigation practices, Flow, Regulated flow, Equipment, Water pressure.
Identifiers: Pop-up sprinkler.

A pressure control device for an irrigation nozzle has a rotatable riser and a nonrotatable valve for regulating the flow and pressure of water through the sprinkler. The riser is sealed at the water inlet end by a suitable plug and a valve ring is snug-fit on the riser. The valve ring is keyed to a filter screen surrounding the riser to remain circumferentially stationary. The valve ring has an orifice which is congruent to the inlet orifice in the riser. The pressure to the entire sprinkler system is adjusted by rotating the riser either manually or by any suitable means. This provides for adjustment of the flow of water through the orifice in the valve ring and then through the inlet orifice in the riser. In an alternative embodiment, a valve disc is secured to the inlet end of the riser and is circumferentially stationary with respect to the riser. The riser has a plug mounted at the inlet end and a key or splined stop on the surrounding filter keys the plug and riser to permit limited rotation. Both the valve disc and the riser have orifices with are congruent. Rotation of the riser with respect to the stationary valve disc regulates the flow of water. (Sinha-OEIS)

SPECIAL FLOOD HAZARD INFORMATION REPORT ON SHINGLE CREEK, OSCEOLA AND ORANGE COUNTIES, FLORIDA.
Army Engineer District, Jacksonville, Fla.
Prepared for the Boards of County Commissioners of Osceola and Orange Counties, January 1970. 7 p, 5 plates, 1 tab.

Descriptors: *Floods, *Flood plains, *Historic floods, *Flood flows, *Flood profiles, Runoff, Storms, Hurricanes, Flood data, Flood frequency, Peak discharge, Channel improvement, *Florida.
Identifiers: Osceola County(FL), Orange County(FL), Orlando(FL). Kissimee(FL), Shingle Creek(FL), Clear Lake(FL), Lake Tohopekaliga(FL), Standard Project Flood, Intermediate Regional Flood.

Shingle Creek, in Orange County, Florida, flows from its headwater at Clear Lake to its mouth at Lake Tohopekaliga just below Kissimmee and drains an area of 180 square miles. Only the eastern haf of the basin drained by the 11.59 mile long main stem of Shingle Creek is considered in this report. Part of the City of Orlando is in the northern section of the basin. Consequently, the flood plain contains urban development in this northern section. Other non-agricultural development is centered around Kissimmee. The rest of the area is largely undeveloped or in agricultural uses (pastures and citrus groves). Flooding can occur as the result of prolonged seasonal rainfall and tropical hurricanes. The discharge capacity of Shingle Creek is inadequate to handle even the runoff from a moderate storm, and some flooding occurs almost yearly. Since 1945, 10 damaging floods have occurred with the worst occurring in March 1960 when flood elevations recorded 71.66 feet above mean sea level, or 5.7 feet above average flood stage. Peak discharge reached 3,320 cubic feet per second and homes and streets were inundated. The estimated frequency of this flood stage occurring is once in 25 years. 'Under 1960 land useconditions, 800 acres of urban development, 3,000 acres of improved pastures, and 100 acres of citrus groves are subject to flooding.' Estimated flood profiles for the Intermediate Regional Flood and Standard Project Flood are given. Population projections indicate that Orange County is expected to increase from its present population of about 360,000 to 470,000 by 1980 and 575,000 by 1990. Osceola County is expected to increase from the present 31,500 to 64,700 by 1990. (Henley - North Carolina)
W76-06914

FLOOD PLAIN INFORMATION: COASTAL AREAS, MARTIN COUNTY, FLORIDA.
Army Engineer District, Jacksonville, Fla.
Prepared for the Board of County Commissioners of Martin County, June 1973. 30p, 14 plates, 8 fig, 4 tab.

Descriptors: Floods, *Tidal waters, Tides, *HUrricanes, *Flood plains, *Non-structural alternatives, *Flood profiles, Waves, Flood plain zoning, Peak elevation, Historic floods, Flood frequency, Flood plain damage, Warning systems, Building Codes, Shores, Flooding, Storms, *Florida.
Identifiers: Tidal flooding, Wave runup, Martin County(FL). Atlantic Ocean, Stuart(FL), St. Lucie River(FL), Indian River(FL), Intracoastal Waterway(FL), Standard Project Tidal Flood, Standard Project Hurricane, Intermediate Regional Tidal Flood, Intermediate Regional Hurricane.

The coastal portion of Martin County (1970 population 28,035) is subject to tidal flooding from hurricanes and tropical storms and to freshwater floods due to intense rainfall. This report id devoted exclusively to discussion of tidal flooding which can occur from June to November as the result of hurricanes and tropical storms. Tidal floods are generally more damaging than freshwater floods due to the action of waves and the corrosive properties of salt water. Five damaging tidal floods have occurred since 1928; one in September 1949 did $4 million damage to Martin County. A high water mark of 8.5 feet was reported near Stuart and of 160 mph winds were reported. The Intermediate Regional Hurricane would typically have winds reaching 108 mph and a minimum central pressure of 27.3 inches. The Intermediate Regional Tidal Flood would have a peak elevation of 7 ft above mean sea level in the Indian and St. Lucie Rivers and would have runups of up to 12 ft above sea level on beaches with moderately steep slopes. The Standard Project Hurricane would have winds reaching 113 mph and a minimum central pressure of 26.9 inches. The Standard Project Tidal Flood would have a peak elevation of 8 ft msl in the Indian and St. Lucie Rivers and runups of up to 12 ft msl. The SPF and the IRF would flood 4,500 and 4,000 built-up acres respectively. Flood plains on Hutvchinson and Jupiter Islands currently are sparsely developed; flood plains on the mainland in the vicinity of Stuart are well developed and development is increasing at a rapid rate. Martin County currently has zoning ordinances, building codes, and other regulatory measures adopted for reduction of flood damages. (Henley - North Carolina)
W76-06915

SPECIAL FLOOD HAZARD INFORMATION: VERNONBURG, GEORGIA.
Army Engineer District, Savannah, Ga.
Prepared for the City of Vernonburg, January 1972. 6 p, 3 plates.

Descriptors: *Floods, *Hurricanes, *Tides, Winds, *Tidal waters, Flood frequency, Flood peak, Erosion, Flood plains, Flood protection, Flood plain zoning, Floodproofing, *Georgia.
Identifiers: Flood plain management, Intermediate Regional Flood Tide, Standard Project Flood Tide, *Vernon River(GA).

Vernonburg, a residential community of 136 located 8 mi south of Savannah on the Vernon River, is subject to frontal assault from hurricane wind and erosion caused by high velocity wave action. The area is subject to tidal surges, since the town is only 21 ft above mean sealevel at maximum. Historic large floods have occured here though little data on tidal heights exists. A storm in 1893 had a height of 17 ft above mean sea level. During hurricanes or tropical storms having a magnitude of Intermediate Regional Flood Tide homes and streets located adjacent to marshes in the area would be subject to severe damage. Statistical studies using records of hurricanes and tide gaging stations indicate that Intermediate Regional Flood Tide will average 5.5 ft less than the 1893 flood. A Standard Project Flood Tide would be only slightly larger than the 1893 flood with tidal elevation estimated at about 17 ft msl. It is recommended that appropriate regulations be adopted to guide development in flood-prone areas. (Smith - North Carolina)
W76-06916

FLOOD PLAIN INFORMATION: HOCKANUM RIVER, VERNON, CONNECTICUT, TECHNICAL REPORT.
Buck and Buck, Hartford, Conn.
Prepared for New England Division, Army Corps of Engineers, Waltham, Mass. June 1966. 30 p, 22 fig, 10 plates.

Descriptors: Floods, *Flood plains, *Flood profiles, *Flood stages, *Flood forecasting, Storms, Historic floods, Flood frequency, Flood damage, Flood protection, Warning systems, Non-structural alternatives, Flood proofing, *Connecticut.
Identifiers: *Hockanum River(CN), Vernon(CN), *Shenipsit Lake(CN), Tankerhoosen River(CN), Ogden Brook(CN), Standard Project Flood, Manchester(CN), Talcottsville(CN), Ellington(CN).

The Hockanum River (drainage area 48 sq mi) enters the town of Vernon at its northeast corner at the foot of Shenipsit Lake (drainage area 16.5 sq mi) and has a total reach length in Vernon of approximately 5 miles. The available storage in Shenipsit Lake at the time of severe storms has a tremendous effect on flooding along Hockanum River. The Tankerhoosen River and Ogden Brook, both tributaries of the Hockanum River, are susceptible to flash flooding. The flood plains of the Hockanum, with a minimum width of 150 ft, are relatively undeveloped and contain a few buildings, including some commercial buildings at Manchester town line. A few residences are within the Standard Project Flood limits. Flood flows can be obstructed by bridges, culverts, and vegetation. The only flood on record doing appreciable damage occurred in September 1938, and had a peak discharge of 5,160 cubic ft/sec at the East Hartford Gaging Station. This flood, the result of hurricane rains of 14.7 inches in a 4 day period, has a 1% chance of occurrence in any year. By comparison, the SPF would have a peak discharge of 7,150 cfs. Flood profiles are developed using Benson's equation for peak discharge. Though the Vernon Fire District Planning Commission uses subdivision regulations to control flood plain development, this report suggests extensive guidelines and controls for reducing flood damages which include controlling the filling of the flood plain, encroachment limits, flood plain zoning, flood proofing, and channel maintenance. (Henley - North Carolina)
W76-06917

FLOOD PLAIN INFORMATION: CACHE LA POUDRE RIVER, COLORADO, VOLUME I, FORT COLLINS, LARIMER COUNTY.
Army Engineer District, Omaha, Nebr.
Prepared for Larimer-Weld Regional Planning Commission, October 1973. 25 p, 14 fig, 15 plates, 5 tab.

Descriptors: Floods, *Flood flow, *Flood plains, *Flood profiles, *Snowmelt, *Flood forecasting,

Runoff, Storms, Historic floods, Flood stages, Flow duration, Flow characteristics, Flood damage, *Colorado.
Identifiers: *Cache La Poudre River(CO), Dry Creek(CO), Fort Collins(CO), Larimer County(CO), Spring Creek(CO), Laporte(CO), Standard Project Flood, Intermediate Regional Flood.

This study reach of Cache La Poudre River in Larimer County extends 15.4 miles from a point near the river gage upstream of Laporte to the Spring Creek confluence at Fort Collins. The river in this reach drains an area of 1,055 sq mi and has a slope of 16 ft/mi. The flood plain is not extensively developed; much of the included area could be utilized for safe use. Fort Collins has acquired some flood prone lands for use as open space areas. Continued growth of Fort Collins (population 51,125) is expected to bring development pressure to the flood plains. Presently, thirteen bridges, roadway embankments, residential and commercial structures can obstruct flood flows. Flooding can occur from May through September as the result of intense rainfall. Flooding is most likely to occur in June when rainfall and snowmelt runoff combine to produce flood flows. The river through Fort Collins begins to exceed channel capacity at a peak discharge of about 5,000 cubic feet per second. The Intermediate Regional Flood and the Standard Project Flood would have peak discharges of 19,700 and 60,000 cfs respectively, at the downstream limit of study reach, and would subject residential, commercial, utility and public property to flooding. At Fort Collins peaking will normally occur due to heavy rainfall in about 6 hours with 30 hour duration. Below Watson Lake where the flood plain is relatively narrow and velocities are high overbank flows will be dangerous. A major flood last occurred in 1904. (Henley - North Carolina)
W76-06918

FLOOD PLAIN INFORMATION: NAUGATUCK RIVER, ANSONIA, SEYMOUR, BEACON FALLS, NAUGATUCK, WATERBURY, WATERTOWN AND THOMASTON, CONNECTICUT.
Army Engineer District, Waltham, Mass.
June 1973. 36 p, 20 fig, 12 plates, 5 tab.

Descriptors: *Flood plains, *Flood flows, *Dams, *Flood profiles, *Flood data, *Flow characteristics, *Flash floods, Flood stages, Historic floods, Runoff, Storms, Erosion, Channel, Warning system, Flow duration, *Connecticut.
Identifiers: *Naugatuck River(CN), Beacon Falls(CN), Naugatuck(CN), Waterbury(CN), Watertown(CN), Thomaston(CN), East Branch Naugatuck River(CN), Standard Project Flood, Intermediate Regional Flood.

Portions of the city of Waterbury, largest community in the watershed with a population of 108,033, and the towns of Ansonia, Seymour, Beacon Falls, Naugatuck, Watertown, Thomaston, Connecticut, are subject to flooding from the Naugatuck River (reach length of 50 miles, drainage area of 312 sq mi) and its tributaries, the East and West Branches of the Naugatuck River, Leadmine Brook, Branch Brook, Hancock Brook, Steel Brook, Mad River, Hop Brook, Bladens River and Little River. Significant industrial and residential development in Waterbury, Ansonia, and Naugatuck are subject to flooding. Flood plain open spaces may come under pressure for future development. Connecticut has established channel encroachment lines along the Naugatuck River. None of the towns in the study area have regulatory measures specifically for flood reduction. Flooding can occur in any month with intensity of rainfall, rather than volume, normally determining the magnitude of flood peaks. Previous major floods have crested within 5 to 8 hours. The flood of August 1955 with a peak discharge of 112,000 cubic feet per second claimed 36 lives, damaged 2,200 buildings, and did $193 million damage. Since 1955 the Corps of Engineers has completed 7 flood control dams and has succeeded in protecting most of the flood plain subject to the 100 year flood. Modified peak discharges during the Intermediate Regional Flood and Standard Project Flood would be 23,000 and 58,000 cfs respectively, and would nevertheless flood residential, commercial and industrial sections. SPF channel and overbank velocities would be 10-20 and 2-4ft/sec respectively. (Henley-North Carolina)
W76-06919

SPECIAL FLOOD HAZARD INFORMATION: RAES CREEK, AUGUSTA AND RICHMOND COUNTY, GEORGIA,
Army Engineer District, Savannah, Ga.
Prepared for the City of Augusta and Richmond County, Georgia, January 1974. 25 p, 18 fig, 21 plates, 2 tab.

Descriptors: *Floods, *Flood plains, *Flood profiles, *Flood damage, *Flood peak, Flow characteristics, Non-structural alternatives, Flood proofing, Flood data, Peak discharge, Storms, Hurricanes, *Georgia.
Identifiers: Augusta(GA), Richmond County(GA), *Raes Creek(GA), Savannah River(GA), Cane Creek(GA), Intermediate Regional Flood, Standard Project Flood.

This report presents the flood situation along 7.5 miles of Raes Creek from its mouth on the Savannah River to Wrightsboro Road, 5 mile of Cane Creek from its mouth on Raes Creek to Interstate Highway 20, and 1 mile of the unnamed tributary from its mouth on Raes Creek to Oberlin road all in the vicinity of Augusta, Georgia (Population 70,650). Continued growth and industrial development is expected. The study area with a drainage area of 19.7 sq mi is highly developed and subject to flooding in all seasons of the year as the result of general rainfall, thunderstorms, and hurricanes. Development is taking place on the flood plain. Floods are generally characterized by a rapid rate of rise and high velocities. The Intermediate Regional Flood and the Standard Project Flood on Raes Creek would have peak discharges of 4,200 and 10,500 cubic ft/sec respectively. The IRF would flood residential, commercial and industrial properties covering 450 acres; the SPF would be disastrous, flooding 650 acres. Streets, roads, and public and private utilities would also be damaged. Development in the flood plain is expected to continue, resulting in an increase in storm runoff because of reduced infiltration, a reduction in the channel capacity due to increased deposits of sand and silt, and an increase in peak runoff rates because of the more efficient drainage system. This report suggests 'reasonable regulations' for guiding and controlling developments in flood hazard areas to prevent increases in flood damage in the future. 'Corrective measures may include flood proofing to make existing and proposed structures less vulnerable'. (Henley-North Carolina)

FLOOD PLAIN INFORMATION: KASKASKIA RIVER AND DRY FORK CREEK, DOUGLAS COUNTY, ILLINOIS, NO. 2.
Army Engineer District, St. Louis, Mo.
Prepared for County of Douglas, February 1974. 29 p, 7 fig, 18 plates, 5 tab.

Descriptors: *Floods, *Floodwater, *Flood profiles, *Flood plains, Streamflow forecasting, Historic floods, Peak discharge, Flow characteristics, Thunderstorms, Channel improvement, Dredging, *Illinois.
Identifiers: Standard Project Flood, Intermediate Regional Flood, *Kaskaskia River(IL), Douglas County(IL), Dry Fork Creek(IL).

The properties along these streams are agricultural, there being no industrial development at present and no development plans. Dry Fork Creek, with a total drainage area of 23 sq mi, is a tributary of the Kaskaskia River which drains 329 sq mi and flows eventually into the Mississippi River. Highwater has occurred in all seasons of the year, but flooding has occurred most often in April through June. Flooding results from intense thunderstorms after previous rainfall has saturated the ground. Floods occur in winter when intense rain falls on frozen ground. At least 8 floods occurred between 1943 and 1973, the largest recorded one being the flood of 1959 with a peak discharge of 4400 cfs. Four stream gages have been in operation for only a short time so that future floods were predicted using characteristics of the watershed and data from similar watersheds. During an Intermediate Regional Flood a peak discharge of 12,275 cfs is expected on the Kaskaskia River downstream of confluence with Dry Fork Creek, and 2295 cfs at the mouth of the Dry Fork Creek. Water velocities would vary between 1 and 6 ft/sec in the channel and 1 to 3 ft/sec in the overbank area. It is expected that maximum height would be reached in 7 hours, and the critical stage would last 35 hours. During a Standard Project Flood peak flows of 29,060 cfs and 7550 cfs are predicted on Kaskaskia River and Dry Fork Creek respectively. Maximum height would be reached in 11 hours and critical stage would last 63 hours. Most of the 21 bridges in the area would be obstructive in either major flood. Farms, houses and railroads would be subject to damage. (Smith - North Carolina)

DRAINAGE STUDY: HUNTER BROOK, SUCKER BROOK, COLDSPRING BROOK,
O'Brien and Gere Engineers, Inc., Syracuse, N. Y.
R. E. Copeland, and C. A. Richardson.
Report to Cayuga County Planning Board, Auburn, New York, June 1974. 44 p, 5 append. HUD CPA-NY-02-36-1001.

Descriptors: *Drainage, *Drainage programs, *Drainage engineering, *New York, Drainage systems, Surface waters, Watersheds(Basins), Streamflow, Runoff, Floods, Planning, City planning, Regional development, Water policy.

Identifiers: *Auburn(NY), *Cayuga County(NY).

This report identified present and future drainage problems and indicated the need for further study of drainage conditions in the Auburn, New York, area. Existing channel and culvert capabilities in the Hunter Brook Watershed are inadequate. Therefore no additional storm water from future development should be added to Hunter Brook. Field observations and detailed studies of the Sucker Brook Watershed led to recommendation that the proposed Auburn Estates project be drained into Sucker Brook. Investigation of Coldspring Brook Waterhsed indicated that existing drainage features are presently inadequate even for minor storms. Adequate drainage feature improvement combined with storage capacity of existing marsh area would minimize flooding problems. Other areas were briefly examined and existing and potential flooding problems can be avoided by adequate planning. A separate Drainage Review Board subordinate to the Cayuga County Planning Board should be established. (Sims - ISWS)

CONFLICT AND COALITION: POLITICAL VARIABLES UNDERLYING WATER RESOURCE DEVELOPMENT IN THE UPPER COLORADO RIVER BASIN,
California Univ., Santa Barbara. Dept. of Political Science.
D. E. Mann.
Natural Resources Journal, Vol. 15, No. 1, p. 141-169, 1975. 2 tab., 52 ref.

Descriptors: *Colorado River compact, *Political aspects, *Water resources development, *Colorado River Basin, Colorado, New Mexico, *Utah, Wyoming, History, Motivation, Decision making, Governmental interrelations, Water allocation(Policy), Preferences(Water rights), Interstate compacts, Water policy.
Identifiers: *Upper Colorado River Basin, Echo Park(Utah), Dinosaur National Monument(Utah).

Upper Colorado River Basin development is characterized as a reflection of distributive and regulative politics. Distributive politics involve a process of bargaining and accomodation among local interests to provide a united front on a basic legislative proposal in order to remove sources of conflict to passage of the bill. There is very little confrontation since the losers, the taxpayers, seldom have an effective voice in this type of political process. Regulatory politics usually involve sectional rather than local interests, involve issues of public policy, and tend to be fought by national associations. The policy implications are discussed more openly as each side attempts to broaden the conflict in order to gain allies. Examination of the history of the bargaining between interests in Colorado, Utah, New Mexico, and Wyoming and of the passage of the proposals shows the impact of the political distributive framework except when certain conservation or interregional issues are raised. The proposed dam at Echo Park in Dinosaur National Monument caused a major struggle with conservation groups and brought the Colorado Basin Projects into the arena of regulatory politics. Despite this occasional shift, the Colorado River Projects and water politics in general, continue to follow distributive politics thereby avoiding a critical examination of overall costs and benefits as well as possible alternatives. RIVER BASIN PLANNING - BASIC CONCEPTS FOR DECISION ANALYSIS AND PLANNING FOR GRADUAL EXPANSION OF THE INFORMATION BASE,
Economic Commission for Asia and the Pacific, Bangkok (Thailand).
R. C. Price.
UNDP/UN Interregional Seminar on River Basin and Interbasin Development, Working Paper No. 46, Budapest, Hungary, September 1975. 23 p, 3 fig, 1 tab, 6 ref. (United Nations, Department of Economic and Social Affairs).

Descriptors: *River basins, *Planning, *Decision making, *Multiple-purpose projects, *Water resources, Economics, Social aspects, Environmental effects, Evaluation, Information exchange.
Identifiers: Project expansion, Information base, Developing countries, Lower Mekong Basin.

For decision analysis and evaluation in river basin planning, the basic concept should involve the economic appraisal of all effects, favorable and unfavorable, economic, social and environmental. Such impacts may be at project site, upstream (i.e., in the reservoir flow), or downstream from the site. If, instead, an attempt is made to evaluate economic aspects on one hand and environmental aspects on the other, there is no common ground left for evaluation and decision assistance. The updating of the data base is as continuous as the river basin planning process itself. In early stages of planning, it is essential that collection of engineering, economic, social and environmental data be kept at a reconnaissance level to avoid waste of funds and effort. As the alternatives become more clearly defined and limited in the planning process, data are needed at feasibility level, so as continually to define the alternatives more precisely, along with their costs, benefits, social impacts and environmental effect. LEGAL AND ADMINISTRATIVE CONTROL OF THE IMPACT OF RIVER BASIN DEVELOPMENT ON THE ENVIRONMENT,
Fordham Univ. N. Y. School of Law.
L. A. Teclaff.
Working Paper No. 35, UNDP/UN Interregional Seminar on River Basin and Interbasin Development, Budapest, Hungary, September 1975. 23 p, 36 ref.

Descriptors: *River basin development, *Environmental effects, *Environmental control, *Legal aspects, Projects, Evaluation, Federal legislation, Cost-benefit analysis.
Identifiers: Developing countries, Administrative control, Environmental impact statements.

The benefits of river basin development are indisputable and have become so widely recognized that it was a long time before any adverse environmental effects began to be acknowledged. Systematic efforts to minimize such adverse impacts have so far been undertaken mainly in the industrialized countries, but some of the most severe damage has been caused in developing areas; rational water resources planning and management everywhere should take into account as many environmental factors and impacts as possible. Among the legal and institutional concepts devised to afford protection to the environment from large-scale water development are: consolidation and coordination of water resources management with environmental protection administration; the environmental impact statement; standards for the quantification of environmental factors so as to

permit comparison with factors traditionally incorporated in benefit-cost analysis; and guidelines for monitoring environmental impacts and evaluating ongoing and completed projects. Developing countries realize the importance of considering environmental effects, as is shown by one very recent national code. However, they often lack a data base and personnel adequate for achieving the complicated weighing of alternatives in an environmental context. U.N. agencies and international development organizations could do much to help by providing technical assistance and by evolving their own environmental evaluation procedures and standards for the river basin projects which they plan and carry out in developing countries. (Bell-Cornell)

THE ROLE OF PREDICTIONS IN WATER RESOURCES POLICY MAKING,
International Inst. for Applied Systems Analysis, Laxenburg (Austria).
A. Szollosi-Nagy.
Working Paper No. 57, UNDP/UN Interregional Seminar on River Basin and Interbasin Development, Budapest, Hungary, September 1975. 38 p, 3 fig, 3 tab, 37 ref, append.

Descriptors: *Runoff, *Control, *River basins, *Dynamic programming, *Stochastic processes, *Planning, Decision making, Algorithms, Methodology, Water quality control, Equations, Measurement, Hydrology, Linear programming, Biochemical oxygen demand, Mathematical models, Systems analysis, Optimization, Risks.
Identifiers: Prediction, Operating policies, System performance, Streeter-Phelps equation.

To get an effective control of large river basin systems, the decision maker wishes to develop optimal operating policies. To establish these policies, the future behavior of inputs, such as available resources, demand to be satisfied, etc., must be known or predicted. Because of the uncertainties inherent in water resources processes, both in quantity and quality, the prediction scheme to be constructed should be able to handle stochastic effects. Moreover, the algorithms should be recursive to avoid cumbersome computations and to be able to be used for real-time forecasting. This is especially important in case of emergency, e.g., flash floods. A general state space based formulation of water resources systems is given. It is shown that the general model of runoff control systems is able to handle different kinds of uncertainties. Optimal sequential prediction algorithms for linear discrete time stochastic water resource systems are presented. In the framework of runoff control, the case of optimal stochastic dynamic water quaity control is discussed and feedback control policies are established. The algorithms proposed might help the decision maker in working out the optimal operating policies for a large river basin system in the presence of different kinds of uncertainties. (Bell-Cornell)

INTERBASIN TRANSFER OF WATER RESOURCES,
International Inst. for Applied Systems Analysis, Laxenburg (Austria).
I. Belyaev.
Working Paper No. 56, UNDP/UN Interregional Seminar on River Basin and Interbasin Development, Budapest, Hungary, September 1975. 69 p, 11 fig, 11 tab, 45 ref. (United Nations, Department of Economic and Social Affairs).

Descriptors: *Water resources, *Inter-basin transfers, *Runoff, Technology, Economics, Ecology, Projects, Evaluation, Systems analysis, Hydrology, Rivers, Lakes, Oceans, Water quality, Management, Water policy, Water utilization, Colorado River, Human population, Planning, United States, Mexico, Mathematical models, Decision making.
Identifiers: Foreign countries.

This report gives an account of the present state of interregional interbasin river runoff transfers which are regarded as elements of natural and existing political-economic systems. The most well-known river runoff transfers on all continents are outlined along with their causes. They are: uneven and inadequate geographical distribution of water and other natural resources, uneven economic development of different regions, and uneven distribution of water resources over time. The alternatives of river runoff transfers are considered from the view point of resources of different types of water, the nature of their present use and the emergence of the relevant technical, economic and ecological problems. It is shown that transfers are often technically and economically preferable and have more obvious biological consequences than many other measures. Under certain circumstances, they are the only means of obtaining necessary amounts of water. Analysis of recently implemented and planned river runoff transfers reveals three important tendencies: (1) the requirements for transfer volumes increase; (2) more distant sources are being used; and (3) transfer projects become multipurpose. These tendencies cause complication of physical, engineering, economic, social and institutional aspects of the problem and complication of the design and management of systems. This paper deals with some modern methods of analysis and evaluation of transfer projects, including the system approach to the problem. (Bell-Cornell)

THE INTEGRATED RIVER BASIN CONCEPT AND INTERNATIONAL WATER RESOURCES MANAGEMENT,
United Nations Centre for Natural Resources, Energy and Transport, New York.
J. Souto-Maior.
Working Paper No. 59, UNDP/UN Interregional Seminar on River Basin and Interbasin Development, Budapest, Hungary, September 1975, 16 p. (United Nations, Department of Economic and Social Affairs).

Descriptors: *River basin development, *Water resources, *Management, *Planning, *International waters, Evaluation, Regions, Water quality control, Economics.
Identifiers: Drainage basins, National, International.

There are two closely related concepts which, although no longer strongly advocated in national water planning, are still much in vogue among those concerned with international drainage basin development. The first is the concept of the river basin as the appropriate unit for planning, not only water resources development, but also for regional development in general. The second is the concept of integrated river basin development proper. This paper discusses the viability of these concepts in international situations in the light of recent developments both at the national and international levels. The approach followed lays no claim to comprehensiveness. It consists of the evaluation of the drainage basin as a unit for planning and management where regional economic development is a goal, a typical situation among developing countries, and when it is used for water quality management, a common case among industrialized countries at present. The primary purpose of the paper should be considered the stimulation of discussion on these most critical issues. (Bell-Cornell)

SIMPLIFIED OPTIMIZATION OF WATER SUPPLY SYSTEM,
Nielsen and Rauschenberger A/S, Lyngby, Denmark.
H. J. Rasmusen.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. EE2, Proceedings paper No. 12026, p 313-327, April 1976. 5 fig, 10 tab, 8 ref.

Descriptors: *Water distribution(Applied), *Water supply, *Environmental engineering, *Optimization, Economics, Design, Pipelines, Pumping, Energy, Costs, Mathematical models, Equations, Systems analysis.
Identifiers: *Cost minimization.

A heuristic procedure for optimization of large-scale water supply network systems is presented. The method calculates a least-cost solution, considering the total discounted present value of pipeline investments and the running cost of maintaining the desired supply pressure. To solve the optimization problem the iterative procedure is applicable to branched as well as to looping networks. Herein, the diameter of each pipe sequentially is adjusted according to the ratio between marginal pipeline and energy costs. No rounding of diameters is required since available dimensions are used directly in the optimization. The procedure assumes that all nodal inflow and outflow requirements are known and that minimal service pressure requirements are specified. This methodology has been implemented and successfully applied to economic optimization of several large-scale water supply problems. (Bell-Cornell)

HYDROLOGIC AND ECONOMIC SIMULATION OF FLOOD CONTROL ASPECTS OF WATER RESOURCES SYSTEMS,
Hydrologic Engineering Center, Davis. Calif.
B. Eichert.
Technical Paper No. 43, The Hydrologic Engineering Center, Corps of Engineers, U.S. Army, Davis, California, August 1975. 8 p, 1 tab.

Descriptors: *Water resources, *Simulation analysis, *Hydrologic aspects, *Economics, *Flood control, Computer models, Computer programs, Flood damage, Reservoir operation, Evaluation.

The general capabilities and recent applications of the Hydrologic Engineering Center's computer model titled 'Simulation of Flood Control and Conservation Systems' (HEC-5C) are presented. The need for and the general capabilities of the model for detailed hydrologic and economic simulation of all types of water resource projects for flood damage reduction are stressed. The use of the model for planning studies that include alternatives such as reservoirs, levees, channel modifications, flood proofing, evacuation, and land use controls are described. Recent applications of the model in planning studies for several river basins are described. Comments on work underway to use the model for day-to-day reservoir operation during flood emergencies for existing flood control reservoir systems are offered. (Bell-Cornell)

FLOOD PROTECTION OF CRYSTAL RIVER UNIT 3 NUCLEAR PLANT,
Dames and Moore, Los Angeles, Calif. Ocean Sciences.
R. M. Noble, and B. Simpson.
Journal of the Power Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. PO1, Proceedings paper No. 11458, p 85-94, July 1975. 8 fig, 4 ref.

Descriptors: *Flood protection, *Florida, *Nuclear reactors, *Storm surge, Flood control, Floods, Storms, Evaluation, Hurricanes, Design, Water levels, Waves(Water).
Identifiers: Power.

To satisfy U.S. Atomic Energy Commission (AEC) safety criteria, a required evaluation of the worst site-related flood is performed for the Crystal River Plant, located on the Gulf Coast of Florida, where the probable maximum stillwater flood levels are likely to be a result of the probable maximum hurricane. Flood protection requirements for the Crystal River Plant are determined by considering the most severe combination of probable maximum hurricane parameters for the Gulf Coast Region. These parameters are used as input to a model of hurricane surge generation and attendant wave activity in order to determine the maximum flood levels at the Crystal River Plant. (Bell-Cornell)

Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Proceedings paper No. 12062, Vol. 102, No. WR1, p 101-115, April 1976. 2 fig, 1 tab, 29 ref. OWRT C-5184 (No. 4208) (3).

Descriptors: *Water resources, *Multiple-purpose projects, *Decision making, *Hydro-electric power, *California, *Optimization, Mathematical models, Reservoirs, Planning, Management, Operations research, Algorithms, Water policy, Linear programming, Dynamic programming.
Identifiers: *Central Valley Project(Calif).

System optimizing procedures are being developed for on-line use in the operation of the Central Valley Project in California, a complex multiple objective water resource system. The project is subject to requirements and interagency agreements. A practical optimization method must address not only these requirements but also the continuing needs of day-to-day operation, and the necessity for interposing the project managers in monitoring and final decision roles. The basic technical difficulty with an optimizing algorithm for a complex water resource system is the dimensionality which can easily run into the tens of thousands of decision variables and constraints. The method being developed for the project provides the necessary decomposition and involves the project managers, assisted by an integrated group of multiple policies based on interconnected monthly, daily, and hourly models, using iterated linear programming-dynamic programming techniques. (Bell-Cornell)

ANDRUS V. STATE (NEGLIGENT HIGHWAY CONSTRUCTION WHICH CAUSED FLOOD-WATER DAMAGE TO HOME).
541 P2d 1117-24 (Utah 1975). 8 p.

Descriptors: *Utah, *Judicial decisions, *Negligence, *Road construction, *Flood damage, Legal aspects, Water law, Penalties(Legal), Roads, Highways, Construction, Erosion, State governments, Basins, Runoff, Highway effects.
Identifiers: Sovereign immunity.

Plaintiff homeowners brought an action against defendant State of Utah and the State Highway Department to recover for damage sustained by the plaintiffs' property from flood waters. The plaintiffs contended that the damage was caused by negligent construction of a state highway which allowed quantities of water to collect in a basin created by the construction. These accumulated waters broke through an embankment flooding the plaintiffs' home. A jury found the defendants liable. On appeal the defendants contended that the highway was not negligently constructed, and that even if it was, the state was immune from liability in that highway construction is a discretionary state function. The Utah Supreme Court affirmed the trial court's decision, holding that the issue of the defendants' negligence was a question for the jury. Furthermore, although the decision to build the highway was a discretionary function, the state was not immune from negligence in the planning and supervising of the construction. (Nursey-Florida)

AN INTRODUCTION TO HYDROGEOCHEMICAL EXPLORATION,
P. B. Trost.
In: Water Resources Problems Related to Mining; Proceedings No. 18, June 1974. American Water Resources Association, Minneapolis, Minnesota, p 230-236. 3 fig, 2 tab, 10 ref.

Descriptors: *Groundwater, *Water chemistry, *Exploration, *Mineralogy, Chemical analysis, Chemistry, Geochemistry, Hydrogeology, Geology, Sampling, Analysis, Trace elements.
Identifiers: *Hydrogeochemical exploration.

The use of groundwater for geochemical exploration has been utilized in the U.S. and Russia since at least 1950. Targets most commonly sought have included uranium, massive sulfides overlain by glacial material, porphyry copper deposits buried beneath gravels, phosphate deposits, geothermal systems and crude oil and gas. The main advantage is the detection of mineralization which has little or no geologic expression. Samples have been collected from all types of water wells after they have been actively pumping for ten minutes or more. Analytical requirements are quite stringent since most trace elements are present in the parts per billion range. Interpretation is hindered by the lack of sufficient wells for detailed sampling, resulting in large (10-200 sq mi) anomalous areas. The future of groundwater geochemical exploration lies in refinement of the interpretation phase of the program. This must be done through integration of hydrogeological, and geochemical parameters of the groundwater system. So doing would then aid in determining anomalies associated with the desired target versus spurious or displaced anomalies. (See also W76-06938) (Sims-ISWS)

THE USE OF GROUND-WATER RESOURCES IN RIVER BASIN DEVELOPMENT,
Research Inst. for Water Resources Development, Budapest (Hungary).
G. Kovacs.
Working Paper No. 44, UNDP/UN Interregional Seminar on River Basin and Interbasin Development, Budapest, Hungary, September 1975. 24 p, 7 fig, 1 tab, (United Nations, Department of Economic and Social Affairs).

Descriptors: *River basin development, *Groundwater resources, *Water resources, Water demand, Hydrology, Economics, Surface waters, Equations.

The reliability of decisions concerning river basin development is influenced strongly by the alternatives considered and compared as equivalent solutions. One of the possible alternatives to meet the water demand is the utilization of groundwater resources. This paper analyzes some aspects of the hydrological and economic studies forming the basis of large-scale groundwater exploitation. Theoretical investigations and practical examples are presented. From these, the following conclusions have been made: (1) the utilization of groundwater resources should be considered as one of the alternative sources to cover water demand, especially in large sedimentary basins; (2) surface water and groundwater resources do not exist separately: they comprise one unit of water resources and their interaction must be investigated; (3) the quality of groundwater is generally suitable for direct human consumption, while surface waters need special treatment in most cases: it is reasonable, therefore, to give priority to urban and rural water supply needs in providing groundwater resources; and (4) the use of the natural storage capacity and artificial recharge of aquifers should be considered as a possible way of equalizing the fluctuation of the available water resources. STATE-OF-THE-ART OF GEOTHERMAL RESERVOIR ENGINEERING,
Hawaii Univ., Honolulu. Dept. of Civil Engineering.
P. K. Takahashi, B. H. Chen, K. I. Mashima, and A. S. Seki.
Journal of the Power Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. PO1, Proceedings paper No. 11455, p 111-126, July 1975. 3 fig, 2 tab, 23 ref.

Descriptors: *Aquifers, *Geothermal studies, *Powerplants, *Hawaii, *Reservoirs, *Wells, Energy, Hydrodynamics, Temperature, Testing, Mathematical models, Equations, Systems analysis, Research, *Reviews.
Identifiers: *Geotechnical engineering, Power, Systems engineering, Geothermy, Water flow.

This paper is a comprehensive survey into the 'state-of-the-art' in geothermal reservoir engineering. While there is general lack of hard quantitative data, rapid progress is beginning to be made in the field. The presentation takes the form of a survey paper and is in six parts: (1) the nature of geothermal reservoir; (2) geothermal reservoir engineering--hardware; (3) geothermal reservoir engineering--measurement and methods of analysis; (4) an international questionnaire; (5) what is geothermal reservoir engineer. and (6) geothermal reservoir engineering: research plan for the Hawaii Geothermal Project. The geothermal reservoir engineering research team is using computer and physical modeling and geothermal well testing/analysis. The computer modeling group hopes to predict the performance of geothermal wells and to study the environmental impact of the geothermal system, especially with respect to the stability of the Ghyben-Herzberg lens. The physical model is needed to balance the ongoing software investigations. (Bell-Cornell)

METHOD FOR DETECTING AND LOCATING WATER-PRODUCING ZONES AND/OR WATER THIEF ZONES IN SUBTERRANEAN FORMATIONS,
Continental Oil Co., Ponca City, Okla. (Assignee).
D. D. Sparlin, W. H. Fertl, and G. C. Young.
U.S. Patent No. 3,940,612, 4 p, 6 ref; Official Gazette of the United States Patent Office, Vol 943, No 4, p 1886, February 24, 1976.

Descriptors: *Patents, *Aquifers, *Water sources, *Groundwater, Geologic formations, Subsurface waters, Water storage, Water yield, Locating, Radioactivity techniques, Wells, Injection wells.

A method for locating water-producing zones and/or water thief zones in a subterranean formation penetrated by a well bore is described. The formation is injected with an aqueous solution containing from about 0.01 to 7.5 weight percent of an irradiated water soluble compound having preferential silica adsorptive characteristics. Radioactivity detection means are passed through the well bore and the measurement of radioactivity is recorded. The reservoir or injection well is returned to normal production or normal water injection. Radioactivity detection means are again passed through the well bore to record the measurement of radioactivity of the formation and the measurements of radioactivity are compared to determine water producing zones and/or water thief zones. 4C. Effects On Water Of Man's Non-Water Activities

WILDLIFE, ECOLOGY AND PLANNING IN A PROPOSED IRRIGATION SYSTEM,
North Dakota State Univ., Fargo. Dept. of Zoology.
J. J. Peterka.
North Dakota Water Resources Research Institute, Fargo, Completion Report No. WI-222-011-75, November, 1975, 46 p, 10 fig, 11 tab, 26 ref. OWRT-B-014-NDAK(2), 14-31-0001-3319.

Descriptors: Wildlife habitats, *Land use, Irrigation systems, *North Dakota, *Wildlife management, Ecology, Planning.
Identifiers: *Garrison Diversion(N Dak).

Interrelationships between past and present land use and wildlife population indices were studied to provide a guide for the development of a wildlife management plan for irrigated land. The study centered around a 20,000 acre area in southeastern North Dakota which will be the first area scheduled for irrigation in the Garrison Diversion Project; a total of 250,000 acres will eventually be irrigated under the project in central and eastern North Dakota. In Dickey and Sargent counties indices from 1946 to 1972 for pheasants, jackrabbits, cottontail rabbits, and mourning doves were compared with 16 land use variables by correlation analysis. The only interrelationship that could be satisfactorily explained was between pheasants and soil bank land from 1956 to 1969. Pheasant populations followed the same trends as the total acres of lad retired under the soil bank program. In the three 20,000 acre study areas in Dickey and Sargent counties, from 1970 to 1972, the amount of cultivated land and the availability of undisturbed habitat accounted for most of the variability in the pheasant population within the three study areas. Mourning doves were closely associated with trees and also to a somewhat lesser extent, with idle herbaceous areas. Populations increased between 1970 and 1971, and decreased in 1972, for pheasants, mourning doves, meadowlarks, jackrabbits, striped skunks, red fox and racoons. These population fluctuations were not associated with any land use change or other observable factors.
